The Stanford University Medical Center is a true academic medical center, one in which the research, education and clinical care missions of the school and the hospitals are, by design, interdependent. As such, this draft integrated clinical plan seeks to craft a means to achieve the success of each institution and of the medical center as a whole.

School of Medicine-Stanford Hospital & Clinics 2005 Initiative

The School of Medicine and SHC are cooperating in a clinic initiative whose purpose is to improve the quality of patient service. This is a most important effort aimed at incentivizing clinical departments and services leaders, faculty and staff to work with SHC to improve the patient experience. Under the guidance of Drs. Jerry Shefrin (Vice President, Ambulatory Care) and Joe Hopkins (Clinical Professor of Medicine, Family & Community Medicine), three cluster areas will be addressed over the coming year. These include:

1. Supply & Demand Management
2. Waits & Delays in Clinic
3. Telephone Services

I want to both add my strong support for the clinic initiative and encourage faculty and staff to lend theirs as well. In addition to the areas noted above, a program for improving communications with referring physicians will also be introduced in the 2nd Quarter of 2005.

Profile of Our New Graduate Student Class

I asked Ellen Porzig, Associate Dean for Graduate Education and Associate Professor of Developmental Biology and Human Biology, to provide an update on our new class of graduate students. Per Dr. Porzig, the entering class of graduate students is the largest and most diverse in the history of Stanford Biosciences Ph. D. programs. The 120 new students have come to Stanford from more than 75 universities and colleges around the world, including Argentina, Bahrain, Columbia, Great Britain, India, Mexico, Romania, Singapore, Turkey, Taiwan and Uruguay.

Currently, the first year graduate students in the Biosciences Programs are in their initial lab rotations and are also taking courses. For several quarters students rotate through 2 – 3 laboratories before deciding upon the lab where they will conduct their thesis research. Students have the option of choosing a laboratory from among 200 faculty in basic science and clinical departments.

Two of the most popular courses this quarter are Advanced Genetics (taught by Tim Stearns, Arend Sidow, Greg Barsh and Stuart Kim) and Biological Macromolecules, (taught by Jody Puglisi, Steve Block, Dan Herschlag, Karla Kirkegaard, Chris Garcia, Vijay Pande and David McKay).

To encourage new interdisciplinary collaborations between graduate students and medical students there are several new courses being offered this quarter, including: Multi-modality Molecular Imaging in Living Subjects, Project Class in Biomedical Informatics, Chemistry of Biological Processes, and Computational Analysis of Biological Images. New offerings later in the year include: Egg to Embryo: Basic Science and Clinical Approaches to Infertility (Winter Quarter) and Current Concepts and Dilemmas in Genetic Testing (Spring Quarter).

Dr. Porzig also reports that efforts are being made to foster more social interactions and friendships among the Ph.D. students and the M.D students including Ice Skating Party for the new students on the outdoor ice rink in Palo Alto this coming Friday evening October 22nd. That there is actually ice in Palo Alto is worth a visit in its own right!

Web-based System for Clerkship Evaluations

At the October 15th Executive Committee meeting, Dr. Myriam Curet, Associate Professor of Surgery, offered an introduction to the new Web-based clerkship evaluation system. The new system is the result of the efforts of a Working Group consisting of Sam LeBaron, Neil Gesundheit, Elizabeth Stuart, Char Hamada, Rex Chiu, Arthur Johnson, Arghavan Salles, Elizabeth Langer, ChaRandle Jordon, and Rebecca Trumbull, in addition to Dr. Curet.

By way of background, Dr. Curet pointed out that we have not done well historically in evaluating our students. More specifically, our Medical Student Performance Evaluations (MSPEs) are inadequate. As a result, too high a percentage of our students are not getting the residency interviews they desire, and they are not matching into the programs that they and we believe should be the case. Among the problems identified in the current clerkship evaluation system include inconsistency across sites and evaluators, as well as extensive turnaround time. There are insufficient direct observations of students and a lack of feedback and narrative comments to the students. Overall, the goals and objectives of clerkships are not clearly articulated.

The system Dr. Curet and her colleagues is introducing includes new evaluation forms as well as an emphasis on direct observation, timely and appropriate feedback, and useful narrative comments. Additionally, web-based tutorials have been developed for evaluators, clerkship directors, and students. These tutorials have been completed and may be found at http://med.stanford.edu/clerkship_eval/.

To implement the new system, I have prepared a letter to everyone who needs to take one of these tutorials to inform them that completing it is mandatory. The clerkship coordinators will distribute this letter and will track tutorial completion. Clerkship directors and department chairs will reinforce the importance of completing the tutorial. It will be crucial to have 100% compliance in implementing this new system.

It is extremely important that we improve our student evaluation processes, and the new clerkship evaluation system is a critical first step. Thanks to the Working Group for

tackling a very important School issue and for developing this much needed change in how we evaluate our students.

Fourteenth Annual Jonathan J. King Lectureship Features Human Fallibility in Medicine

On Tuesday October 12th, Dr. Atul Gawande delivered the 14th Annual Jonathan J. King Lecturship reflecting on his personal experiences as a young surgeon. Dr. Gawande has distinguished himself as a scholar, clinical investigator and writer. A graduate of Stanford, Dr. Gawande received his MD and MPH degrees from Harvard. He is also the author of *Complications: A Surgeon's Notes on an Imperfect Science*. If you haven't read this book already I would strongly recommend you do so.

Fall Forum on Community Health and Public Service

On Monday October 11th, the Third Annual Fall Forum on Community Health and Public Service was held in the Arrillaga Alumni Center. These events are the result of student advocacy, and they provide opportunities for them to share highly diversified research and community focused projects, which are both local and international in scope with each other and with faculty and staff. This year's Fall Forum included poster sessions as well as selected oral presentations. In addition, a keynote address was given by Dr. America Bracho, Executive Director, Latino Health Access, Santa Ana, on "The Role of Doctors in the Health of their Communities." I want to thank Shari Chavez, SMS V and Lauren Cochran, SMS II for their work in coordinating this year's Fall Forum. As evidence of progress, Community Health and Public Service was one of our original Scholarly Concentrations; and, in fact, this past year, was one of the most popular.

Stanford Hosts the California Tissue Engineering Annual Meeting

Thanks to the leadership of Michael Longaker, the Deane P. and Louise Mitchell Professor in the School of Medicine, and his colleagues, Stanford hosted the California Tissue Engineering Annual Meeting, which brought together investigators from throughout California to address the burgeoning field of tissue engineering and its relation to developmental biology and stem cell biology. This is truly a very interdisciplinary area of basic research that also has the opportunity to contribute important insights and applications to clinical medicine. It is also an area that is bringing together faculty from our Departments of Surgery and Developmental Biology as well as other departments along with the School of Engineering. Tissue engineering promises to be a fruitful area of research and has already been recognized by a recent NIH Award.

Exchanging Thoughts About School of Medicine Strategic Planning

On October 14-15th I had the opportunity to serve as the "Visiting Dean" at the University of Michigan (UM). Several years ago Dr. Alan Lichter, Dean at UM, initiated this program to foster an exchange of ideas and experience among deans and schools and academic medical centers. During this visit I gave a formal presentation about the status of our Stanford School of Medicine Strategic Plan *Translating Discoveries* and our

current efforts in implementing our planned initiatives in education, research, patient care, communication and advocacy. I also had the opportunity to meet with deans, faculty leaders and students at Michigan and compare notes on how we are each trying to solve the problems challenging academic medical centers. While we share a lot in common we certainly have a number of important differences in size, focus and expectations. But there is much we can learn from each other. Among the areas in which I believe Michigan has succeeded well is the funds flow relationship between the school and hospital. Their accomplishment in this area is perhaps best exemplified in their cancer center, but is likely to be relevant to other school-hospital relationships and this is particularly notable in their ambulatory programs. It is my hope that we can benefit from some of their experiences. More will follow on this topic in subsequent Newsletters.

Transforming the Lane Medical Library into the Knowledge Management Center

At the October 15th Executive Committee meeting, Debra Ketchell, Lane Library Director and Associate Dean for Knowledge Management, Office of Information Resources & Technology, provided an update on strategic planning and accomplishments since her arrival at Stanford in June, 2003.

Ms. Ketchell reviewed the vision of the biomedical knowledge management center (KMC) as a hub of knowledge and learning, virtually and physically, to support world-class patient care, research and learning. This vision centers on the user: saving time, fostering collaboration, enabling discovery, informing decisions, crossing traditional discipline boundaries and students, and embedding knowledge in everyday workflow. The strategic initiatives of the KMC are shaping into five areas: 1) developing a transparent digital library of knowledge sources and services available anytime, anywhere; 2) creating smart interfaces and search tools that put knowledge in context at the point of care, research or learning; 3) developing a collaborative learning hub that facilitates navigation and manipulation of knowledge content; 4) designing smart, collaborative learning spaces for students, trainees and instructors; and 5) developing a research program.

Ms. Ketchell also reviewed the accomplishments over the past year. Over 65% of our journal collection is now online with a goal of 80% in 2005. Over 460 new titles are now available back to volume 1. Almost 100% are available through a simplified NetID authentication for off-campus access. The new library website was released in late August. The new site sports the look and feel of the broader School site. A key organizing feature is the clinician and researcher portal, which initiates the library's effort to focus on user roles and personalization. Each of these portals includes a metasearch across multiple content sources that break down the compartmentalization of information by vendor package or agency. The metasearch approach is in part a "googlization" focuses on searching and allows the user to get started without knowing which particular content "bucket" would be most relevant. In addition, a bioresearch and a clinical "informationist" will be recruited for the next development phase.

Another new feature of the library website is finding online articles. The new PubMed@Stanford and Article Finder provide direct linking to all journal articles available in Stanford licensed content through an open standard article identification resolver. Previously, PubMed users were matching only about 60% of our total online collection and only searching the biomedical journal titles. If online isn't available, a link to print holdings or a interlibrary loan request form are offered. The ArticleFinder search on the eJournals page searches over 11,500 titles licensed across all Stanford libraries.

One of the cornerstones of building digital services and tools is the library liaison program launched last September. This program matches a dept, class or unit with a librarian who is a personal guide to customized updates, instruction, collection advocacy, and input for developing services. The same approach is used to support instructors developing digital content and instruction or training in the new tech-enabled classrooms. In addition, the library evaluated its instructional program over the past year and is refocusing on knowledge skills training. New initiatives include a scholarly research series in partnership with the Office of Postdoctoral Affairs, modeling course modules with the Dept of Surgery to that address the ACGME information management core competencies, and embedding information management skills in the Practice of Medicine course in the medical curriculum.

Ms. Ketchell also highlighted recent physical changes in current learning spaces, including the renovated Fleishmann and M classrooms, which provide flexibility for new teaching modalities. Learning space planning is now the work of the new Educational Technology group that became part of the knowledge management center in July. Library spaces have also been updated. The 24x7 student computing lab has new equipment and furniture, wireless access is available throughout, stacks came down, and new user spaces with comfortable furniture and electrical outlets for notebook users are now regularly in use. In development for January are a multimedia development lab to support faculty in developing new teaching using digital content and technology and a gateless entry to the library that includes a single help desk. These changes are opportunities to design the space and function of the new Learning and Knowledge building. Ms. Ketchell concluded that the emerging Knowledge Management Center it is all about getting the right knowledge, at the right time, to the right person, in the right context.

Ms. Ketchell and the entire staff of Lane Library have made enormous progress over the past year and are continuing to make huge contributions to all aspects of the School's work. The chairs expressed their appreciation for these efforts, as do I.

Another Season for the Bing Luncheon Series

On October 6th we opened another year of the Bing Luncheon Series. Since 1972 Helen and Peter Bing have hosted a luncheon presentation in Los Angeles that features a Stanford faculty member. Over the years a diverse and distinguished group of faculty has participated, four times each year, in this series that is now well regarded. This year's opening speaker was Dr. Sandra Horning, who reviewed the remarkable progress that she and her Stanford colleagues, most notably Dr. Ron Levy, have made in developing new

insight into the diagnosis and treatment of lymphomas. The Stanford team has pioneered a number of innovative approaches using immunotherapy, chemotherapy, radiotherapy and molecular diagnosis, and risk stratification. These are all wonderful examples of translational research, and Dr. Horning's presentation provided the Bing Luncheon attendees a special perspective on the important role Stanford plays in biomedical research as well as the impact of this research on patient care and outcomes.

Next Presentation of the Medicine for the Community Series

On Wednesday evening, October 6th, members of the Stanford and neighboring communities were invited to another lecture in our Medicine for the Community Series. This session featured presentations by Alan Schatzberg, Kenneth Norris Jr. Professor and Chairman of the Department of Psychiatry and Terrance Kotter, Associate Professor of Psychiatry and Behavioral Sciences and Chief of the Bipolar Disorders Clinic. Dr. Kotter provided an informative review of the linkages between creativity and mood disorders and Dr. Schatzberg reviewed the current and future approaches to the treatment of these disorders. The presentations were very well received by an enthusiastic community audience.

This free event represents an opportunity for faculty to communicate with our neighboring community about advances in science and medicine and the important role that Stanford is playing in generating new knowledge as well clinical interventions.

The next presentation of the Medicine for the Community Series will be on Wednesday, November 3rd at 7:00 p.m. Dr. Margaret Fuller, Chair, Department of Developmental Biology, will lecture on *Regenerative Medicine: A Hope for the Future* in the Clark Center Auditorium.

Lucile Packard Children's Hospital Leadership Forum

On Tuesday October 12th Chris Dawes, CEO of LPCH, and Dr. Ken Cox, Chief Medical Officer and Senior Associate Dean for Pediatric and Obstetric Clinical Affairs, hosted a semi-annual Leadership Forum that brought together faculty leaders and senior administrators from both the school and the hospital. This year's Forum featured poster presentations on key initiatives and accomplishments related to improvements in patient service, quality of care, customer processes, program planning, and financial management. Coupled with this were presentations on departmental updates (e.g., maternal-fetal medicine) and on some of the anticipated clinical and facilities challenges. I had the opportunity to address the group on "Forging a Successful Academic Medical Center Enterprise: The Stanford University School of Medicine and the Lucile Packard Children's Hospital." LPCH, still a young institution, has made great strides during the last several years. While important new programs have been established, many through the recruitment of stellar faculty, this rapid progress has been accompanied by considerable work-stress throughout the institution. Managing that stress and engaging the LPCH and SoM community in assuming proactive leadership roles are enormously important at this point in the institution's eye. Efforts such as this Leadership Forum

provide an important way to overcome barriers and foster the kind of interactions that are necessary to make LPCH and SoM as successful as they can be. In the end, this will translate to enhancing discoveries and innovations and ultimately making them available to improve the lives of children.

Awards and Honors

- ***Stanford Faculty Elected to the Institute of Medicine of the National Academy of Sciences:*** On October 18th two Stanford faculty members learned that they had been elected to the prestigious Institute of Medicine. They include **Dr. Rob Malenka**, the Nancy Friend Pritzker Professor in Psychiatry and Behavioral Sciences; **Dr. Bill Mobley**, John E. Cahill Family Professor in the School of Medicine and, by courtesy, of Neurosurgery and Director of the Neurosciences Institute at Stanford; **Dr. Mark Davis**, Burt and Marion Avery Professor in Immunology; and **Dr. Andrew Fire**, Professor of Pathology and of Genetics. Congratulations to all.
- ***The Neonatal Education Award in Perinatal Pediatrics*** has been awarded to Dr. David Stevenson, Senior Associate Dean of Academic Affairs and the Harold K. Faber Professor of Pediatrics. This award is given annually by the Section of Perinatal Pediatrics of the American Academy of Pediatrics to an individual for recognition of outstanding contributions in neonatal-perinatal medicine for health care students, professionals and the lay public. Congratulations Dr. Stevenson.
- ***The Karl Musshoff Prize*** has been awarded to Dr. Saul Rosenberg, the Maureen Lyles D'Ambrogio Professor in the School of Medicine. This award is for extraordinary scientific merits related to research in Hodgkin's Disease. Dr. Rosenberg received his award at the Sixth International Symposium on Hodgkin's Disease in September. Congratulations Dr. Rosenberg.

Announcements

- ***Grant Teaming Opportunities in Translational R&D:*** On Monday, November 1st at 1:00 p.m., representatives from SRI and the PharmaSTART program will give a presentation on NIH grant teaming opportunities to accelerate Drug Development by funding translational research and development activities. This presentation will address the challenges and opportunities arising from the changing funding landscape and the growing awareness of the potential role of the universities to accelerate drug development. Refreshments will be served at 12:00 p.m. prior to the presentation in Munzer Auditorium.
- ***New Director of Continued Medical Education Appointed:*** Dr. Julie Parsonnet, Senior Associate Dean for Medical Education, recently announced the appointment of Joshua Callman as our new Director of Continuing Medical Education (CME). Please contact Mr. Callman if you have any questions, plans or proposals for CME. He can be reached at 723-7286 or at jcallman@stanford.edu.

Dean's Newsletter

November 1, 2004

Don't forget to vote on Tuesday November 2nd. Needless to say this is perhaps one of the most important elections in generations and the immediate future of our nation and consequently the world will be impacted by the results of the Presidential election. As you also know there also are a number of initiatives on the ballot in California this year, some which impact health and science. I hope you will pay particular attention to Propositions 71 and 61 when you cast your ballots. Your vote will count!

BioX and Bioengineering at Stanford University

BioX, which brings together faculty and students from the life and physical sciences as well as from law and business, now numbers more than 270 faculty from 57 departments in the Schools of Medicine, Engineering, Humanities and Sciences, Earth Sciences, Law and Business. The BioX and its related Bioengineering initiatives stand as an exemplar of interdisciplinary research and education at Stanford and will be joined by the International Initiative and the Initiative on the Environment to define Stanford's broad commitment to the future.

On Friday October 22nd, the leadership of BioX (Matt Scott, Professor of Developmental Biology and Genetics and Chair of the BioX Leadership Council) and of Bioengineering (Scott Delp, Chair and Associate Professor of Mechanical Engineering and Paul Yock, Co-Chair and Martha Meier Weiland Professor of Medicine) met with the Scientific Advisory Council on the Interdisciplinary Biosciences to provide an update and status report as well as to receive critical feedback regarding future planning for this important initiative.

Based on the advice and recommendations of several visionary faculty members a planning committee for BioX commenced in 1998. Since then the BioX program at Stanford has evolved to facilitate collaborations and interactions among the fields of basic science, engineering and clinical science. The opening of the James H. Clark Center in 2003 created a home for BioX and the newly formed department of Bioengineering (the first interschool joint department at Stanford) as well as the opportunity to cross-fertilize interactions and collaborations between faculty throughout the university. Several key themes have been defined to date, with the understanding that they will evolve over time. At this juncture, the current BioX research themes include: Biocomputation, Biodesign, Biomedical Imaging, Biophysics, Brain and Behavior, Cell/Molecular Engineering, Chemical Biology, Genomics and Proteomics, and Regenerative Medicine.

BioX now includes a number of important programs. The ***Interdisciplinary Initiatives Program*** that has supported novel multidisciplinary research through highly competitive internal seed funding to help launch larger publicly funded research efforts. ***The Advanced Instrumentation Program*** has helped faculty to leverage matching funds from other sources to bring important and expensive equipment to Stanford or to help design

and build original equipment. The ***BioX Teaching Initiatives*** foster cross-disciplinary training for undergraduate and graduate students and postdoctoral scholars who come from different disciplines and programs. ***BioX Symposia and Seminars*** offer a forum to exchange data and ideas on cutting edge-research in the biosciences and biotechnology. Each of these programs/initiatives has met with success but all are now compromised by limitations in funding – obviously an important issue for the future.

In addition, the BioX Graduate Student Fellowships have been recently announced. Thanks to a generous gift from an anonymous donor, seven fellowships were announced for this year. All of the recipients are amazingly qualified students.

In tandem with BioX, the new Department of Bioengineering has gotten off to an excellent start under the leadership of Drs. Scott Delp and Paul Yock. The mission of the new Department of Bioengineering is “to create a fusion of engineering and the life sciences that promotes scientific discovery and the invention of new technologies and therapies through research and education.” Although the Department is just getting started, its goals are ambitious and include becoming ranked among the top five departments within five years and the Number One program in 10 years!

Fulfilling this important mission and achieving these ambitious goals will rest largely on the faculty and students who are recruited to join the new department. So far, Drs. Delp and Yock have gotten off to a great start, with wonderful new faculty recruitments. From a broad national search, three outstanding new faculty members have already been recruited. They are Steve Quake from Cal Tech, Jennifer Cochran from MIT and Karl Deissroth from Stanford. They are joined by current Stanford faculty who will have joint appointments in the department of Bioengineering. These include: Russ Altman, MD, PhD; Dennis Carter, PhD; Scott Delp, PhD; Greg Kovacs, MD, PhD; Norbert Pelc, ScD; Matt Scott, PhD; James Swartz, PhD; Charlie Taylor, PhD and Paul Yock, MD. In addition, a search for one to two additional new faculty members is being initiated and it is anticipated that over the next 5-10 years, a total of 20-24 new faculty will join this department – ideally bringing diverse and exciting backgrounds and skills.

While the quality of the faculty is certainly an important key to the success of the department, so too are the students who are selected to join the department. Although the applications period was limited to just a couple of weeks this past winter (due to the timing of the Academic Senate’s approval of the graduate program) over 350 students applied and 19 were selected. Each came with very strong backgrounds in engineering and biomedicine, per Dr. Delp they are a very bright and energetic group.

Progress is also being made in developing the bioengineering core curriculum under the leadership of Dr. Greg Kovacs, Professor of Electrical Engineering and, by courtesy, of Medicine. This will encompass a yearlong sequence of courses that teaches biology to the students in the program, who are expected to have a strong background in mathematics, physics and engineering. The evolving curriculum also requires students to take a "depth sequence" to assure that they graduate with disciplinary depth in addition to

interdisciplinary skills. This pattern mirrors our “scholarly concentrations” in the School of Medicine curriculum.

The future seems bright for the new Bioengineering Department, which, over the next several years, will recruit additional faculty and begin preparations for offering an undergraduate major. Equally importantly, the new department is evidence that collaboration between schools at Stanford can work, and this bodes well for larger interdisciplinary initiatives like BioX and the University-wide Initiative on the Environment and the International Initiative.

Appointment of Senior Associate Dean for Diversity and Leadership

I am very pleased to announce the appointment of Dr. Hannah Valantine, Professor of Medicine (Cardiovascular Medicine) as the first incumbent of a new School of Medicine leadership position – Senior Associate Dean for Diversity and Leadership. This role has been created to emphasize our commitment to enhancing diversity and to developing and supporting leadership across the School. Over the next several years this will be a major focus for the School.

Dr. Valantine is well qualified to assume this inaugural role. She has been on the faculty at Stanford since 1989 and currently serves as Co-Director of the Post-Transplant Cardiac Transplant Service as well as Director of the Post-transplant Clinical Research Program. In her research she has focused on understanding the mechanism mediating acute and chronic allograft failure and, in particular, on the role of microvascular injury in acute allograft failure as well as the mechanisms of mediating transplant coronary heart disease. Dr. Valantine has also played important leadership roles both at Stanford and more broadly. At Stanford, she has been a member of the Medical Student Admissions Committee, the Medical School Committee on Diversity, and the Medical School Faculty Senate. In addition, she was a member of the Stanford Committee for the Development of a Women’s Health Curriculum. Externally, she has served on the editorial boards of *Graft* and of *Ethnicity & Disease* and on the UNOS Scientific Advisory Committee. She has also been a member of the Board of Directors of the Western States Affiliate of the American Heart Association and has served as the Chairperson of its Advocacy Committee. I am delighted that Dr. Valantine will bring this wealth of experience and understanding to our efforts in diversity and leadership in the School of Medicine.

Putting Diversity and Leadership in the Forefront of our Next Retreat

During the next year we will be redoubling our efforts to place initiatives in diversity and leadership at the forefront of our School-wide Strategic Planning efforts. While the School of Medicine has made strides in achieving diversity among its undergraduate medical student body, and increasingly among graduate students, we have performed less well, in my opinion, in achieving diversity among our postgraduate trainees (residents and fellows) and faculty. To be a world-class medical school encumbers a responsibility to achieve a much deeper and broader level of diversity across our school, including students, staff and faculty. We will be examining a number of initiatives and approaches

and will be discussing them at our Annual Leadership Retreat in late January. Following that will come an implementation plan that I will share with you, and for which I will want to engage your help and support.

In addition to diversity, we will also be focusing on leadership development across our entire community. Equipping students, faculty and staff with leadership skills, as well as good citizenship, are all important to fostering an environment that will optimize individual as well as institutional success. This, too, will be a major topic at our January Leadership Retreat and also one about which I will send frequent updates beginning early next year.

Continuing Efforts to Achieve and Sustain a Respectful Workplace

In several past newsletters I have highlighted our commitment to assure that we do everything possible to provide a work environment that values the integrity and respect for our employees throughout the School of Medicine. I consider this one of our highest priorities. Last year, our efforts were focused on briefings for Faculty, as well as a pilot for a staff briefing. This year, our efforts will focus on the staff briefings. Ten departments have been scheduled for briefings so far over the next year, and others are in the process of being scheduled. These briefings will cover communication and a variety of respectful related behaviors in the academic workplace, along with resources to assist in addressing concerns that may arise. I encourage all School of Medicine staff to attend these briefings.

The sessions consist of a 45-60 minute briefing with time for questions and answers. The presenters will include some combination of the following:

Cori Bossenberry, Director of Human Resources
Norma Leavitt, Associate Director, Employee Relations
Jennifer Fortmann, Employee Relations Representative
Martha McKee, Ombuds
Ellen Waxman, Director of Faculty Relations

I strongly encourage all staff to arrange your schedules so that you will be present for these important sessions.

Competencies and Objectives for Medical Student Education

At the Medical School Faculty Senate Meeting on Wednesday October 20th, Dr. Julie Parsonnet, Senior Associate Dean for Medical Education, reviewed the criteria and components for assessing the competency of medical education at Stanford. These criteria, noted below, have been adapted from those put forth from the AAMC. Please review them and direct any comments to Dr. Parsonnet (parsonnt@stanford.edu). It is important to recognize that our medical education goals include the development of outstanding clinical knowledge and skills as well as evidence of scholarship and leadership.

1. Knowledge of the Basic Medical Sciences and Organ Systems

A graduate is expected to:

- Know the normal structure and function of the body (as an intact organism) and of each of its major organ systems
- Know the molecular, biochemical, and cellular mechanisms that are important in maintaining the body's homeostasis
- Know the various causes (genetic, developmental, metabolic, toxic, microbiologic, autoimmune, neoplastic, degenerative, and traumatic) of maladies and the ways which they operate on the body (pathogenesis)
- Know the altered structure and function (pathology and pathophysiology) of the body and its major organ systems that are seen in various diseases and conditions

2. Ability to Apply Clinical Skills in the Care of Patients

A graduate is expected to:

- Obtain an accurate medical history that covers all essential aspects of the history, including issues related to age, gender, sexuality, and socio-economic status
- Communicate with patients and their families in culturally appropriate ways regarding: sexuality and sexual function, domestic violence, substance abuse, financial obstacles to health, end-of-life issues, and other topics that materially affect patient well-being
- Communicate clearly, both orally and in writing, with patients, patients' families, colleagues, and others with whom physicians must exchange information in carrying out their responsibilities
- Conduct a thorough and accurate physical exam, including psychiatric, neurologic, genital, and orthopedic examinations in adults and children
- Perform routine technical procedures used in medicine and surgery
- Interpret the most frequent clinical, laboratory, roentgenologic, and pathologic manifestations of common maladies
- Reason deductively in solving clinical problems
- Construct appropriate management strategies (both diagnostic and therapeutic) for patients with common conditions, both acute and chronic, including medical, psychiatric, and surgical conditions, and those requiring short- and long-term rehabilitation
- Recognize and outline an initial course of management for patients with serious conditions requiring critical care
- Appropriately relieve pain and ameliorate the suffering of patients

3. Awareness of the Social and Community Context of the Practice of Medicine

A graduate is expected to:

- Demonstrate a commitment to advocate at all times for the interests of one's patients over one's own interests

- Demonstrate respect for the roles of other health care professionals and a willingness/commitment to collaborate with others in caring for individual patients and in promoting the health of defined populations
- Demonstrate a commitment to provide care to patients who are unable to pay and to advocate for access to health care for members of traditionally underserved populations
- Understand and work within existing healthcare systems in order to provide optimal care for patients
- Understand the various approaches to the organization, financing and delivery of health care

4. *Knowledge of the Principles of Evidence-based Medicine*

A graduate is expected to:

- Understand the important non-biological determinants of poor health and the economic, psychological, social, and cultural factors that contribute to the development and/or continuation of maladies
- Know the epidemiology of common maladies and the systematic approaches useful in reducing the incidence and prevalence of those maladies
- Understand probability, risk and cost-benefit analysis as they relate to disease risk factors, diagnostic tests, screening, and clinical decision making.
- Understand the power of the scientific method in establishing the causation of disease and efficacy of traditional and non-traditional therapies

5. *Commitment to Ethics and Professionalism*

A graduate is expected to:

- Know the theories and principles that govern ethical decision making, and of the major ethical dilemmas in medicine, particularly those that rise at the beginning and end of life and those that arise from the rapid expansion of knowledge of genetics
- Demonstrate compassionate treatment of patients, and respect for their privacy and dignity
- Demonstrate honesty and integrity in all interactions with patients' families, colleagues, and others with whom physicians must interact in their professional lives
- Know the threats to medical professionalism posed by the conflicts of interest inherent in various financial and organizational arrangements for the practice of medicine

6. *Commitment to Personal and Professional Development*

A graduate is expected to:

- Demonstrate the capacity to recognize and accept limitations in one's knowledge and clinical skills and a commitment to continuously improve one's knowledge and ability

- Demonstrate a commitment to engage in lifelong learning to stay abreast of relevant scientific, health care, and public health advances
- Demonstrate the ability to retrieve (from electronic databases and other resources), manage, and utilize biomedical information for solving problems and making decisions that are relevant to the care of individuals and populations
- Demonstrate a commitment to work collaboratively with colleagues in healthcare, research and leadership teams
- Demonstrate leadership in the various branches of medicine and the health sciences

7. *Commitment to an Area of Scientific and/or Clinical Inquiry*

A graduate is expected to:

- Recognize unresolved clinical or scientific questions, formulate an hypothesis, and identify methods and resources to address this hypothesis
- Conduct investigation in an area of interest related to patient care or scientific endeavor
- Understand the scientific theory and methodology that form the basis of medical discoveries
- Understand the ethical requirements for laboratory, animal-based and patient-oriented scientific inquiry
- Communicate new knowledge obtained from scientific inquiry responsibly and clearly

Efforts Underway to Establish a Center on Longevity

Thanks to the work of Dr. Tom Rando, Associate Professor of Neurology and Neurological Sciences, and Laura Carstensen, Professor of Psychology, as well as other faculty leaders in the School of Medicine and other Stanford schools, efforts are underway to establish a Center for Longevity at Stanford. Importantly, a Provost's planning committee has been established, and a recent meeting were generously hosted by Paul Brest at the Hewlett Foundation . In addition to Stanford faculty, participants included from Duncan Moore (optical engineer, University of Rochester), Robert Putnam (sociologist, Harvard), Irwin Feller (economist, AAAS), Marc Freedman (President, Civic Ventures, SF), Leonard Guarente (molecular biologist, MIT (by phone)), and Richard Suzman (National Institute on Aging). Based on this positive meeting, an internal Provost's Exploratory Committee was established that includes Lawrence Friedman, Karen Cook, John Shoven, Alan Garber, Tom Rando, Al Bandura, Bill Damon, Tom Andriacchi, Jon Krosnick, Chip Blacker, Randy Bean, Iris Litt, Mary Goldstein, and Jennifer Aaker.

A summary of the work to date can be found at <http://longevity.stanford.edu/> (*login: longevity, password: changingaging*). If you are interested in this initiative please contact Tom Rando or Laura Carstensen.

Honors and Awards

- ***Doris Duke Awards:*** On October 28th, the Doris Duke Charitable Foundation announced that it was recommending four distinguished scientists to receive the 2004 Distinguished Clinical Scientist Award in “Bench-to-Bedside Research.” This is the fifth year that this distinguished grant has been awarded. It is remarkable to note that two of the four individuals recommended for the award are at Stanford:
 - ***Dr. Sam Gambir***, Professor of Radiology: Project title: Molecular Imaging of Cancer with a Voltage Sensor
 - ***Dr. Robert S. Negrin***, Professor of Medicine: Project title: Regulatory T Cells in Bone Marrow Transplantation.

The recipients of this distinguished award each receive up to \$1.5 million to be used over 5-7 years “to support research teams translating scientific advances into new ways to prevent, diagnose, treat or cure disease.”

This is clearly wonderful news for Drs. Gambir and Negrin and also quite an achievement for Stanford. This is the first time that an institution has had more than a single recipient of the award. Congratulations to all!

- ***2004 SPIRIT Awardees:*** At the Staff Recognition Dinner on Thursday, November 4th, two individuals will receive the SPIRIT Award in acknowledgement of the outstanding contributions they have provided to the mission and vision of the School of Medicine. The two awardees are:
 - ***Jeannie Heschele***, Research Management Group Operations Coordinator
 - ***Woody Lorman***, Clinical Financial Analyst

Please join me in congratulating Ms. Heschele and Mr. Lorman.

- ***Dr. Edward Harris***, George DeForest Barnett Professor of Medicine, Emeritus, received the Distinguished Rheumatologist Award from the American College of Rheumatology during the ACR Annual Scientific Meeting last week. The Distinguished Rheumatologist Award is awarded each year to an ACR member who has made outstanding contributions in the areas of patient care, clinical scholarship or service to benefit patients with rheumatic diseases.
- ***Dr. Craig Miller***, Professor of Cardiothoracic Surgery, has been named the recipient of the Santa Clara Medical Association’s 2004 “Outstanding Achievement Award in Medicine”.

Announcements

Community Faculty Lecture Series: The next presentation of this series will be held on Wednesday, November 3rd at 7:00 p.m. Dr. Margaret Fuller, Chair, Department of Developmental Biology, will lecture on *Regenerative Medicine: A Hope for the Future* in the Clark Center Auditorium.

This free event represents an opportunity for faculty to communicate with our neighboring community about advances in science and medicine and the important role that Stanford is playing in generating new knowledge as well clinical interventions.

Appointments and Promotions

- **Aijaz Ahmed** has been reappointed to Assistant Professor of Medicine (Division of Gastroenterology and Hepatology) at the Stanford University Medical Center, effective 1/1/2005.
- **Russ Altman** has been promoted to Professor of Genetics and of Medicine and also, Professor, by courtesy, of Computer Science, effective 11/1/2004.
- **Carol Conrad** has been reappointed to Assistant Professor of Pediatrics (Pulmonology) at the Lucile Salter Packard Children's Hospital, effective 2/1/2005.
- **Yasser El-Sayed** has been reappointed to Associate Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 10/1/2004.
- **William Fearon** has been appointed to Assistant Professor at the Stanford University Medical Center, effective 10/1/2004.
- **Gregory Hammer** has been promoted to Professor of Anesthesia and Professor and by courtesy, of Pediatrics in the Stanford University Medical Center, effective 10/1/2004.
- **Griffith Harsh** has been appointed to Professor of Neurosurgery at the Stanford University Medical Center, effective 2/1/2005.
- **M. Bruce MacIver** has been reappointed to Associate Professor (Research) of Anesthesia, effective 7/1/2005.
- **Michael Moseley** has been promoted to Professor of Radiology, effective 10/1/2004.
- **Judith Shizuru** has been promoted to Associate Professor of Medicine. effective 11/1/2004.
- **R. Lane Smith** has been reappointed to Professor (Research) of Orthopedic Surgery at the School of Medicine, effective 11/1/2004.
- **Simon Stertzer** has been appointed to Professor of Medicine at the Stanford University Medical Center, effective 10/1/2004.
- **Dee West** has been appointed to Professor of Health Research and Policy at the School of Medicine, effective 11/1/2004.

Dean's Newsletter

November 15, 2004

California Takes a Major Step Forward in Stem Cell Research

On Tuesday November 2nd the citizens of California spoke definitively in favor of stem cell research by the passage of Proposition 71. As you probably know, Prop 71 will provide \$3 Billion over the next decade to support this important area of research in California. As you also know, stem cell research has been a highly politicized topic during the past 2-3 years and, in no small part because of Stanford contributions in research and advocacy, became a source of debate during the recent presidential election. I guess it would be somewhat revealing of my own personal viewpoint to say that the passage of Prop 71 (as well as 61) was one of the only positive things that occurred on Election Day 2004.

With the passage of Prop 71 comes an enormous responsibility and accountability. It will now be our job to assure that the very best science is performed and that all studies are conducted with the highest ethical standards. It will be incumbent on us to assure that the support and investment by our fellow citizens in California result in fundamental new knowledge about stem cell biology and its relationship to developmental biology and regenerative medicine. While it is easy to become hyperbolic in suggesting that this research will lead rapidly to new treatment strategies, I do firmly believe that innovations will be developed in the years ahead that will have a major impact on improving the lives of adults and children with serious medical illnesses. These include cancer, diabetes, heart disease, and neurodegenerative disorders, among others. But such progress will take time and can only result from careful and rigorous experimentation.

Our public and private academic institutions and research institutes have the prospect – and, I would add, responsibility – to become the national leaders in stem cell research. While the resources will need to be committed with the highest rigor, they should enable our institutions to develop the infrastructure and facilities to carry out this important work by supporting innovative science and recruiting new talent to contribute to our mission and join our institutions. I hope that we will engage individuals from diverse and different disciplines who will approach these exciting challenges from different perspectives and who will engender new ways of thinking and problem solving. I further hope that the research agenda that evolves will promote new levels of cooperation and collaboration among our various institutions and centers in California. Additionally, I hope that we will collectively further advance and promote the national discussion on this topic, from its basic science and ethics to its implications for therapeutic intervention.

A range of committees and oversight groups will oversee Prop 71. On November 5th, State Controller Steve Westly appointed me to serve on the Independent Citizen's Oversight Committee. I view this as an important personal responsibility. Some might argue that it will be difficult for individuals to serve on the Oversight Committee when their own institution serves to benefit from funding from Prop 71. I certainly understand and respect that concern. But I also recognize that leadership – whether as the dean of a

medical school or a member of a scientific advisory group in the public or private sector – requires putting the rigor and significance of the science before any institutional consideration. Interestingly, even more than other committees or boards on which I have served, the title of “*Citizen’s*” Oversight Committee addresses a special responsibility. It will be incumbent on each member of this committee – or the science review boards – to approach this responsibility as a citizen first. In this case that means assuring to the very best of our ability that the commitment and investment that our fellow citizens have made by the passage of Prop 71 results in the highest quality outcomes. Certainly that is how I will approach this important responsibility.

Another Step Toward Our Application to Become an NCI-Designated Comprehensive Cancer Center

I have discussed in prior Dean’s Newsletter our plans to become an NCI-Designated Comprehensive Cancer Center. Over the past 18 months we have made considerable strides in advancing our planning efforts, due largely to the untiring efforts of Dr. Karl Blume, Professor of Medicine, Emeritus, and Associate Director of the Cancer /Stem Cell Institute. During this period we have defined the eight major programs and share resources (or cores) that will comprise our grant application (see below). We have also formed an important collaboration with the Northern California Cancer Center (NCCC) that will enhance our efforts in cancer epidemiology and population research. This collaboration has been enriched by the appointment of Dr. Dee West, of the NCCC, as Professor of Health Research and Policy at Stanford. In tandem, we are also expanding our faculty in cancer biostatistics with the appointment of Dr. Phil Lavori, Professor of Health Research and Policy, as the leader of this program along with the planned recruitment of additional faculty in clinical epidemiology and biostatistics. Of course our greatest strength lies in innovation and technology development – a fact that was certainly well appreciated by the review from our External Advisory Board this past March (see March 22nd Dean’s Newsletter at http://deansnewsletter.stanford.edu/archive/03_22_04.html#4).

One of the other major critical components of our planned proposal to the NCI has been identifying the Principal Investigator (PI) for the grant application. During the past year the Steering Committee of our Cancer/Stem Cell Institute reviewed a series of candidates, focusing on individuals who are outstanding scientists. While our initial hope had been to recruit an external leader, I have decided that we will make greater progress with an internal scientist and I have asked Irv Weissman, the Director of the Cancer/Stem Cell Institute, to serve as the initial PI. I am very pleased to announce that Dr. Weissman has agreed to do so. Dr. Weissman brings enormous distinction and credibility as a scientist and leader. Our current plan is to complement Dr. Weissman’s leadership through the appointment of a strong Deputy Director, and a search for this individual is now underway.

Accordingly, the current plans for our NCI application has an array of projects, including:

1. Basic Science Programs

<i>Project</i>	<i>Principal and Co-Investigators</i>
Cancer/Stem Cell Biology	I. Weissman, R. Nusse
Radiation Biology	A. Giaccia, Q. Le
Cancer Biology	M. Cleary, L. Boxer
Cancer Imaging	S. Gambir, C. Contag

2. Clinical Science Programs

<i>Project</i>	<i>Principal and Co-Investigators</i>
Systematic Molecular Profiling of Cancer	P. Brown, S. Jeffrey
Lymphoma and Hodgkin Disease	R. Levy, S. Horning
Immunology and Immunotherapy of Cancer	E. Engleman, M Davis
Adult and Pediatric Hematopoietic Cell Transplantation	R. Negrin

3. Population Science programs

<i>Project</i>	<i>Principal and Co-Investigators</i>
Cancer Epidemiology/Cancer Prevention/Outcomes Research/Patient Education	D. West, A. Whittemore

In addition, the following group of Cores will be a critically important part of the grant application:

<i>Shared Resources (Cores)</i>	<i>Principal and Co-Investigators</i>
Biostatistics Core for Cancer Research	P. Lavori, B. Brown, T. Lai
Clinical Trials Support Office	G. Fisher
Protocol Review and Monitoring Systems	S. Knox, S. Horning, R. Carlson, S. Srinivas
Informatics Core	H. Lowe
General and Specialized Animal Colonies	R. Tolwani, M. Garcia
Transgenic and Knockout Mice	M. Cleary, D. Felsher, Y. Chen Tsai
Cell and Tissue Distribution	J. Pollack, J. Norton
Cancer Imaging	C. Contag, S. Gambir, B. Daniel
Confocal and Immunoelectron Microscopy	S. Smith, J. Mulholland
Flow Cytometry	G. Nolan, L. Herzenberg
DNA Microarrays	G. Sherlock, M. Fero, C. Ball
High throughput Genomic Analyses	R. Davis, M. Mindrinos, W. Xiao, H. Ji

And there are some developing programs as well. These include:

<i>Developing Programs</i>	<i>Program Leaders</i>
Biomedical Informatics and Biomedical Computation	M. Musen, S. Plevritis

Pediatric Cancer Research	M. Link, G. Dahl
Cancer Pharmacology and Experimental Therapeutics	B. Sikic, K. Cimprich
Genetics of Solid Tumors	J. Ford, R. Davis

While the proposal will contain an broad array of activities, it will also have an additional, unique component arising from Dr. Weissman's quest for cancer stem cells and for the ultimate development of disease specific cancer stem cell lines generated by nuclear transfer experiments. The initiation of these studies will engage faculty from a number of departments and will also include the recruitment of new faculty members. Because laboratory space is so very limited at this moment, the locus of the activity will likely take place at 1050 Arastradero, which we are now referring to as the "vineyard" (since it truly has one in its front yard) until our Stanford Institutes of Medicine building is constructed, hopefully within the next 3-4 years.

I also recently had the opportunity, during a recent trip to New York City, to review our developing plans in this area with the executive and scientific directors of the Ludwig Institute. They were quite excited by our overall plans for cancer research, our unique focus on cancer/stem cell biology, and my decision to appointment Dr. Weissman as our PI.

Our association with the Ludwig Institute as well as the NCI will help shape our future programs in cancer research. While we have considerable work to do, I am pleased with our progress to date and enthusiastic about the immediate challenges and opportunities that stand before us.

Facilitating Translational Research: The PharmaSTART Initiative

I have previously described the formation of PharmaSTART as a unique collaboration between Stanford, UCSD, UCSF, UC-Berkeley and Stanford Research Institute (SRI) to foster and develop early development of targeted therapies (see January 24th Dean's Newsletter http://deansnewsletter.stanford.edu/archive/01_12_04.html). On November 1st, Dr. Ted Spack, Senior Director of the PharmaSTART Program, gave a presentation at Stanford on "Grant Teaming Opportunities in Translational Research and Development"

Over the past several years funding from biotech has shifted to later stages of drug development. This change has resulted in decreased funding for start-ups (with fewer spinouts from single discovery/technology); decreased licensing of academic projects and chaperoning by venture capitalists; and greater potential gaps in the product pipeline. Various institutions have sought to address this challenge in different ways, including a consortium model like PharmaSTART. In this model, SRI - provides its preclinical expertise for the development of targeted chemical or biological agents, focusing particularly on formulation, toxicity, pharmacokinetics and adverse drug interactions. These are all important components or prerequisites to Phase I/II clinical trials. The advantage of the consortium is that it brings together several leading institutions that can collaborate and form the nexus for a regional translational network.

If you wish to learn more about PharmaSTART feel free to contact Dr. Harry Greenberg, Senior Associate Dean for Research (Harry.Greenberg@stanford.edu) or, at SRI, Dr. Ted Spack, PharmaSTART Director (ted.spack@sri.com), Bob Dehn, Director of Government Grant Teaming (bob.dehn@sri.com), or Jim McNamara, Director of Business Development (jim.mcnamara@sri.com).

Update on The Stanford/Packard Center for Translational Medicine (SPCTRM)

For almost two years, representatives of the leadership of SUMC as well as the University, in recognition of the need for an improved infrastructure and support system for clinical and translational research, have been engaged in a collaborative effort to re-engineer the entire clinical research enterprise. One of their major thrusts has been the development of the Stanford/Packard Center for Translational Medicine (SPCTRM). SPCTRM, which will be officially launched within the next several months, will be a multi-disciplinary service organization with the goal of enhancing the quality of clinical and translational research performed at Stanford. It will provide comprehensive collaborative support, education, training, and research infrastructure development for members of the Stanford clinical research community. SPCTRM will be a program of integrated services designed to assist the clinical investigator every step of the way from protocol design and development, to study completion and close out, to data analysis.

In addition, SPCTRM will assume the research coordinator education, training and monitoring functions previously performed by the School's clinical trials office, ACCESS (Academic Consortium for Clinical Excellence in Scientific Studies). It is also developing new educational programs directed toward investigators and trainees. SPCTRM will provide the following services:

- Assistance with protocol development via biostatistics and informatics consultation services.
- Study budgeting.
- Contracting.
- Automated billing, accounting, and internal financial auditing.
- Sponsor billing and study closeout.
- Internal compliance monitoring.
- Outpatient clinic space.
- Clinical laboratory consultation and samples processing.
- Study source document archiving.
- Research coordinator services: education, orientation and training; health screening; competency testing.
- Faculty investigator education and training.
- Assistance with external audits and reviews.
- Ombudsman and single point of contact for clinical research issues.
- Stanford Clinical Trials Website

Two dedicated groups have been working on these issues. The Stanford/Packard Task Force on Translational Medicine consists of: Steve Alexander, Harry Greenberg, Nick Gaich, Connie Hartnett, Carole Klove, David Haray, Gary May, Ann James, Pamela Webb, Dale Jung, Susie Lu, Steve Jun, Jim Zehnder, Debra Mattman, Miriam Bischoff, Todd Ferris, Nancy Lee, Renee Ritlet, and Brandy Sikic. The SPCTRM ad hoc Working Group includes: Steve Alexander, Harry Greenberg, Alexa Kimball, Mark Genovese, Chris Zarins, Lorrin Koran, Branimer Sikic, Ken Cox, Norm Rizk, Rick Kraemer, Bill Brown, Bill Mobley, Henry Lowe, and Phil Lavori. Many thanks to all for their efforts.

I will keep you informed about the further developments of SPCTRM. I am gratified to see the progress that has been made to date, and I look forward to seeing the implementation of its programs in the near future.

Community Lecture Series on Regenerative Medicine

On Wednesday November 3rd, a wonderful presentation in our Medicine for the Community Lecture series was given on the Promise of Regenerative Medicine – a most timely event in light of the passage of Proposition 71. Special thanks go to Professors Minx Fuller, Seung Kim and Michael Longaker for an enormously informative evening that addressed the spectrum from basic developmental biology to stem cell biology and applications in regenerative medicine. These evening sessions continue to be well attended by diverse and receptive audiences.

The next session in this series will be “Skin Cancer” on February 2, 2005 presented by Drs. Hayes Gladstone, Youn H. Kim, Anthony Oro, and Susan Swetter.

Stanford Hosts the California Healthcare Initiative

On November 9th the Stanford University School of Medicine hosted the California Healthcare Institute’s (CHI) 2004 Policy Forum. The meeting brought together federal and state policy makers with leading biomedical researchers and biotech industry leaders to discuss public policy issues related to bringing breakthrough treatments from the lab to those suffering from disease. We were also very happy to host Congresswoman Anna Eshoo, one of the forums’ keynote speakers and our hometown representative, who has done so much to support biomedical research from her post on the House Energy and Commerce Committee. The Stanford community was well represented during the event, including presentations by Dr. Paul Berg, the Robert W. and Vivian K. Cahill Professor of Cancer Research Emeritus, on the future of stem cell research in California after the passage of Proposition 71 and Dr. Alan Garber, the Henry J. Kaiser Jr. Professor of Health Research and Policy, on the public policy issues related to assessing the economic value of biomedical innovation. This was the second CHI event we have hosted at Stanford and we look forward to continued dialogue on these important issues.

Evolving Program in Genomics and Human Genetics

As I discussed in the October 4th Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/10_04_04.html#1), we are in the process of forming three Strategic Centers that will form a matrix with our Stanford Institutes of Medicine. They will further enhance the linkage between basic science and clinical medicine and, in so doing, will foster Translating Discoveries (see Strategic Plan <http://medstrategicplan.stanford.edu/>). The three Strategic Centers (this descriptor may well change) include Genomics and Human Genetics (led by Dr. Rick Myers, Stanford W. Ascherman M.D., F.A.C.S. Professor of Genetics), Clinical Informatics (led by Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology) and Clinical Imaging (led by Drs. Gary Glazer, Emma Pfeiffer Merner Professor in the Medical Sciences, and Sam Gambir, Professor of Radiology).

Planning for the Genomics and Human Genetics and the Clinical Informatics Enabling Centers is well underway. On Saturday, October 30th, a Genomics and Human Genetics Retreat was attended by more than 50 faculty, with many more expressing an interest in this new effort. It focused on a broad scientific agenda and especially on various experimental model systems for genomic approaches and how these inform human genomic research. As an outcome of the retreat a weekly series of faculty meetings will be launched in December as a forum for further shaping the agenda and focus of this Center.

A number of initiatives are already being planned, including training grant proposals, developing means for faster dissemination of exciting new technologies developed within Stanford, exploration of ways to better link our two major genome centers, mechanisms for enabling model organisms to “feed off” of one another, better access to existing clinical samples, clearer definition of how proteomics will contribute to the genomics initiative, improved infrastructure support for genetic epidemiology, overall facilities and program support for important initiatives, and greater physician involvement. This of course is just a start since this exciting initiative will be further shaped over the next weeks and months. Faculty who have an interest in this new effort should contact Rick Myers (Myers@SHGC.stanford.edu).

Meeting on Immersive and Simulation Learning

An exciting program of events is occurring on Monday, November 15, 2004 to launch the School of Medicine's new initiative on immersive and simulation-based learning (ISL). Session I features distinguished guest speakers, including outside experts on immersive and simulation-based learning in both surgical and a variety of dynamic non-surgical fields. In addition, leaders of Stanford's four founding centers of simulation activity are giving highlights and demonstrations of their work. Speakers for the morning event include:

- **Henry Lowe, M.D.**, Senior Associate Dean for Information, Resources, and Technology

- **David Gaba, M.D.**, the newly appointed Associate Dean for Immersive and Simulation-based Learning at Stanford School of Medicine. This new office will develop programs to encourage Stanford faculty to create, deploy, and integrate applications of ISL for education, training, research, and improvement of clinical care. Strategic planning is currently underway toward the intended establishment of a Center for Immersive and Simulation Based Learning.
- **Ajit Sachdeva, M.D.** Director, Division of Education, American College of Surgeons. The ACS is actively engaged in delineating mechanisms to bring simulation-based training to its members and to residents in training.
- **Amitai Ziv, M.D.**, Director, Israel National Simulation Center, Chaim Sheba Medical Center. This national simulation center is involved with a large number of applications in a diverse set of medical fields. The unique needs and small size of this country promote innovative national solutions to critical requirements of training and assessment.
- **Lou Halamek, M.D.**, representing the Center for Advanced Pediatric Education (CAPE)
- **Thomas Krummel, M.D.**, representing the Center for Simulation in Medicine (CSIM),
- **Parvati Dev, Ph.D.**, representing Stanford University Medical Media and Instructional Technology (SUMMIT),
- **Steve Howard, M.D.**, representing the Patient Simulation Center of Innovation at VA Palo Alto Health Care System (PSCI).

Session II is a gathering for Stanford faculty and invited guests to discuss the opportunities, structures, and resources for the implementation of ISL across the entire school and affiliated hospitals. The session also addresses where and how ISL might fill gaps in the education and training of clinicians ranging from students to experienced practitioners. The program information can be found at <http://med.stanford.edu/irt/immersive/>. This is an exciting new undertaking for the Stanford University Medical Center, and I am confident that it will elicit broad interest both within the School and externally.

Updates from Information Resources and Technology

Dr. Henry Lowe, Senior Associate Dean for IRT asked me to share the following two announcements with you:

New Research Data management Services from Information Resources and Technology

The IRT System Development division, under the direction of Phil Constantinou, is being renamed Systems Development and Data Management to reflect that division's new role of providing research data management services to the SUMC community. These new services will include consultation on research data management options, design and implementation of research databases, design and development of research applications and, in close collaboration with IRT's IT Services and Security & Privacy groups, ongoing operation of research data

management systems. These new services will be deployed incrementally in close collaboration with the Stanford research and biostatistics community. Dr. Lowe and I am very grateful to Phil Constantinou, and his team, for taking on this important responsibility and have great confidence that they will provide excellent services supporting the School's research mission. For full information about Systems Development and Data Management please see <http://med.stanford.edu/irt/development/>

Creation of New Public Web Services Division within Information Resources and Technology

Dr. Lowe and I are pleased to announce the promotion of Michael Halaas to Director of Public Web Services within IRT. This new division, under Michael's leadership, provides general oversight for the School of Medicine's web presence and a wide range of support for the more than 300 public websites associated with the school. Public Web Services sets web publishing standards and policies, provides training and support for departmental web authors, and builds websites for groups across the school. Earlier this year, the group began a major renovation of the school's website and is in the midst of rebuilding sites for all departments, centers, and institutes into a common and flexible design framework with the goal of providing strong coordination of the various public facing web-related activities. The group also builds and manages web applications associated with the public web including CAP (Community Academic Profiles), a system for publishing and managing profiles for our faculty and researchers. For full information about the Public Web Services division please see <http://med.stanford.edu/irt/web/>

Annual Celebration to Recognize Our Staff Employees

One of the most wonderful events each year is the Dean's Staff Recognition Dinner. This event allows us to thank School of Medicine staff who have served for 5, 10, 15, 20, 25, 30, 35, 40 and (even) 45 years of service. I want to begin by thanking our Human Resource Department, led by Ms Cori Bossenberry, and Michael Hindery, our Senior Associate Dean for Finance and Administration, for making this event so successful. As I meet the individuals who are being honored at this event, I am comforted by how dedicated and committed they are to Stanford. There is no doubt that many have experienced all the stresses and strains that go along with working in the intense environment that defines a modern academic medical center. But an individual and collective commitment, wisdom and dedication were abundantly visible at this annual celebration and are what helps to make our Medical School so truly excellent. Whether serving as administrators, research technologists, animal caretakers, communicators, fundraisers, or in any of the many other roles in the School, each employee brings a unique and special perspective and personal set of talents. I want to thank each one for his or her many contributions.

Having myself been part of the Stanford community for less than four years, it is gratifying (and humbling) to note how many individuals have served Stanford for two, three and four or more decades. These individuals are listed below and include:

20 YEAR EMPLOYEES

<i>Stuart Anhorn</i>	Comparative Medicine/Vet Service Ctr
<i>Rose Sage Barone</i>	SOM/IRT Operations
<i>Gail Benson</i>	Anesthesia
<i>Francena Brumbaugh</i>	Medicine/General Internal Medicine
<i>Jim Day</i>	SOM/Visual Art Services
<i>Maria Bernardette De Souza</i>	Pathology/Blood Center
<i>Sharon Dickow</i>	Medicine/Immunology & Rheumatology
<i>Emily Gere</i>	Psychiatry
<i>Kathryn Gillam</i>	SOM/Dean's Office Operations
<i>Charlene Hamada</i>	SOM/Student Affairs
<i>Katherine Ishizuka</i>	Pathology
<i>Vivian Jones</i>	SOM/Facilities Planning & Mgmt
<i>Sharie Kumaishi</i>	SOM/IRT Operations
<i>Christelle Lukrich</i>	SOM/Human Resources Group
<i>Sally Mackey</i>	Medicine/SPRC
<i>Dennis Mitchell</i>	Microbiology & Immunology/Baxter Labs
<i>Christa Parrish</i>	Pediatrics
<i>Elizabeth Peairs</i>	SOM/Grad Student Support
<i>Bruce Seidel</i>	SOM/IRT Operations
<i>Jacqueline Signor</i>	ObGyn
<i>Susan Singh</i>	Radiology
<i>Maurice Tan</i>	Pathology/Blood Center
<i>Martha Trujillo</i>	SOM/Student Affairs
<i>Thanh Vu</i>	Medicine/Endocrinology
<i>Alayne West</i>	Genetics
<i>Mo-Oi Chang Yee</i>	SOM/General Clinical Rsch Cntr

25 YEAR EMPLOYEES

<i>Bethany Ball</i>	Pediatrics
<i>Catharine Booth</i>	Molecular and Cellular Physiology
<i>Katherine Dochez</i>	Medical Development
<i>Kathleen Dugan</i>	Medicine/Hematology
<i>Michelle Ferrari</i>	Urology
<i>Julian Hinojoza</i>	Pathology
<i>Gina Jager</i>	Microbiology & Immunology/Baxter Labs
<i>Jean Jang</i>	Pathology
<i>Susan Johnson</i>	Medicine/Nephrology
<i>Robyn Kizer</i>	Medicine/Immunology & Rheumatology

Phyllis Knudsen
Anna Korossy-Eredia
Linda Lew
Jeannie Lukas
Elizabeth McCormick
Carmencita Nicolas
Sharon Seliga
Richard Smith

Neurobiology
 Medicine/Gastroenterology & Hepatology
 Pediatrics
 Structural Biology
 Medicine/Oncology
 Pathology
 SOM/IRT Operations
 SOM/Research Mgmt Group

30 YEAR EMPLOYEES

Marcia Bieber
Beverly Bonfert
Yvonne Cheng
Mary Jane Eaton
Pamela Petrie
Robert Marshall
Maureen Rittenberg
Gerald Weitz

ObGyn
 Cardiothoracic Surgery
 Biochemistry
 Pathology
 SOM/IRT Operations
 Neurobiology
 SOM/SA Dean of Research Oper
 SOM/IRT Operations

35 YEAR EMPLOYEE

Tom Nozaki
Lilia Gabisan

Genetics
 Medicine/Oncology

40 YEAR EMPLOYEE

John Dolph
Tom Rojas

Surgery/Anatomy
 Comparative Medicine/Vet Service Ctr

45 YEAR EMPLOYEE

Ramon Nazario

Comparative Medicine/Vet Service Ctr

DFA Retreat Focuses on Community Service

During the last week of October, Mike Hindery, Senior Associate Dean for Finance and Administration brought together the Departments' Directors of Finance and Administration and senior managers in the Dean's Office for their seventh annual retreat. However, instead of doing strategic planning or staff development, or listening to a motivational speaker, they banded together to perform community service for three local organizations. The 2004 annual retreat was designated as "***Team-Building through Community Service***" and included partial day sessions with the Haven Family House, the Ronald McDonald House and the Second Harvest Food Bank.

- At ***Haven Family House***, which provides temporary family housing and day care services to families who need help getting back on their feet, the group worked on

raised vegetable beds that formed a beautiful garden and will help feed the families housed there.

- At ***Ronald McDonald House***, which provides “home-away-from-home” facilities for families with children receiving care at LPCH, they put up Halloween decorations for the children.
- At ***Second Harvest Food Bank*** they processed 1000 donation cans that will enable the organization to collect money to fund their provision of meals to low-income children, adults and seniors.

Each of these organizations provides valuable services to the community and the School is thrilled to be associated with them. This “retreat” gave our senior managers and organization an opportunity to help others and give back to the community that we are serving and do some team building along the way. I’m told that the group accomplished a great deal but also thoroughly enjoyed themselves.

Update From the Executive Committee: The School of Medicine Office of Communications and Public Affairs

At the November 5th Executive Committee meeting, Paul Costello, Executive Director of the Office of Communications and Public Affairs, provided an overview of the work of his group. The Office covers print and web communications as well as media relations. In the area of print and web communications, the Office publishes 38 issues annually of the *Medical Center Report*, which is an insert of the weekly *Stanford Report* newspaper. The beat reporters/writers cover research and medical breakthroughs. In addition, the Office publishes the magazine *Stanford Medicine* three times a year. They also post content on the School of Medicine home page and throughout the web site. The Communications and Public Affairs web site received 39,000 hits in August and 49,550 in September.

In the area of media relations, the Office pitches stories to the media, handles press inquiries, advises faculty on handling the press, and focuses on two areas: print and broadcast. During the past nine months, the Office has issued 85 press releases of studies, research, and personnel announcements, handled 1,100 print media calls, 500 broadcast media inquiries, and has had 2,600 media hits. It has also conducted three media training sessions and has two more scheduled. Paul explained that the strategic goals of the Office of Communications and Public Affairs are: to support the mission of the School of Medicine, to support the fund-raising goals of the School of Medicine, to promote the scientific and medical innovations that occur in the School, and to promote thought leadership on the part of members of the Stanford community.

I would only add that I am, of course, very pleased that our Office of Communications and Public Affairs is both highly responsive and strategically proactive. It is well aligned with the goals of the School and is making major contributions to our progress in many areas. Thanks to Paul and all of the members of his staff for their many efforts.

Katherine D. McCormick Distinguished Lecture

The Faculty Selection Committee for the Katherine D. McCormick Distinguished Lecture Series, has informed me that this year's McCormick Lecture will be given by Dr. Huda Zoghbi, Howard Hughes Investigator and Professor in the Departments of Pediatrics, Neuroscience and Molecular and Human Genetics at Baylor College of Medicine. Dr. Zoghbi will speak on Tuesday, November 30 at 4:30 pm, on "Breaking Down the Pathogenesis of a Neurodegenerative Disease Using Cross-Species Studies" in Fairchild Auditorium. The lecture is free and open to the public, and a reception with refreshments will follow the lecture.

The members of the Katherine D. McCormick Distinguished Lecture Selection Committee are: Erick Knudson, Professor of Neurobiology, Alfred Lane, Professor of Dermatology, Robert Malenka, Professor of Psychiatry and Behavioral Sciences, Marlene Rabinovich, Professor of Pediatrics, Lucy Shapiro, Professor of Developmental Biology, and Judy Swain, Chair and Professor, Department of Medicine.

Awards and Honors

- **Dr. Saul Rosenberg** Maureen Lyles D'Ambrogio Professor in the School of Medicine, Emeritus received the first Rosetta Medical Award of the Lymphoma Research Foundation. The presentation was made at a gala event in San Francisco on October 28.
- **Karl Deisseroth**, Assistant Professor of Bioengineering and Psychiatry, has been named one of three academic physicians in the United States to receive a prestigious Charles E. Culpeper Scholarship in Medical Science, a program designed to support the career development of academic physicians. Congratulations to Karl!
- **Dr. Tom Krummel**, Emile Holman Professor and Chair of the Department of Surgery at SUMC and Susan B. Ford Surgeon-in-Chief at LPCH, has been elected a Director of the prestigious James IV Association of Surgeons. Congratulations to Dr. Krummel.

Appointments and Promotions

- **Paul Buckmaster** has been promoted to Associate Professor of Comparative Medicine and of Neurology and Neurological Sciences, effective 11/1/2004.
- **Linda Boxer** has been promoted to Professor of Medicine (Hematology), effective 11/1/2004.
- **Steven Coutre** has been promoted to Associate Professor of Medicine (Hematology) at the Stanford University Medical Center, effective 11/1/2004.
- **Steven Foug** has been promoted to Professor of Pathology, effective 12/1/2004.
- **Ware Kuschner** has been promoted to Associate Professor of Medicine (Pulmonary and Critical Care Medicine) at the Veterans Affairs, Palo Alto Health Care System, effective 11/1/2004.

- ***Ann Leung*** has been promoted to Professor of Radiology at the Stanford University Medical Center, effective 11/1/2004.
- ***James Quinn*** has been appointed to Associate Professor of Surgery (Emergency Medicine) at the Stanford University Medical Center, effective 11/1/2004.
- ***Randall Stafford*** has been promoted to Associate Professor of Medicine, effective 12/1/2004.
- ***Susan Swetter*** has been promoted to Associate Professor of Dermatology at the Veterans Affairs Palo Alto Health Care System, effective 11/1/2004.

Dean's Newsletter

November 29, 2004

The Holiday Season

Some things are still incomprehensible to me. As I write this edition of the Newsletter while peering out my office window at clear blue skies that are without a hint of snow, it seems implausible that Thanksgiving has just passed and the Hanukah, Christmas and the New Year are just around the corner. It is hard to think of the winter holiday season without reference to one's childhood memories (or, in my case, decades of an adult East Coast existence). For me, this season is associated with the coming of plummeting temperatures and rising drifts of snow. The fact that the dry brown earth around Stanford is springing forth new green tufts of grass evokes a different sense of the pending winter season! But regardless of the variations in the outside view, the inner peace of the Holiday Season is constant. I hope the Season will be a happy and joyous one for each of you.

The Frustrations of Our Current Health Care "System"

Over the last few weeks Stanford employees have selected their benefits, including health care coverage, for the 2005 year. With over 42 million Americans uninsured and many others only minimally covered by health insurance, this annual rite evokes a number of reactions. It is ironic that just weeks ago during the Presidential debates much was said about the state of America's health care system – including many accolades about how we have the best health care system in the world. I wish that were true.

Certainly we have a highly technologically advanced health care system in the USA, and it is true that those with financial resources can access the very best health care perhaps anywhere. But this is not a universal or perhaps even an average story. Indeed I would argue that we really don't have a health care system at all in the United States. What we call a "health care system" is in many ways an incidental by-product of wage control during the Second World War that resulted in health care coverage as an employee benefit. This employer-based system, with all of its imperfections, still defines America's health care system. It has been made significantly worse by the ill-founded notion that health care (and its costs) can be controlled by market forces as if it were a commodity.

While it is true that market forces during the mid-1990s did transiently hold down rising health care costs, they also created a health care industry that has, to a large extent, both lost its way and fractured the public trust in medicine as a profession.

The last years have witnessed a system that, rather than asking what is best for the patient, largely creates competition around price. The ever-growing health care behemoths, rather than asking how to assure that an individual receives the best care, seek to control “market share”, thus setting up a constant struggle between payers, providers and patients (now mostly referred to as “consumers”). Despite this competition around price, health care costs continue to soar and now represent over 15% of the GDP (more than any other nation) with no absolute population based benefits. Infant mortality remains below the top tier and longevity is better in many other countries. Of course we argue that we do not suffer a “socialized” system of health care, nor do we have rationing or restriction of services – or so it seems at the surface.

I expect that many of you felt challenged as you reviewed the various health care plans and options to select from in early November. While much appreciation must be given to Stanford Human Resources and University Leadership for working hard to make affordable options available to Stanford faculty, staff and students, the choices were often confusing and, especially for those with existing health issues, quite challenging. In many ways these offerings are part of a patchwork that merely applies a band-aid to a system that truly needs much more fundamental change. While the buzzword of the day is greater consumer participation (which I do believe is good), this is, in many ways, an effort to shift costs and burdens to the consumer while still sustaining (or is it protecting) the current dysfunctional system.

Efforts to develop a more rational health care system have certainly been pursued, although they have been largely foiled during the last several decades. They date back to efforts of Presidents Truman, Nixon and, perhaps most notably and recently, Clinton. Each failed due to the lobbying of special interests, including the insurance industry, the pharmaceutical industry and physicians. The lack of ability to resolve the current health care crisis, fueled of course by market forces, results in the current non-system. Sadly, I am not optimistic that there is yet the resolve in the nation to address the fundamental problems underlying American health care. Although I fully recognize that defining a system that will have broad appeal is Pollyannaish, it is time for communities and states to explore new pathways. Oregon has done that over the past decade with some success. Other novel approaches are needed. While I recognize the limitations, I think that a move toward a single payer system makes considerable sense at this time. There are many caveats – but given our current system, the benefits surely seem to have merit.

We stand at a remarkable crossroad. We are the beneficiaries of an extraordinary legacy of scientific discovery that has changed, and will continue to change, our approach to the diagnosis, treatment and prevention of human disease. The same country and economy that spawned and supported this scientific revolution have also been the custodian, perhaps inadvertently, of a health delivery system that appears to be fracturing and that, at a minimum, is creating classes of health care that stratify along lines of personal

wealth. As a nation we can and should do better. I hope that we at Stanford can contribute to this debate and to efforts to promote a successful transformation in our health care system.

Wishing Well to Dr. Judy Swain

On November 18th, Dr. Judy Swain, the Arthur L Bloomfield and the George E. Becker Professor of Medicine and Chair of the Department of Medicine, announced her decision to become the First Director of the College of Integrated Life Sciences at the University of California, San Diego. This new opportunity will permit Dr. Swain, who has led the Department of Medicine as its chair for 8 years, to continue to foster the training and development of physician-scientists, an area that has been an important centerpiece of her distinguished career. I want to thank Dr. Swain for her many contributions and to wish the very best of continued success in her new position at her alma mater UCSD.

Special Thanks to Sharon Olsen

I also want to publicly thank Ms. Sharon Olsen, who served as my Executive Associate until November 19th when she returned to Boston to serve as the Executive Assistant to the President of the Dana Farber Cancer Institute. I had the privilege of working with Ms. Olsen in Boston and at Stanford. While at Stanford she did an exceptional job in serving the Office of the Dean and the School of Medicine, and I want to thank her tremendously for those efforts. We wish her and her family well.

School of Medicine Budget Results for FY2004 and Forecast for FY2005

The challenges related to the conversion of the University financial systems during the past year have posed particular difficulties to our financial management, including our ability to obtain accurate and timely end of the year data. But as of November 19th, the data were complete enough to permit Mike Hindery, Senior Associate Dean for Finance and Administration, to review the FY04 budget actual performance and FY05 budget with our Executive Committee. I want to share some of the high level results with you.

As you know, most of our School-wide investments are driven by our Strategic Plan *Translating Discoveries* (<http://medstrategicplan.stanford.edu/>), which serves as a guide to our immediate future. This plan addresses our goals and objectives in education, research, patient care, community service, advocacy and public relations, etc. For FY04 (the year which closed on August 31st, 2004), we had projected a \$38M deficit (or use of reserves) in order to fund important initiatives. It turned out that at the close of the year, we finished the year with a consolidated surplus of \$7M. This was largely the result of revenues that could not be anticipated at the beginning of FY04, especially patent and royalty income, endowment performance, gifts, and patient care activities. While this is encouraging, it is difficult to extrapolate these positive revenue sources to future years and, in fact, our budget for FY05 (the year that began on Sept 1 2004 and which ends on

August 31 2005) includes a \$20M deficit. Again this is based on major strategic initiatives that include the following:

FY2005 Budget Strategic Initiatives

<i>Stanford Institutes of Medicine and other Interdisciplinary Efforts (e.g., cancer center) and interim facilities development</i>	\$11,694,000
<i>Education: Learning Center, Community Service, Programmatic Initiatives</i>	\$3, 677,000
<i>Information Resources and Technology</i>	\$1,000,000
<i>Recruitments (chairs and faculty)</i>	\$11,792,000
<i>Essential Clinical Services Fund</i>	\$861,000
<i>Interschool Initiatives (Clark Center Operations, BioX, Bioengineering</i>	\$4,343,000
<i>Operating Budget Transitions (based on smoothing of transition from FY04)</i>	\$2,285,000
<i>Miscellaneous (Support for Clinical Research, Diversity, Medical Development)</i>	\$2,872,000
Total Strategic Initiatives	\$38,524,000

These strategic investments are a vital component of our consolidated FY05 budget of \$816 million for the School (exclusive of the affiliated hospitals).

Overall the School remains financially healthy with an endowment balance (as of August 31, 2004) of \$1.404 B and consolidated expendable fund reserves of \$360,341,000. While this is encouraging, it is important to note that the majority of these endowment and expendable funds are in restricted pools and most reside in the departments. Thus their availability for new school-wide initiatives is limited.

Also, we face a number of challenges going forward,. One is the likelihood that our revenues from patent and royalty income will decline (although this is always unpredictable), that NIH funding will be more limited (the most recent news on the FY05 NIH budget is that it will rise by only 2.1%), and that costs will continue to increase , especially for programmatic and capital needs. Further, we are facing a number of key department chair recruitments (e.g., Cardiothoracic Surgery and Neurology and Neurological Sciences are moving to chair selection, the Obstetrics and Gynecology search is just getting underway and new searches are now planned for Medicine and Pediatrics that will commence at the beginning of the year).

The major reason we spent so much time developing our strategic plan was to allow us to guide our future purposefully and with explicit and shared goals. –The strategic plan continues to provide the foundation for our budget decision making process, so that now and in the years ahead we can assure that the Stanford School of Medicine is sustained and enhanced as one of our nation’s premier medical schools.

Launching the School of Medicine Initiative on Immersive and Simulation-Based Learning

In my last Newsletter (<http://deansnewsletter.stanford.edu/>) I provided information about a set of activities planned for the November 15th launch of the School's initiative on Immersive and Simulation-based Learning. Dr. David Gaba, Professor of Anesthesia and recently named Associate Dean for Immersive and Simulation-Based Learning, reported back that the morning activities drew a crowd of over 150 guests. They included Stanford faculty and students, alumni, interested friends of the school, industry partners, and academic partners from around the country and colleagues from our teaching hospitals. Key speakers included Dr. Gaba, the Directors of our founding simulation centers, and Ajit Sachdeva, MD, Director, Division of Education, American College of Surgeons. One highlight was an impassioned presentation from Dr. Amitai Ziv, MD, Director, Israel National Simulation Center, Chaim Sheba Medical Center, who presented examples of the comprehensive immersive learning and simulation center that he and others have created for the unique demands in Israel. Archived streaming video of the presentations can be viewed on the Web at:

http://med.stanford.edu/irt/immersive/launch_video/

The morning session was followed by a lunch panel discussion attended by approximately 85 Stanford faculty, visiting academic and hospital colleagues. The panel included Jeff Driver, JD/MBA, Director of Risk Management for both SUH and LPCH, Julie Parsonnet MD, Senior Associate Dean for Medical Education, Kelley Skeff, MD, PhD, Internal Medicine Residency Director and Director of the SFDC, Geoff Lighthall, MD, Assistant Professor of Anesthesia & Intensive Care, who is a developer of simulation courses in critical care, and Dr. Ziv. The questions and discussions focused on the practical issues of appropriate and effective application of ISL techniques, simulation training as a tool for risk management and reduction of medical error, simulation as a tool for assessment of clinical trainees and practitioners, and pathways for providing resources and faculty development to underpin new initiatives in ISL.

An additional note – on the Sunday prior to the public launch activities, the School of Medicine and the Office of Government Affairs hosted the second discussion of the AIMS group (Advanced Initiatives in Medical Simulation). This group is focused on developing a national agenda around the development of medical simulation techniques for a variety of health care applications in education, training, performance assessment, and research. AIMS intends to raise the visibility of simulation in the federal government with the hope of stimulating greater funding for research, pilot projects, and the support of students and post-doctoral fellows in this arena. The meeting was highly successful, and Stanford will continue to play an important role in the AIMS process.

More About HIPPA and Data Security – What's Coming in 2005!

At the November 19th Executive Committee meeting, Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, and Dr. Todd Ferris, Director of

Privacy and Data Security, provided an update on the status of the School's activities in the area of data security. By way of context, Dr. Ferris pointed out that the Health Insurance Portability and Accountability Act of 1996 (HIPAA) imposed significant security regulations. Indeed we are required to be in compliance with these regulations by April 21st, 2005. In addition, there are numerous other new regulations that cover protected information, which includes, in addition to patient medical information, research subject information, Social Security numbers, student records, and banking information, and Stanford intellectual property.

Historically, however, academic institutions have not focused on computer security. Now, computers and the use of the Internet have become almost required to operate academic institutions. In addition to the laws requiring data security, there has been an almost exponential increase in viruses, worms, and malicious hacking that the School must combat. In order to deal with these changes, the School must make a transition from a previously open academic computing model to a secure computing model. The challenge is to create a flexible secure computing model that accommodates the needs of faculty, staff, and students. However, we will also have to change some of our day- to- day behavior. And we must do this!

In order to be compliant with the new regulations, the School must implement 18 standards, 42 implementation specifications and 10 policies, which themselves contain 6 guidelines. For example, in the administrative area, the School must have documented policies and procedures for day- to- day operations, managing the conduct of employees with electronic patient health information, and managing the selection, development, and use of security controls. Physically, we must have in place security measures meant to protect our electronic information systems, as well as related buildings and equipment, from natural hazards, environmental hazards, and unauthorized intrusion. Furthermore, we must ensure the compliance of our workforce. For desktops, laptops, servers, and PDAs, all devices that may hold protected information need to conform to the computing device policy and guidelines. This includes: anti-virus, patch management, disabling unused devices, and strong passwords. Devices that are mobile must encrypt any protected information stored on the device.

In fact, within the School of Medicine there are approximately 200 "information systems." Each will have a formal risk assessment and a remediation plan developed. Currently the systems in the IRT data center are being reviewed. Soon departmental systems will be reviewed. Training modules are being developed to assist in implementing the new policies and guidelines. These are projected to be ready for use by early December. In addition, IRT is launching a central help desk in January that will help coordinate activities of local support personnel. IRT will also provide training for local support people on securing systems. In addition, IRT is adding firewalls, intrusion detection, and is more aggressively monitoring for malicious activities to the School's network.

This is obviously a huge effort and is one that will require understanding and flexibility on all our parts. Drs. Lowe and Ferris and their colleagues in IRT have made enormous

progress in moving the School to full compliance with the new regulations. We will keep you informed of further developments.

Work-Life Balance: The WorkLife Office at Stanford University

At a recent Dean's Staff meeting, Ms. Teresa Rasco, Director of the WorkLife Office at Stanford University, presented an overview of the many programs and services her Office provides. The mission of the WorkLife Office is to support "the University's academic mission through direct services and by developing collaborative partnerships within Stanford and the surrounding community to assist faculty, staff, and students in navigating the competing demands of their work, study, personal and family lives." A large component of the Office's programming consists of resources and services for and about children, including on-site children's programs (day care, pre-school, and after school), back-up child care, parent education programs, the Child Care Subsidy Grant Program, and the Adoption Reimbursement Program. At the other end of the continuum, the Office provides educational programs and referral resources for elder care and caregiver services and has a link to Avenidas, which provides individual and family services to seniors throughout the Mid-Peninsula area.

In the Dean's Staff discussion it was noted, in our fast-paced academic culture, trade-offs between work and family can be difficult to negotiate. I want to make it clear that, in my view, family issues should take a priority wherever feasible. Supervisors need to be sensitive to these issues and work with their staffs to allow them, as much as possible, to attend to family obligations, such as illness of a child, without facing, or worrying that they will face, negative consequences at work.

We also noted that members of the Stanford community might not be aware of the many resources available through the WorkLife Office. In my view, the work of this Office is critically important to the success of the School and the University, and I encourage everyone to take advantage of its services. The web site for the Office is <http://worklife.stanford.edu>.

Awards and Honors

- **Dr. Arthur Kornberg**, Emma Pfeiffer Merner Professor of Biochemistry, Emeritus, has received the Osaka Sakura Award and has been also named an honorary member (one of only 20) of The Japan Academy. Congratulations to Dr. Kornberg for his continuing accolades to a remarkable career in medicine and science.
- **Dr. Gerry Reaven**, Professor of Medicine Emeritus, has been awarded the Ellen Browning Scripps Medal for 2004, which recognizes an individual who has made a significant contribution to the care of patients and the advancement of medical science. In addition, Dr. Reaven also recently received the Astute Clinicians Award from the NIH that acknowledges a clinical scientist who has conducted

research that has had a big impact on medicine. Congratulations to Dr. Reaven for these two very special awards.

Appointments and Promotions

- **Howard Chang** has been appointed as Assistant Professor of Dermatology, effective 12/1/2004.
- **Tobias Meyer** has been promoted to Professor of Molecular Pharmacology, effective 12/01/2004.

Dean's Newsletter December 13, 2004

Some Brief Reflections at the Conclusion of 2004

While a more complete accounting of this past year's performance and plans for 2005 will be offered in the January 10 2005 Newsletter, I thought I would offer a few high level reflections in this last Dean's Newsletter of 2004. When framed against the larger challenges that dominate our attention – the war in Iraq, tides of terrorism, the fragile economy, the rise of fundamentalism and theocracy, along with so many other important issues – the concerns we face at Stanford can sometimes seem small by comparison. And yet we are undertaking some truly important issues that have national and global impact.

Recently, I offered some comments on the deficiencies of our health care system (see November 27th issue of the Dean's Newsletter <http://deansnewsletter.stanford.edu/>), many of which continue to erode the public trust in medicine and its aligned disciplines. The recent debacle surrounding the availability of the flu vaccine, which revealed how tenuous our supply line for vaccines can be, along with the increasing fears about the possibility of an influenza pandemic surely have an impact on the public trust in medicine and the pharmaceutical industry. So too do the revelations regarding disclosures of potential health hazards related to drugs the public counts on (e.g., Cox-2 inhibitors like Vioxx). The rising price of drugs, a major driver of health care costs, further challenges the public's confidence in insurers, doctors and health care providers, as well as in the pharmaceutical industry and its regulatory oversight by the FDA.

Paradoxically, these public concerns arise at a time of remarkable scientific promise and opportunity. Yet, worries abound here as well. For many years the NIH, our nation's largest funder of biomedical research, has enjoyed a high level of bi-partisan respect and confidence, especially by the Congress. This featured prominently in the extraordinary efforts to double the NIH budget in 5 years, which was accomplished but which also ended in 2004. Fiscal constraints in discretionary spending, coupled with last year's conflict of interest scandals, which significantly tarnished the image of the NIH, likely

contributed to an FY05 budget increase of only 2.1%. While this is certainly higher than nearly all other federal agencies, it will not sustain the prior strength of the NIH budget. In particular, it will reduce the amount of support available for new and competing RO1 grants, which are, in many ways, the true heart and soul of our biomedical research enterprise. The potentially devastating impact of this reduction on new young faculty has extremely important implications that could, if unchecked, stifle the development of the next generation of bioscience investigators.

These issues are hardly trivial and, even when balanced against serious global matters, propel us to act assertively and with as much care, precision and advocacy as we can. They provide yet another reason why our prior strategic planning efforts at Stanford School of Medicine loom so importantly as we seek to define our future against a backdrop of potentially declining resources. Our efforts to educate the next generation of physicians who are also scholars and leaders may prove essential in filling a potential national void as well as in seizing important opportunities for discovery and progress. These will surely be aided by the important curriculum revisions that have come on line during the past 18 months. Our commitment to training our graduate students in interdisciplinary ventures as well as in offering opportunities to connect basic research to patient care by “*Translating Discoveries*” will almost surely be increasingly important as the pipeline of young investigators becomes more difficult to sustain. Stanford’s role will surely be important in this vital area and I believe we will be successful.

Assuring connections between basic and clinical research will also be essential as the NIH Roadmap assumes an increasingly important place in the eyes of the Congress. Here our Stanford Institutes of Medicine and our new department of Bioengineering, as well as the entire BioX initiative, should permit us to assume leadership in key strategic areas. Proposition 71 and the new California Institute for Regenerative Medicine will certainly prime the pipeline of stem cell research. With our Stanford Institute of Cancer/Stem Cell Biology in place we should be well positioned to assume a leadership role here as well (see below for additional information). In addition, the interconnections of stem cell research among each of our four Institutes – which in addition to Cancer/Stem Cell Biology, include Neuroscience, Cardiovascular and Immunity/Transplant/Immunity – are notable and important.

Of course, bringing discovery to improvements in the health of adults and children must remain among our highest priorities. To do this, additional improvements in our clinical research infrastructure will be critically important. To this end, early next year we will launch SPCTRM (Stanford/Packard Clinical And Translational Research). This broad based infrastructure support organization for clinical and translational research will surely play an important enabling role for *Translating Discoveries* (see our Strategic Plan Website <http://medstrategicplan.stanford.edu/>). Further, we must accomplish these improvements in health in ways the public – our most important constituency – can recognize, understand and support. This need underscores the reason for embracing communication and advocacy as an important part of our strategic efforts, through our community events, mini-med schools, writing and communication.

As we end 2004 and begin 2005 I certainly see the obstacles that lie before us. But more importantly, I am confident that we have the opportunity to continue to do extraordinary work: to educate future leaders, conduct groundbreaking research, and initiate new innovations in patient care. Moreover, I continue to believe that we can pave new paths and open new vistas – making Stanford the role model it must be for the future.

Best wishes for the Holidays and, of course, for the New Year!

Stem Cell Research: Proposition 71, the California Institute on Regenerative Medicine and Stanford University

The next decade will offer significant opportunities to advance knowledge in stem cell biology and regenerative medicine, especially in California, thanks to the passage of Proposition 71 on November 2nd. During the next couple of months the research landscape will be more clearly delineated, since there is every expectation that Prop 71 (now known as the California Institute for Regenerative Medicine) will begin funding proposals as soon as the Spring of 2005. Obviously this will create an enormous pressure on the various oversight and review committees, which will need to be up and running in the next weeks to months. The Independent Citizens Oversight Committee (ICOC), which will oversee the whole effort, will hold its first meeting on Friday December 17th. As you likely know I was asked to serve on the ICOC by State Controller Steve Westly. While I recognize the importance of this effort, I am also cognizant of the enormous responsibility and accountability it will bring, both for me personally and for Stanford. I will give you periodic reports on the progress of the ICOC and the overall efforts of the California Institute for Regenerative Medicine.

At Stanford we have been putting into place an organizational structure to help bring together our own community of faculty interested in stem cell research. Our Stanford Institute for Cancer/Stem Cell Biology will oversee this effort. As part of this initiative, Dr. Irv Weissman, Director of CSCI, has appointed Dr. Linda Giudice, Stanley McCormick Memorial Professor, to chair a retreat focused on Stem Cell Research. This retreat, scheduled for January 15th, will bring the Stanford community together to share ideas and plan for the future. The specific goals are to identify all who are interested in regenerative medicine research at Stanford, to begin discussion, and to coordinate strategic planning regarding research programs, research collaborations, infrastructure, training opportunities, and organizational structure. In addition, we hope that the retreat will lead to planning for Stanford University proposals for Proposition 71 funds.

Per Dr. Giudice, “regenerative medicine research has extraordinary potential in basic research as well as translational medicine.” She and her colleagues have been in the planning phases of a Human Embryonic Stem Cell Center in the Stem Cell Institute. They hope to facilitate a broader effort to develop existing NIH cell lines, derive new cell lines, elucidate stem cell biology, stem cell renewal and differentiation, and develop new applications for treating chronic diseases. Dr. Giudice points out that “regenerative medicine research takes place in the context of ethical and legal guidelines, and it is

likely that new technologies will be developed for therapeutic applications. These are all important issues, and we hope to discuss their integration at the retreat.”

Further details will soon be available about the January 15th Retreat but I wanted to let you know about this event now so that you can mark it on your calendar. If you are interested, please contact Dr. Giudice for additional details (giudice@stanford.edu).

Addressing the Challenges Facing the NIH

At the December 3rd Executive Committee, Ryan Adesnik, Director of Federal Government Relations, provided an update on issues the NIH will face in the next Congress. The discussion focused on two topics: the current and projected level of NIH funding and the upcoming NIH Reauthorization Bill—which is basically a policy review of the agency.

These are challenging budgetary times for research funding and support as the federal government confronts the costs of the Iraq War, a growing deficit and the ongoing effort to fund tax cuts. Last week, in this budgetary environment, Congress passed an NIH budget that constituted a 2.2% increase over last year’s funding. Studies show that, because of the costs associated with biomedical research, annual increases of at least 6% are needed to keep grants at existing levels. Unfortunately as we look to the future, the President’s last budget through 2009 projects continuing declines in non-defense R&D including NIH, where the funding level in 2009 is projected to be 5% less than its 2005 level (in constant dollars). This is obviously very challenging news to biomedical research, and it has many implications for academic medical centers, including Stanford.

In addition to this difficult legislative environment, the NIH faces a number of important policy (and public perception) challenges, including: the communications dilemma of explaining the need for continued funding increases following the historic doubling, questions related to the recent conflict of interest inquiry that has plagued the NIH since this matter arose a year ago, and recent challenges to the peer review process.

This is the context in which the 109th Congress is planning to take up an NIH Reauthorization Bill. By way of background, a reauthorization bill is a policy review of a federal agency or program conducted through the legislative process. However it can result in a number of important financial impacts. Importantly, a reauthorization bill can be as broad or narrow as the committee of jurisdiction chooses. For example, the most recent NIH Reauthorization Bill was passed in 1993 and made significant changes, including:

- Establishment of the Office of Research Integrity at HHS
- Mandating the inclusion of women and minorities in clinical research trials
- Creation of the Office of Alternative Medicine, the Office of Research on Women’s Health, the Office of Research on Minority Health, the Office of Behavioral and Social Science Research, and the National Center for Human Genomic Research

In 1996 Congress attempted another NIH Reauthorization Bill. Although it passed the Senate it was not acted upon in the House. Nonetheless, many of its provisions later became law, including:

- Increased Parkinson's funding
- The Pediatric Research Initiative in the Office of the Director
- Increased funding for Type 1 diabetes
- Establishment of the Office of Rare Diseases

In response to the plans for a new NIH Reauthorization Bill, I have worked with the American Association of Medical Colleges (AAMC) to establish an NIH Reauthorization Task Force to develop ideas that will inform the process. I am co-chairing this Task Force along with Bob Kelch, Vice President for Medical Affairs and CEO of the University of Michigan Health System. This group's goal will be to work in a cooperative way with Capitol Hill in an effort to educate Members of Congress and their staff and to develop ideas that will benefit the research mission. Ryan Adesnik will staff this group and will also serve on an analogous committee of the American Association of Universities (AAU). Time permitting, we maybe calling on members of the School of Medicine community to assist in reviewing draft legislation, and possibly giving testimony at one of the numerous hearings that will no doubt occur.

In addition, your input is needed as we address critical questions. For instance, what structural or organizational changes, if any, would benefit the NIH and biomedical research? How can the NIH demonstrate accountability it is oversight (e.g. the peer review process) without having a negative impact on the research mission? How can the NIH better communicate its successes, especially given the increasing desire of the Congress to show results from the recent NIH doubling? What are some ideas for arguments to defend peer review?

Your ideas are welcome. Please direct them to Ryan Adesnik at radesnik@stanford.edu. Thanks to Ryan for a very helpful primer on this critically important topic. We will keep you apprised of further developments about this extremely important issue.

School of Medicine and Hospital Leaders Explore Model for Interactions at the University of Michigan

On December 7th, a joint School of Medicine-Stanford Hospital & Clinics team visited the leadership of the School of Medicine and Hospital at University of Michigan. The purpose of the visit was to compare approaches to crafting joint ventures or business relationships between the school, faculty and hospital. The University of Michigan has successfully launched an innovative program that supports their Cancer Center. Based on information I had gathered during an earlier visit to U Michigan, we felt we could learn from their experience and perhaps emulate aspects of it at Stanford. The methodology was published in an article entitled "New Organizational and Fund Flow Models for an

Academic Cancer Center” by David Spalinger (who coordinated our visit) in *Academic Medicine* 2004;79:623-627).

Our School-SHC Funds Flow Team comprised of Norm Rizk, Jerry Shefrin, Mike Hindery, Marcia Cohen, David Keane and Rob Jackler has been evaluating a number of methodologies to address funds flow and will now be exploring how the Michigan experience might apply. We anticipate having more updates about this topic in the early part of 2005.

Roundtable Discussion with the Governor

On Thursday December 9th I and other members of the Board of Directors of the California Healthcare Institute (CHI) met with Governor Schwarzenegger at the State Capitol Building in Sacramento. We had the opportunity to discuss a number of important issues with the Governor, including the importance of innovation in improving the health and well being of our communities. The consortium of academic institutions, biotech and related industries which comprises the CHI has played a major role in stimulating the discovery of new drugs and medical devices that have impacted the health of adults and children. In addition, academia-industry collaborations have also fueled the job market –over 230,000 Californians are working in the 2600 biomedical companies located in the state. Moreover, there are hundreds of thousands of Californians who are employed at state or private universities or research institutions and who also contribute significantly to innovation and discovery. As you know, Stanford has played a major role in these efforts. There is little question that the passage of Prop 71 will further stimulate the process of innovation and, as a result, stimulate the state economy as well. At the same time, we also spoke with the Governor about the important challenges of health care access, the uninsured and underinsured and the costs for care, including the cost of pharmaceuticals. I made the point of how broken our health care system is and emphasized that major efforts are necessary to address its underlying problems. This meeting was introductory. I am hopeful that it will lead to continued dialogue that will seek solutions as well as opportunities.

Introducing the New Executive Assistant to the Dean

I am very pleased to announce that Ms. Noel Beauchamp has accepted my offer to come to Stanford as my Executive Assistant. Noel replaces Sharon Olsen, with whom I had the pleasure of working for many years in Boston and at Stanford.

Noel comes to Stanford from a varied career in government and the private sector. Most recently she served as Executive Assistant to the Vice President for Research and Clinical Development at Avigen, Inc. Her previous positions have included Executive Assistant to a CEO and to a Senior Vice President for Scientific Affairs in other biotech companies. In addition, Noel spent a year as a volunteer in with the United Nations Volunteer Program, which she spent as a Civil Affairs Officer with the UN Interim Mission in Kosovo. There she was a team member of the first UN-led municipality and was involved in a wide range of administrative, coordination, reporting, program oversight, and public

relations activities. I am pleased that Noel will bring this wide range of experience and expertise to bear in working with me and others in the School and University.

Update on Administrative Restructuring

At the December 3rd Executive Committee meeting, Mike Hindery, Senior Associate Dean for Finance and Administration, provided an update on administrative restructuring in the School. Work in this area has been underway for well over a year. Earlier stages in the project included an assessment of the School's current structure and units and the development of principles to guide a revised administrative structure. A model for this revised administrative structure was introduced at the January 2004 Strategic Planning Retreat and was further discussed and evaluated by the Executive Committee. The purpose of this update was to describe the progress to date in the implementation of this model.

The fundamental reason for undertaking administrative restructuring was the fact that changes in the School's environment in recent years has significantly complicated delivery of the School's administrative functions. These changes include the breaking down of boundaries between disciplines and the corresponding rise in non-departmental program units, the development and implementation of new University-wide information systems, continued increases in regulatory compliance requirements, a constrained economic environment, and staff burnout.

Departments continue to be an organizing priority, but non-departmental units (NDUs) – such as our Stanford Institutes of Medicine or Strategic Centers - are recognized as the important administrative units they are increasingly becoming. This model allows for effective support of both, through such mechanisms as shared DFAs (Departmental Finance Administrators) and the clustering of some functions. An Administrative Steering Committee made up of DFAs and other members of the School's administrative staff has the responsibility of implementing the model. Key elements of the model are currently being implemented in pilot projects. They are:

- ***The clustering of the Human Resource functions of PeopleSoft and Kronos.***
The basic science departments created a cluster in 2002-03 covering data management and other HR services. Three clusters of clinical departments were formed in 2004. Currently 23 departments participate in clusters. The expected improvements from the new structure include greater data integrity in PeopleSoft and more expert and faster service.
- ***IT Support service clusters.*** Bob Burkhardt of our Information Resources and Technology Office is directing the development of a "hub and spoke" model for desktop support that is intended to allow departmental users to get problems resolved more quickly by enabling remote desktop service and to allow higher desk top performance standards. It is hoped that this new model will significantly improve turnaround time on desktop assistance, provide more cost

effective service, and lead to the development of consistent standards for desktop systems.

Mike Hindery concluded by noting several challenges, including the need to design funding models for implementing new administrative structures, finding space for clustered services, and managing organizational change issues. The next steps include the continuation of implementation projects, documentation and communication of lessons learned with each implementation, and the creation of methods and metrics for evaluating success on a regular basis.

This set of projects is obviously of great importance to the School. A great deal of progress has already been made, and I look forward to seeing more positive change in the months ahead.

In Memoriam

- The Stanford community lost one of its most revered and respected colleagues when Professor Emeritus Byron “Bill” Brown died unexpectedly (see December 8th Stanford Report <http://news-service.stanford.edu/news/2004/december8/med-brown-1208.html>). His personal and professional contributions and collegiality are legion and he will be missed by generations of Stanford faculty, students and staff. A memorial service is planned for a later date and I will do my best to let you know when that is planned. The family suggests contributions to the Nature Conservancy in Professor Bill Brown’s memory.
- I am also very sorry to report that Steve Aldrich, the son of Rick and Mary Aldrich died in late November. His loss is deeply felt. Our condolences to Dr. Aldrich, Professor of Molecular and Cellular Physiology and his family for this tragic loss. The family has indicated that contributions can be made to the National Alliance for the Mentally Ill, 1111 Howe Avenue, Suite 475, Sacramento CA 95825.

Dean’s Newsletter January 10, 2005

State of the School 2005

In January 2001 I began a series of visits to Stanford in anticipation of assuming my decanal responsibilities that April. The discussions I had with faculty, students and staff during that interval, along with my own reflections, helped shape the underpinning for the School’s Strategic Plan, which was later designated as *Translating Discoveries*.

Indeed, in my first Dean’s Newsletter

(http://deansnewsletter.stanford.edu/archive/04_02_01.html), circulated on April 2, 2001, my first official day at Stanford, I reviewed some of my preliminary ideas, a number of

which have been actualized through the wonderful engagement and participation of the Stanford Medicine and University community.

As we begin 2005 a number of exciting programs have been initiated while others are preparing to unfold. Naturally these programs are constantly evolving as we strive to continue to develop and enhance the excellence of Stanford Medicine. So it is best to view even this summary of the “2005 State of the School” as a snapshot of some cameo highlights rather than a complete description of the School’s programs and initiatives..

Education

Thanks to the efforts of Dr. Julie Parsonnet, Senior Associate Dean for Medical Education and her colleagues in the Dean’s Office and Medical Faculty Senate, progress on the New Stanford Curriculum is continuing. As you know, the first major changes were made in the Fall of 2003. They were guided by the desire to better align learning in basic and clinical science and medicine, to create time for scholarly research, and to prepare students for lifetime learning. One of the most important changes is that medical students entering since September 2003 have been required to select a Scholarly Concentration from one of ten possibilities (http://med.stanford.edu/md/curriculum/scholarly_concentrations/index.html). The objective is to immerse them in an area in which they have an interest and through which they can acquire critical thinking skills and analytic research experience. Because research is such an important facet of Stanford, we believe that the New Curriculum better aligns medical students to our faculty and mission and that it will, by its very nature, permits us to select students who are truly interested and committed to what we can offer as a research-intensive school of medicine.

While these programs offer exciting new possibilities, they also result in clear differences between the new and old curricula. Indeed those students who are not part of the “New Curriculum” might easily feel somewhat disenfranchised – which we certainly hope is not the case. Generations of students have benefited from the prior curricula and we are confident that our more senior students will do the same! At the same time, we do believe that the many changes in the New Curriculum will better enable us to train future students to be excellent clinicians and leaders in an area of medicine or bioscience.

Over the next year we will continue the redesign of clinical rotations. In tandem we are putting in place tools and processes to evaluate the efficacy of the New Curriculum and to translate those findings into additional curricular improvements over time. These will include new technology tools to be developed by our recently established Center for Immersive and Simulation-based Learning.

We are also continuing to seek ways to establish appropriate alignments between medical and graduate students. These are particularly important at Stanford because of the strength and excellence of our graduate programs as well as the fact that we have a nearly comparable number of medical and graduate students. The composition of our student body is quite different from other medical schools but is quite compatible with our position as a research –intensive school of medicine. We are also developing courses and

programs that will enable graduate students to learn more about the challenges and opportunities in translational medicine, and we are anticipating the development of a Masters Program to facilitate these educational opportunities. In addition, we are pursuing efforts to create more interdisciplinary programs. We hope the University-wide Commission on Graduate Education (http://deansnewsletter.stanford.edu/archive/10_04_04.html#4) discussed in the October 4th Deans Newsletter will further these efforts. A question for the future is whether graduate programs in the School of Medicine should become more discipline based as compared to departmentally anchored.

Numerically our Postdoctoral Fellowship programs eclipse both our MD and PhD graduate programs. They serve as a critical interface between the laboratory and clinic as well as a key facet of our research engine. During the past year we have been exploring ways of making our postgraduate programs even stronger and will be introducing a program that will enable selected clinical postdoctoral fellows to pursue concomitant graduate studies if they are committed to a career in research. See http://deansnewsletter.stanford.edu/archive/09_20_04.html#4.

This past year we also launched the self-study phase of our review by the Liaison Committee on Medical Education (LCME), which will formally review the School in October 2005. This is an important review and significant efforts are underway to assure that we truly shine in our written and oral presentations. See also http://deansnewsletter.stanford.edu/archive/09_20_04.html#3.

Research

What distinguishes Stanford from nearly all of its peers is the extraordinary quality and impact of the research performed by faculty, students, postdocs and staff. By nearly any standard, Stanford scientists continue to contribute to a broad array of new discoveries, innovations and insights. Basic undirected research serves as the fundamental underpinning of this excellence and ultimately fuels the ideas that drive opportunities for translating knowledge from the laboratory to the bedside. While we are a small faculty compared to peer schools, the impact of our work is considerable and cannot be reduced to a short summary or even a readable listing. While some highlights appear on our current Stanford Website (<http://med.stanford.edu/spotlight/index.html>) these stories are just a sampling. The recently posted “Community Academic Profiles” of our faculty (<http://med.stanford.edu/research/cap.html>) offer an opportunity to explore the breadth and depth of ongoing faculty research efforts.

Complementing our efforts in basic research are those focusing on clinical and translational investigation. To help facilitate the integration of our research activities we have established our four Stanford Institutes of Medicine. More recently, we have been developing three “strategic centers” that will also help integrate our overall research mission (see http://deansnewsletter.stanford.edu/archive/10_04_04.html.) The Institutes of Medicine are:

1. ***Stanford Institute for Cancer/Stem Cell Biology and Medicine: Dr. Irv Weissman, Director***
2. ***Stanford Cardiovascular Institute: Dr. Bobby Robbins, Director***
3. ***Neuroscience Institute at Stanford: Dr. Bill Mobley, Director***
4. ***Stanford Institute for Immunity, Transplantation and Infection: Dr. Mark Davis, Director***

The Strategic Centers are:

1. ***Center for Clinical Informatics: Dr. Henry Lowe, Director***
2. ***Center for Genomics and Human Genetics: Dr. Rick Myers, Director***
3. ***Center for Imaging: Dr. Gary Glazer, Director***

Together the Institutes and Centers provide an umbrella that engages the interests of nearly all our faculty. They create a virtual bridge between our basic and clinical science communities and between the School and other sectors of the University. They open new venues for research and, importantly, for opportunities to extend findings to patients at our major affiliated hospitals.

Each of our four Stanford Institutes of Medicine is taking shape, both in their own unique ways and in relation to each other. I am confident that considerable additional progress will be made in 2005 to further establish their goals, objectives and early accomplishments. In this regard, the Cardiovascular Institute, under the leadership of Dr. Bobby Robbins and the Institute's Executive Committee, held a retreat on Friday evening January 7th and Saturday morning January 8th. I had the pleasure of attending the Friday night session and witnessing personally that more than 100 members of the Stanford community had demonstrated their interest in participating in one or more work groups that will address important challenges and questions. This work will surely lead to important new initiatives and opportunities for research, education and patient care. Similarly, the Cancer/Stem Cell Institute is planning a retreat for Monday January 31st that will further organize Stanford's role in stem cell research and our relationship to the new California Institute of Regenerative Medicine (and Proposition 71). I know that the Neurosciences Institute and the Immunity, Transplant and Immunology Institutes are also actively planning their future agendas.

During the past year we have made further progress in our march toward applying to become a National Cancer Institute-Designated Comprehensive Cancer Center. Thanks to the efforts of Dr Karl Blume we have been able to configure the nine core research programs and 13cores (a.k.a. "shared services") that we anticipate will be parts of the grant application we hope to submit later this year. In the Fall I appointed Dr. Irv Weissman to serve as the Principal Investigator for our planned Center. We are close to completing the recruitment of a superb Deputy Director, who will work closely with Dr. Weissman as well as Dr. Steve Leibel, Medical Director for the Clinical Cancer, and Dr. Blume to bring the grant proposal to fruition. We benefited from the advice of our External Advisory Board, which met with us in March 2004 (http://deansnewsletter.stanford.edu/archive/03_22_04.html) , and we plan another

critical review by this Board in the late Spring or early Summer of 2005. We have also been fortunate in forging a collaboration with the Northern California Cancer Center (NCCC) that was formalized at the end of 2004 with an Affiliation Agreement. This Agreement, plus the faculty appointment of Dr. Dee West, Professor of Health Research and Policy, and Chief Scientific Officer for the NCCC, will provide the collaborative expertise that will permit the population studies component of our proposal to be robust and exciting. Although we have considerable work to do, we have made terrific progress and there is reason for optimism that Stanford may finally actually apply (and, hopefully, succeed) in achieving NCI-designation as a Comprehensive Cancer Center.

The joint Bioengineering Department between the Schools of Engineering and Medicine got off to a great start during the past year. Specifically, Scott Delp, Department Chair and Paul Yock, Co-Chair, successfully completed three wonderful new faculty recruitments (Drs. Karl Deisseroth, Jennifer Cochran and Steve Quake) to help launch the department and also admitted the first group of graduate students. Plans are proceeding for additional faculty recruitments as well as for offering an undergraduate major in the next couple of years.

Further, BioX continues to evolve under the leadership of Dr. Matt Scott, Professor of Developmental Biology and Genetics and Bioengineering. BioX is one of the major interdisciplinary themes of the University, along with the Institute on the Environment and the International Initiative. As noted in prior Newsletters (http://deansnewsletter.stanford.edu/archive/11_01_04.html) BioX includes a number of important programs, such as the Interdisciplinary Initiatives Program, the Advanced Instrumentation Program, the BioX Teaching Initiatives and the BioX Symposia and Seminars. In a number of important ways BioX serves as a prototype of the university of the future. It brings together disciplines from across the University in ways that not only align the physical and life sciences but also create relationships with ethics, the humanities, education, business, etc. This cross-cutting, broad interdisciplinary activity is just one of the ways in which Stanford is unique, and it is clear that it is also an important part of the future of the School and the University.

Patient Care

In the Fall of 2004, Chris Dawes, CEO of LPCH, Martha Marsh, CEO of SHC, and I prepared a draft report describing the common elements of strategic planning within the three entities of the Stanford University Medical Center (SUMC): the School of Medicine (SoM or School), the Stanford Hospital and Clinics (SHC), and the Lucile Packard Children's Hospital at Stanford (LPCH). This effort began in 2001, when the School and the Hospitals initiated a more integrated, comprehensive strategic planning effort to articulate individual and shared institutional priorities within a unified medical center context. The draft report is a work in progress; nevertheless, I provide some of its key elements in the following paragraphs.

Our overarching goal in this strategic planning effort has been to create an exciting, robust and unique plan that truly differentiates Stanford from other healthcare providers,

as well as other academic medical centers. Key to this plan is the recognition of Stanford's unique attributes. These include great strength in basic research, biosciences graduate education and postdoctoral training, a reputation for clinical innovation and discovery, successes in translating new research findings into healthcare improvements for adults and children, and a commitment to the continued delivery of outstanding patient care and clinical service.

Essential to the success of a strategic plan for SUMC is the development and implementation of a sustainable business model that ensures support for on-going programs as well as opportunities for investment in new programs and facilities. Integral to such a business model is an explicit recognition of the extraordinary advantages, balanced against the increasing costs, of program development within the core Stanford campus. External environment issues that may dramatically impact the future of SUMC include potential changes to MediCal and Medicare programs, increasingly aggressive regional competition from Kaiser and Sutter, and employer resistance to continuing annual increases in healthcare premiums. Therefore, as the SUMC business model is developed, the leadership of all three entities are maintaining focused attention on the changing local and national landscape of healthcare delivery and economics and of academic medicine.

The missions within SUMC are both unique and overlapping. Indeed, the shared visions and essential interdependences of the School of Medicine, the Stanford Hospital and Clinics, and Lucile Packard Children's Hospital at Stanford are clearly expressed in each mission statement.

The School of Medicine's mission is to be a premier research-intensive school of medicine that improves health in the twenty-first century through our discoveries, leadership, and innovations in education, patient care, and biomedical and clinical research. The Hospitals are critically important to this mission. Analogously, the mission of Stanford Hospital and Clinics is "to care, educate, and discover for the benefit of our patients and the larger community." The mission of Lucile Packard Children's Hospital is "to serve our communities as an internationally recognized pediatric and obstetric hospital that advances family-centered care, fosters innovation, translates discoveries, educates healthcare providers and leaders, and advocates on behalf of children and expectant mothers." Driven by these shared missions, the SoM, SHC and LPCH leadership teams have developed, and are continuing to refine, an exciting vision that will strengthen Stanford's reputation as a premier Academic Medical Center (AMC).

The key tenets of the vision are:

- *To create knowledge through research and innovation.*
- *To educate future leaders in medicine and the biosciences.*
- To translate discoveries in medicine into efficacious, efficient, and cost-effective clinical care.
- To improve the health of patients with state-of-the-art diagnosis and treatment.

Within this framework, planning to date has been based on three guiding principles. First, SUMC is uniquely positioned to rapidly translate new research findings into clinical care paradigms. Second, SUMC must deliver outstanding patient care and clinical services. Third, a sustainable financial model and its robust execution are critical to supporting the strategic vision.

SUMC is fundamentally an *academic* medical center, deriving its unifying purpose and distinction from its educational and research/innovation missions. While each entity must acknowledge and address the unique financial and social obligations of their respective “businesses,” the educational and research missions are critically important in that they enable our success as an academic medical center.

The School of Medicine strategic plan, *Translating Discoveries* (<http://medstrategicplan.stanford.edu/>), provides an integrated vision for biomedical science and education in the twenty-first century. It seeks to leverage existing strengths across the spectrum of research (basic to clinical) and of education (biosciences graduate and medical) through the creation of cross-disciplinary teams and curricula. The combination of the School’s strategic plan and the SHC and LPCH strategic service lines allows for the emergence of a true academic medical center, unique in its ability to translate discoveries and to prepare physicians and scientists with the skills and understanding needed to confront the chronic as well as the emerging issues of human health.

To this end, each of the School’s Institutes of Medicine has, in addition to a core mission of translational research and translational education, a clinical strategic service line counterpart. These medical center-wide strategic alignments are:

Stanford University Medical Center					
<i>Institutes and Clinical Centers</i>					
School of Medicine		SHC		LPCH	
Stanford Institute for Cancer and Stem Cell Biology	↔	SHC Cancer Center	↔	LPCH Center for Cancer & Blood Diseases	
Neurosciences Institute at Stanford	↔	SHC Neurosciences Center	↔	LPCH Brain and Behavior Center	
Stanford Cardiovascular Institute	↔	SHC Cardiac Center	↔	LPCH Heart Center	
Stanford Institute for Immunity, Transplantation, and Infection	↔	SHC Liver, Kidney, and Pancreas Transplantation Center	↔	LPCH Transplant and Tissue Engineering Center	

The successful and rapid translation of knowledge from the basic sciences to its application to improve the diagnosis, treatment, and prevention of human disease will be one of the most sustainable differentiators for SUMC. Related clinical initiatives at SHC and LPCH are discussed below.

Cancer

Adult Cancer: Cancer is the second leading cause of death in the United States. Currently, about 500,000 of the 9 million people with cancer in the United States live in the Bay Area. Cancer treatment is becoming increasingly outpatient due to advances in diagnostics, drugs, and radiology-based therapies. A new dedicated, patient-focused cancer center, a nationally renowned medical director, and a strong tradition of combining research and clinical excellence are some of the key strengths of the Stanford cancer program. The School is seeking to enhance its cancer programs by applying to the National Cancer Institute (NCI) to become a designated Comprehensive Cancer Center.

Stanford's competitive advantage is based on its leading edge basic and translational research,¹ its focus on patient support as an integral part of the care program, and its multidisciplinary approach to cancer care. This advantage will be enhanced by the work of the Stanford Institute on Cancer/Stem Cell Biology and designation as an NCI Comprehensive Cancer Center.

Near-term strategies that are critical to the program's success include the development of a formalized clinical trials network to drive volume, the pursuit of joint-venture programs at the outer border of the local market, and the development of Stanford oncology outreach programs in the Bay Area.

Successful execution of the above plans and strategies should result in the growth of Stanford inpatient volumes of between 3% and 5% per year through 2008. Outpatient volumes are expected to grow 3% to 6% over the same horizon.

Pediatric Cancer and Blood Diseases: The Center for Cancer and Blood Diseases at LPCH is the market leader for pediatric hematology and oncology care in the Bay Area. It has experienced 9% growth in inpatient activity over the last five years. Many Center faculty members hold leadership positions in the Children's Oncology Group (an NCI-sponsored clinical trials cooperative group), and the majority of our hematology/oncology patients are enrolled in a clinical trial of some type. Future growth will be facilitated by the completion of the new Pediatric Clinical Cancer Center on the first floor of the hospital in FY06. This comprehensive facility will include 27 inpatient beds and a contiguous day hospital and outpatient clinic. Recent recruitments and investments in Cancer Biology and the Center's clinical trial infrastructure will help ensure that the Center remains on the forefront of new developments in clinical care. The recruitment of a new leader of the stem cell transplant program has been achieved with Dr. Ken Weinberg from USC. Recruitments in stem cell transplantation and the recent

¹ Especially in stem and bone marrow cells research and its applications

arrival of Dr. Michael Edwards in neurosurgery will very likely generate dramatic growth in both transplantation and neuro-oncology. The number of brain tumor patients is expected to more than double, and the number of stem cell transplants may triple.

Neuroscience

Adult Neuroscience: Nationally, the neurosciences market is large and growing. Approximately 12 million Americans are living with a neuroscience disease or disorder. Hospital-based neuroscience disorders decreased slightly in the 1990s primarily due to the shift from inpatient to outpatient-based care. Market analyses predict increased demand for care over the next ten years driven by the growth and aging of the population as well as technological innovation. Stanford Neuroscience has significant clinical distinctions, particularly in the treatment of stroke,² Moyamoya's disease, and CyberKnife radiosurgery.

Stanford's competitive advantage in Neurosciences is based on the strong collaboration among neurologists, neurosurgeons, and neuroradiologists; the integration of the neuroscience research and clinical communities; and expertise in minimally and non-invasive surgical techniques. The new Neurosciences Institute at Stanford enhances this advantage. Near-term strategies critical to the program's success include expanding the scope of clinical trials to drive volume, maintaining a technology edge with investments in radiosurgery techniques, and building partnerships with hospitals with limited neuroscience offerings.

Successful execution of these strategies should result in the growth of Stanford inpatient volumes of 2% per year through 2008.

Pediatric Neurosciences: LPCH's Brain and Behavior Center is focused on becoming a leader in translating neuroscience discoveries to innovative methods for diagnosing, treating, and preventing neurological disorders in children. The Center integrates the clinical care, basic research, clinical research, and community outreach activities of the Departments of Neurosurgery, Neurology, and Psychiatry and Behavioral Sciences and the Neuroscience Institute at Stanford. The principal initiative of the Center this past year has been to recruit a nationally preeminent pediatric neurosurgeon to enhance care available for children with brain tumors – which has been achieved with Dr. Mike Edwards. Other priority initiatives for the next several years include: (a) establishing a program to support clinical care and research for Down Syndrome patients; (b) recruiting a senior leader for the Child Neurology Division; and defining new areas of innovation in translational developmental neuroscience. Growth in patient discharges is projected to be more than 60% over the next decade as the Center evolves further into a regional and national referral center.

Cardiac

Adult Cardiac: Cardiac disease is the leading cause of death in America. The population living with cardiac disease is large and growing – approximately 60 million Americans have some form of cardiac disease. Stanford is able to leverage a series of “firsts,”

² SHC recently achieved national recognition as a certified Stroke Center

including the first heart transplant in the U.S., the first heart/lung transplant in the world, and one of the first left ventricular assist device (LVAD) procedures in the world. Stanford dominates the market in programs involving a high percentage of complex procedures. Several of Stanford's most successful cardiac programs have a broad geographical base, with over 20% of the volume for heart transplants, aorta and valve procedures coming from outside the Bay Area. Stanford also has a strong international cardiac market with cardiac patients representing more than 50% of overall international business.

Stanford's competitive advantage is based on its unique capabilities in treatment of thoracoabdominal aneurysms and Marfan's syndrome, its high volume complex procedures with excellent outcomes, its strong linkages to the various research institutes at the SoM as well as other schools at Stanford³, and our preeminence as a Reynolds Foundation Cardiovascular Research Center. The Stanford Cardiovascular Institute will further shape this agenda. .

Near-term strategies critical for the program's success include sustained excellence in translational medicine and program development, developing "win-win" relationships with referring physicians, and increasing high-end, niche program volume from target markets. This will be further enhanced by the recruitment of additional cardiology faculty and further rejuvenation of the cardiovascular surgery program.

Successful execution of the above should result in the growth of Stanford inpatient volumes of 2% per year through 2008 with stronger growth in certain key areas such as aorta valve and heart transplant procedures.

Pediatric Heart Center: The Children's Heart Center is focused on sustaining its leadership position as one of the world's premier centers for the development of new paradigms in the care of children with heart disease based on advances in the fields of bioengineering and molecular biology, and on delivering these advances to the bedside. In contrast to the adult cardiac service at SHC, the LPCH Heart Center is focused on congenital diseases and defects. The Heart Center integrates the clinical activities of pediatric cardiac surgery, cardiac anesthesiology, cardiac intensive care, cardiology, cardiac catheterization and cardiac imaging into a comprehensive service line. The Heart Center is a regional service; SoM cardiac surgeons serve four additional sites in Oakland, Fresno, Sacramento, and Honolulu. Future investments in innovation will focus on fetal diagnosis and treatment, cardiac tissue engineering, minimally invasive and robotic surgery, and pediatric molecular cardiology/cardi thoracic genetics. With additional OR and ICU bed capacity, the Heart Center volumes are projected to increase approximately 30% over the next decade.

⁴ Some examples of linkages include the Cardiovascular Medicine Institute, the Immunology, Transplantation and Infection Institute, the Reynolds Center for Cardiovascular Genetics, the Cardiovascular Magnetic Imaging Research Center, the Lucas Center for Magnetic Resonance Spectroscopy and Imaging, and the Institute for Cancer/Stem Cell Biology and Medicine.

Transplantation

Adult Transplantation: Transplantation is a growing area with the U.S. Approximately 21,000 transplants across kidney, liver, pancreas, and combined kidney/pancreas procedures are performed annually. A leading challenge for this specialty is an insufficient supply of organs. Several of the key trends in transplantation are focused on addressing this challenge and are completely aligned with the distinctive advantages of the Stanford Transplantation program.⁴ Driven largely by the increase in living donor organs, the number of transplants in the United States is steadily growing.

Stanford's competitive advantage is based on its distinction as the leader in the local market in clinical outcomes, its preeminent position in translational research, especially in tolerance induction techniques, and several prominent innovations in patient care including minimally invasive procedures, steroid minimization and avoidance techniques, and antimicrobial prophylaxis (CMV). The new Stanford Institute for Immunology, Transplantation, and Infection as well by our efforts in stem cell research will further advance these programs.

Near-term strategies critical for the program's success include expanding liver and kidney waiting lists through outreach efforts,⁵ being the first to the regional market with an Intestinal Transplant Program, and developing relationships with pharmaceutical companies to encourage clinical trials.

Successful execution of the above should result in the growth of Stanford transplant volumes of between 2% and 5% per year through 2008. A stronger outreach effort could potentially double this growth rate in two to three years.

Pediatric Transplantation: The transplant programs at LPCH are world renowned for their technical skill and their ability to manage complex cases such as very small infants and patients with primary hyperoxaluria, TPN-induced liver disease and other high-risk conditions. According to the United Network for Organ Sharing (UNOS) and the U.S. Scientific Registry of Transplant Recipients, the liver transplant program ranks second in the nation in pediatric volume (29 in CY2003), while the pediatric kidney transplant program records 100% 1-year graft survival and 100% 3-year patient survival. In addition to kidney and liver transplantation, the Center began performing intestinal transplants in FY01 and is the only Center in northern California and the Pacific Northwest to provide this life-saving treatment for children with intestinal failure. Pioneering research in areas such as steroid-free immunosuppression and dialysis in low birth weight infants provides a solid foundation for the outstanding performance of our clinical programs.

Approximately 20 kidney transplants and 25 liver transplants are performed each year at LPCH. New programs such as intestinal transplantation will provide opportunities for

⁵ These include: (a) Minimally invasive procedures, where Stanford is a leader, (b) Tolerance enhancing drugs, where Stanford is among the leaders in less toxic immunosuppressive regimens, (c) Increase in living donations, where Stanford's share is twice the national average.

⁶ With special focus on East Bay, Central Valley, and Las Vegas regions.

future growth. A new expanded LPCH outpatient dialysis center scheduled to open in the 4th quarter of FY05 will double our capacity to provide dialysis to patients awaiting kidney transplant. In addition, an extensive network of outreach clinics spanning northern and central California, Hawaii, Oregon, Washington, and Alaska facilitates referrals and pre- and post-transplant care for liver and intestinal transplant patients.

Other Areas of Clinical Growth and Integration

SHC Orthopedics: A massive demographic shift is beginning as the leading edge of the baby boomers begins to turn 60 in the next two years. This huge segment of the population, which comprises 77 million individuals, will move from early middle age into a period of maximum healthcare utilization. This change is expected to result in a dramatic increase in the demand for a full array of orthopedic services. Orthopedics is a diverse service line comprising several components: (a) Spine Surgery, (b) Sports Medicine, (c) Joint Replacement (Arthritis), (d) Fracture Care, (e) Cancer, and (f) Hand. National market estimates project a 17% growth in inpatient volumes and a 33% growth in outpatient volumes between 2004 and 2015. The recent recruitment of Dr. William Maloney as Chair of Orthopedic Surgery will enable the formation of a Center for Orthopedic and Sports Medicine. Over the next several years we envision adding ten to fifteen new orthopedic faculty, which will double the size of the department. In addition, contingent on program accreditation, we plan to add four fellowships between FY 2006 and FY 2007. We are also planning the activation of an ambulatory orthopedic facility as a part of an ambulatory services facility.

The LPCH orthopedics strategy will be developed in conjunction with Dr. Maloney over the next 12-24 months.

Pregnant Women and Newborns: The Johnson Center for Pregnancy and Newborn Services at LPCH is a comprehensive clinical service line that integrates obstetrical and neonatal services and provides a full continuum of care for pregnant women and newborns. With over 5,200 deliveries each year, the Johnson Center is the third busiest delivery service in the Bay Area. The neonatal service includes 66 beds on-site at LPCH as well as off-site nurseries in three locations (discussed further below). The regional network supporting this service also includes professional service relationships with three additional hospitals. LPCH is presently exploring options for expanding obstetric services at local community hospitals to reduce capacity constraints at this facility, and no additional growth is planned for the service at LPCH. Neonatal services will continue to grow, in coordination with the expansion of other pediatric services both on-site and at off-site locations.

In addition to these internal program priorities, the success of clinical initiatives has required the development of corresponding clinical care delivery strategies for each of our major market segments. Although existing within a single medical center, SHC and LPCH are distinct providers and occupy distinct positions within markedly different healthcare markets. As a result, SHC and LPCH, in conjunction

with the School, have each approached the development of strategic clinical services plans from the perspectives that are most appropriate to their patient base.

SHC is both a teaching hospital and a community hospital. As such, it must attend to its local (community hospital) market as well as the much larger regional, national, and international markets that are required to support the tertiary and quaternary services associated with its academic missions. In contrast, as a specialty children's hospital, LPCH must serve a much larger population base with a predominant focus on tertiary/quaternary care through partnerships with many different provider networks and healthcare systems

In developing this clinical strategy and supporting tactics, only a portion of which is shown here, it is assumed that: (a) Inpatient Services will become increasingly tertiary, surgical, and intensive-care focused, (b) Ambulatory Services will expand and will include both increasingly high-tech services and care of patients with chronic disorders, and (c) Off-site Services will complement those provided at the Medical Center and also act as a feeder to the Medical Center.

Four sustainable differentiators are critical to the execution of the SUMC strategy:

1. SUMC's unique position to deliver cutting-edge clinical care driven by outstanding faculty and the benefits of translational research.
2. SUMC's focus on service excellence that spans the entire patient experience - from getting an appointment, through the clinical event, and all the way to getting a simple and easy-to-read bill.
3. SUMC's recognition that building and sustaining operational excellence must become a core-competency.
4. SUMC's ability to leverage, aggressively but judiciously, the value of the Stanford brand.

The fundamental challenge of the medical center will be transfer these factors into successful clinical program and market strategies while both sustaining and enhancing the education and research mission that make SUMC unique and world class.

The Professoriate and Workplace

With a defined cap on our faculty size of 900 we are a small school of medicine compared to our peers (we are currently in the 750 range. This small size puts a premium on clarity of functions and career paths within our various faculty groups. Significant efforts have been made to better define faculty development according to functions (Investigator, Clinical Scholar/Investigator, Clinician Educator) and to develop the appropriate guidelines to optimize career development. Having further clarified the role of the Clinician Scholar/Investigator in 2002-2003, we focused on the functions of the Clinician Educator in 2004 (http://deansnewsletter.stanford.edu/archive/07_26_04.html). With these various roles in place we have the necessary career pathways to further optimize our academic medical center. We recognize the important but different roles played by those whose primary focus is research, clinical research and patient care, and patient care, although we expect that all faculty will participate in education.

We have also initiated a formal process to address ways of streamlining the faculty Appointments and Promotions process. For the past several months a committee chaired by Dr. Rob Jackler has been working diligently on this important initiative. The group provided a very thoughtful update just before the holidays, and they plan to have their final report by April 2005. A key recommendation is likely be that the School should develop a web-based system that makes the whole process more seamless and expeditious.

Promoting and assuring a Respectful Workplace has been an ongoing initiative during the past three years and will continue into the future. While we all recognize that a complex workplace like the medical school of an academic medical center evokes many stresses and strains, it is an imperative that a code of respect and dignity be achieved among all who work here. We have a policy of zero tolerance for harassment or abuse within the workplace, which we have acted on in the past years and will continue to in those coming. However no policy can be effective without the continued and ongoing efforts and surveillance of our entire community. Should you have concerns please bring them to the attention of Dr. David Stevenson, Senior Associate Dean for Academic Affairs (david.stevenson@stanford.edu), Ms. Cori Bossenberry, Director of Human Resources (corib@stanford.edu), or Ms. Martha McKee, Ombudsperson (martha.mckee@stanford.edu). We will work closely with you and do our very best to resolve any concerns that are raised.

Among our most significant recent accomplishments has been the creation of a new Senior Associate Deanship for Diversity and Leadership and the appointment of Hannah Valantine, M.D. as our first Dean in this area. (See also http://deansnewsletter.stanford.edu/archive/11_01_04.html#1). In 2005 we will undertake the development of a complete strategic plan for this new office that will help to establish our institutional vision and set our programmatic priorities. This effort will be initiated later this month when we devote a major component of the School's annual strategic leadership retreat to an exploration of the many facets of diversity and leadership in academia.

Information Technology

Thanks to the leadership of Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, and his colleagues, considerable progress has been made in further developing the information systems and technology platforms and applications for the School of Medicine.

Perhaps the most visible evidence of change is the comprehensive new Website for the School of Medicine (see <http://www.med.stanford.edu/>). While this is a work in progress it is already an outstanding accomplishment that has contributed significantly to the image of the School and more importantly to the accessibility to a broad array of information.

In tandem with the improvements on the Website per se, IRT also implemented a Web-based Community Academic Profiles (CAP) system that allows faculty to easily maintain

a publicly accessible profile of their scholarly activities while supporting access to this information from multiple locations on the School's Web site. This resource will have significant impact on promoting interactions and collaborations or in simply helping interested individuals to learn more about the work going on at Stanford.

IRT also recently deployed the first phase of a Web-based system that allows public access to information on clinical trials at Stanford. This is most timely and consonant with the recent interest by important constituencies (e.g., NIH, FDA, medical journals, industry and the government) in this topic.

In addition, the School's wireless network has been extended to cover public areas, including Lane Medical Library and major teaching facilities. This has enabled the replacement of many individual-owned insecure wireless access points, which have been replaced with secure wireless technology managed by IRT. A secure data network for School of Medicine users has also been deployed in the new Clinical Cancer Center. Because of the importance of security and privacy, a HIPAA-compliant data center for the School has been instituted along with state-of-the-art network security technology to protect the School's IT infrastructure.

Recently, the Lane Library web site has been redesigned to support integrated searching across multiple knowledge resources, improved access to full-text materials and more flexible off-campus access.

IRT also coordinated an agreement with Lucile Packard Children's Hospital and Stanford Hospital and Clinics to allow the electronic transfer of clinical data from both hospitals into the School's new STRIDE research data repository. STRIDE (Stanford Translational Research Integrated Database Environment) is a standards-based repository of clinical and research data designed by IRT to support the School's translational research mission.

Another advance has been the recent inauguration of the Strategic Center for Clinical Informatics, a new academic entity at the School focused on applied informatics research and training. Its goal is to contribute to the development of world-class information technology solutions supporting human health.

Finance and Administration

When an administration works well, it should be able to make the work of the school happen without too much fanfare. That said, the complexities of an academic medical center – with its intricate alignments (and sometime misalignments) between faculty, their departments, the School, University and affiliated Hospitals – can pose quite a challenge.

Despite the many challenges we face, the School remains financially healthy with an endowment balance (as of August 31, 2004) of \$1.404 B and consolidated expendable fund reserves of \$360,341,000. While this is encouraging, it is important to note that the majority of these endowment and expendable funds are in restricted pools and most reside in the departments. Thus their availability for new school-wide initiatives is

limited.

Our overall FY05 consolidated budget for the School is \$816M (exclusive of the affiliated hospitals) but the demands we face going forward are considerable, especially if we are to fully realize our strategic initiatives in *Translating Discoveries*. While I have no doubt that we will continue to make progress, we will need to make strategic choices and set our priorities and timelines. As much as we would like to proceed with all the desired faculty recruitments or program developments as rapidly as possible, we will need to plan for these to unfold on a multi-year basis. A number of these recruitments will be focused in the Stanford Institutes of Medicine whereas others will be based in departmental programs.

The not infrequently contentious flow of funds between the School and Affiliated Hospitals has been an important issue (as it is in virtually every academic medical center). While a panacea is unlikely, a joint workgroup represented by School and SHC leaders has spent considerable effort and many dozens of hours since the early Fall by to develop a more effective model for “funds flow”. It is anticipated that an appropriate model will be ready to implement for the FY06 budget process that will commence this Spring. Obviously more will be reported on this important topic.

One of our most significant challenges (indeed one for the entire medical center) is facilities. We have a critical need to replace our education and library facilities as well as to develop additional laboratory research space. As you likely know we have been working on a medical school master plan for some time. Over the past year have coordinated these plans with both Stanford Hospital & Clinics and Lucile Packard Children’s Hospital to construct a medical campus facilities plan. This is still an organic work in progress but it does look forward over the next 10-25 years to address the critical needs that exist to support our missions in education, research and patient care. The School of Medicine has also worked closely with the University in the development of the Science, Engineering and Medicine Campus (SEMC). This plan will result in a new Science and Engineering Quad as well as our School of Medicine Learning and Knowledge Center and the Stanford Institutes of Medicine #1 Research Laboratories. Raising the funds for these facilities is one of our most important current tasks since it remains our hope to have construction completed within the next several years.

Communications, Government Relations and Advocacy

During the past year the School’s communication strategy has become much more refined thanks to the leadership of Paul Costello and his staff. Given the importance of assuring that our message is well conveyed both within the university and to our surrounding communities – locally and globally – it is imperative that we pursue a number of vehicles to best optimize our agenda. While there have been a number of cogent examples during the past year, I believe that the Fall 2004 issue of our magazine *Stanford Medicine*, which focused on “The Science and Politics of Stem Cell Research” (<http://mednews.stanford.edu/stanmed/2004fall/>), best demonstrates an integrated

approach to communication, science education and public policy. Indeed, this issue, which was distributed nationally as well as in California, played an important role in educating policy makers and other leaders about the important issues surrounding the topic of stem cell research. While the passage of Proposition 71 on November 2nd and the subsequent establishment of the California Institute for Regenerative Medicine was due to the efforts of many – and especially the trust of the voting public in California – there is no question that Stanford played an important role in this process. In addition to the publications and communications, the advocacy by Stanford scientists Paul Berg, Irv Weissman and others also played a key role.
(http://deansnewsletter.stanford.edu/archive/11_15_04.html#1).

In tandem with the communication efforts, our efforts in government relations have also focused on the national debate regarding stem cell research as well as a number of key topics involving the National Institutes of Health. These range from serious issues emerging from violations of conflict of interest at the NIH to the NIH budget and, as we move to 2005, the reauthorization of the NIH. Given the central role that the NIH plays in the life and integrity of the biomedical research establishment, and especially for research-intensive schools like Stanford, these issues are of critical importance.

Development and Philanthropy

Medical Schools have a number of missions, most of which require additional financial support to be successful. For example, tuition hardly covers the cost of education and, while Stanford is quite successful in competing for research dollars from the NIH or private foundations and sources, additional institutional support is necessary to cover the cost of carrying out a highly successful research program. While in the past clinical care programs served as a source to help support education and research, this source has become much more constrained in the past 15 years through the pressures of managed care, etc. Accordingly, medical schools (like universities) are highly dependent on the support that comes from private donors and foundations to help fund and support mission critical programs.

Without question we are fortunate to have accrued a significant endowment for the School of Medicine. While the endowment is essential to our financial success, it is not sufficient to allow us to develop the exciting new programs laid out in our Strategic Plan, *Translating Discoveries*. Certainly we must be enormously grateful to all who have provided financial support to Stanford Medicine in the past and who continue to do so today. While the results of our Medical Development Program have been gratifying, we do believe that we can – and must – do better. Accordingly, we are pleased to welcome Mr. Doug Stewart as the Associate Vice President for Medical Development. Mr. Stewart joined Stanford in October and has been working hard on developing a plan that will underpin our Medical Center Capital Plan. Many hundreds of millions of dollars over the next decade will be required to support new facilities for education, research, and patient care and their related programs. Coordinated efforts between the School and Hospitals and between the Medical Center with the University will be essential. Indeed, our very future as a leading research-intensive medical school will depend on the success of these

philanthropic efforts and capital campaign. I certainly pledge to do all that I can to help support this important effort.

Planning for Regenerative Medicine Initiatives

As I mentioned in the December 13, 2004 Dean's Newsletter, we are instituting a number of plans to organize our efforts in stem cell research so that we can be as prepared as possible to contribute to the efforts of the newly established California Institute on Regenerative Medicine (CIRM). As you will recall the CIRM will oversee the implementation of the \$3 Billion approved by the State of California for stem cell research. To assure that our faculty and Stanford community are optimally engaged and informed, several committees and subcommittees are being formed within the Stanford Institute for Cancer/Stem Cell Biology.

These plans will include a ***Program In Regenerative Medicine (PRM) Advisory Committee*** that is charged to initiate and coordinate all Stanford efforts in Regenerative Medicine. The PRM Advisory Committee will be chaired by ***Dr. Michael Longaker, Deane P. and Louise Mitchell Professor***. Among its responsibilities, the PRM Advisory Committee will establish and coordinate PRM subcommittees (see below), advise the CSCI Steering Committee and Director, communicate opportunities in regenerative medicine to all interested Stanford faculty and set priorities and processes for proposals to the CIRM. There will be five subcommittees under the PRM including:

1. ***The Regenerative Medicine Research Subcommittee, chaired by Dr. Roel Nusse***, will coordinate and disseminate information from the CIRM regarding investigator-initiated grants, program-project grants, inter-California collaborative initiatives, etc. This subcommittee will also serve as an internal group to generate new ideas for stem cell research and to facilitate the development of research proposals.
2. ***The Regenerative Medicine Education Subcommittee, chaired by Dr. Minx Fuller***, will establish and oversee a seminar series in stem cell biology and regenerative medicine. In addition, this subcommittee will help develop the proposal for a Scholarly Concentration for medical students in stem cell biology and regenerative medicine and will also develop relevant programs for graduate students and postdoctoral trainees. Further, this subcommittee will coordinate education programs among BioX, Bioengineering, H&S, the School of Medicine and other interested partners at Stanford.
3. ***The Regenerative Medicine Bioethics and Conflict of Interest Subcommittee, chaired by Dr. David Magnus***, will establish, monitor and communicate internal policies and procedures for the conduct of stem cell research and associated clinical practices, within accepted bioethical guidelines. Further, this subcommittee will establish, monitor and communicate internal policies and procedures for identifying and avoiding conflicts of interest in the conduct of stem

cell research. In addition, consult services for bioethical evaluation of stem cell research proposals will be developed.

4. ***The Regenerative Medicine Human Embryonic Stem Cell/Nuclear Transplantation Operations Subcommittee, co-chaired by Drs. Linda Giudice and Julie Baker***, will develop policies and processes to carry out derivation and maintenance of human embryonic stem cell and human nuclear transfer stem cell lines. This subcommittee will also coordinate relevant Stanford IRB and CIRM efforts for developing the processes for submission of proposals involving human embryonic stem cells or nuclear transfer proposals. The subcommittee will also explore the establishment of GMP facilities and develop policies for the distribution and sharing of cell lines, etc (including Material Transfer Agreements).
5. ***The Regenerative Medicine Facilities Committee, chaired by Dr. Michael Longaker***, will take the lead in preparing the facilities grant to the CIRM and will also develop and recommend policies and procedures to ensure compliance with Federal Human Stem Cell restrictions and guidelines.

We expect that the PRM Advisory Committee and its five subcommittees will orchestrate our Stanford wide opportunities for taking a leading role in stem cell research. As noted earlier the Cancer Stem Cell Institute and PRM Advisory Committee are planning a Retreat for Monday January 31st (rescheduled from the one mentioned in the Dean's Newsletter for December 15th). Details regarding this Retreat will be forthcoming. If you have questions feel free to contact Dr. Longaker (longaker@stanford.edu) or Dr. Giudice (giudice@stanford.edu).

Everything in Perspective

I doubt there is anyone not directly affected by the overwhelmingly tragic effects in Asia who did not immediately put their own life issue into a different perspective. I am also certain that many in our community have done whatever they can to reach out in support of the victims of the Tsunami in whatever ways are feasible. The Lucile Packard Children's Hospital has provided help to children impacted by the Tsunami, and I refer you to their article on their homepage at <https://lpchintranet.stanfordmed.org/>. Dr. Yaso Natkunam, a Sri Lankan physician in the Department of Pathology, will be traveling to Sri Lanka as a volunteer for the relief efforts. While some relief agencies, such as Doctors Without Borders, have received sufficient volunteers and funds to carry out their operations, many smaller organizations are still in need of help. Money is the most important thing they need. If you are interested you can make donations to the International Medical Organization at <http://www.thousa.org/index.htm>. Contributions to UNICEF, the WHO or Red Cross are also appreciated. Their websites are listed at <https://lpchintranet.stanfordmed.org/>.

Appointments and Promotions

- **Anna Bruckner** has been appointed Assistant Professor of Dermatology and Pediatrics at the Stanford University Medical Center, effective 12/1/2004.
- **Howard Chang** has been appointed to Assistant Professor of Dermatology at the Stanford University Medical Center, effective 12/1/2004.
- **John Desmond** has been reappointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 2/1/2005.
- **Gabriel Garcia** has been promoted to Professor of Medicine (Gastroenterology and Hepatology) at the Stanford University Medical Center, effective 12/1/2004.
- **Kenan Garcia** has been promoted to Associate Professor of Microbiology and Immunology and Structural Biology, effective 1/1/2005.
- **Jill Helms** has been appointed to Associate Professor of Surgery at the Stanford University Medical Center effective 1/1/2005.
- **Youn Kim** has been promoted to Professor of Dermatology at the Stanford University Medical Center, effective 12/1/2004.
- **Clete Kushida** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 12/1/2004.
- **Craig Levin** has been appointed Associate Professor (Research) of Radiology at the Stanford University Medical Center, effective 1/1/2005.
- **Linda Lotspeich** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 12/1/2004.
- **Tobias Meyer** has been promoted to Professor of Molecular Pharmacology at the Stanford University Medical Center, effective 12/1/2004.
- **Robert Mindelzun** has been reappointed to Professor of Radiology at the Stanford University Medical Center, effective 9/1/2004.
- **Marc Pelletier** has been appointed to Assistant Professor of Cardiothoracic Surgery at the Stanford University Medical Center, effective 12/1/2004.
- **Joseph Presti** has been promoted to Professor of Urology at the Stanford University Medical Center, effective 12/1/2004.
- **Terry Robinson** has been reappointed to Assistant Professor of Pediatrics (Pulmonary) at Lucile Salter Packard Children's Hospital, effective 2/1/2005.
- **David Schneider** has been reappointed to Assistant Professor of Microbiology and Immunology at the Stanford University Medical Center, effective 1/1/2005.
- **Donald Schreiber** has been promoted Associate Professor of Surgery at the Stanford University Medical Center, effective 12/1/2004.

Dean's Newsletter

January 24, 2005

Conflict of Interest

At Universities and Academic Medical Centers faculty have the opportunity to engage in a number of outside activities that can include consulting, advising, and lecturing, to name just a few. These can be enriching and rewarding opportunities. At the same time, among the most important responsibilities we have as members of an academic community is to conduct such activities in a manner free of conflicts of interest or commitment. While strictly avoiding conflicts of interest or commitment is important for every member of the Stanford faculty, it is particularly relevant for the School of Medicine, where engagement in clinical trials and research elevates the importance of assuring the public trust.

During the past year attention to violations of conflict of interest has increased in press and congressional inquiries due to reports about NIH officials or researchers who appear to have violated guidelines for consulting with pharmacy or biotech. These violations are, in part, related to a change in NIH guidelines that date back to 1995. Prior to that time, the NIH had strict prohibitions on consulting and receipt of honoraria, and members of the NIH community were not permitted to own stocks or equity in companies with which they consulted or received honoraria. Further, individuals at the NIH who had oversight over extramural grants and contracts or who held leadership positions (Institute Directors, Scientific Directors, etc.) were not permitted to engage in "outside activities" in which they received a fee for consulting. When more lenient government-wide changes in ethics rules went into place in the early 1990's, the NIH did not pursue a special "supplemental" modification and thus the prior stricter rules went into abeyance.

More specifically, previous limits on consulting arrangements including the ability to assume equity or receive stock options were relaxed. In addition, prior limits on time for consulting or on rank were removed. While the goal was to permit the NIH scientists or officials to have greater flexibility or opportunity (to help both recruitment and retention), the new policies actually went beyond those at most academic institutions. That said, most all NIH members appear to have been careful to seek permission for their activities, and they reported according to the guidelines that were made available. The problem, however, was twofold: First, the relaxation of the guidelines created opportunities for some NIH investigators and Institute directors or leaders to give the perception that they were violating conflicts of interest or commitment. Second, and unfortunately, some members of the NIH community appeared to engage in various consulting arrangements but did not seek permission or report their activities to the NIH ethics offices. Together these created a significant liability for the NIH, as evidenced by the public and congressional scrutiny that has now resulted in a ban on all outside activities for members of the NIH.

Last year NIH Director Elias Zerhouni appointed me to a "Blue Ribbon Panel" whose purpose was to provide guidance on conflict of interest policies and procedures for the

NIH. My colleagues and I worked diligently to provide sensible and sustainable recommendations. While I believe the Panel accomplished those goals, the climate in Bethesda and the Congress changed sufficiently (in part because of unexpected revelations of additional infractions) to result first in even stricter guidelines and, more recently, in a one-year ban on all consulting by NIH scientists and employees. Clearly this outcome reflects a loss of confidence in the current system. It also has had a significant impact on the morale of the NIH community. Perhaps most significantly affected are “intramural investigators”, nearly all of whom have no oversight over extramural grants or contracts and who, for the most part, operate quite comparably to scientists working in academia or private research institutes. The important lesson is that once public confidence and trust have been lost, it is hard to reclaim the high road.

At Stanford we have strict guidelines regarding Conflict of Interest and Commitment. In the recent publication entitled “Code of Conduct,” conflict of interest and conflict of commitment are included among eight key areas that require faculty and staff attention. In this publication it is noted that:

Community members who are Stanford faculty and staff owe their primary professional allegiance to the University and its mission to engage in the highest level of education, patient care, research and scholarship. Outside professional activities, private financial interests or the receipt of benefits from third parties can cause an actual or perceived divergence between the University mission and an individual’s private interests. In order to protect our primary mission, community members with other professional or financial interests shall disclose them in compliance with applicable conflict of interest/conflict of commitment policies, which are available on the following websites:

- ***Faculty Policy on Faculty Conflict of Commitment and Interest:***
<http://www.stanford.edu/dept/DoR/rph/4-1.html>
- ***Staff Policy on Conflict of Commitment and Interest:***
http://adminguide.stanford.edu/15_2.pdf
- ***Academic Staff Policy on Conflict of Commitment and Interest:***
<http://www.stanford.edu/dept/DoR/rph/4-4.html>

On Friday, January 21st, we discussed Conflict of Interest issues at our Executive Committee. Dr. Harry Greenberg, Senior Associate Dean for Research, Graduate Education, and Postdoctoral Affairs, and Ms. Barbara Flynn, Manager of the School of Medicine’s Conflict of Interest Review Program, described the elements of the Program for us.

All faculty must file a Conflict of Commitment and Interest Certification annually. In addition, faculty must disclose, *as they occur*, grants or contracts, human research protocols, licensing activities, gifts, material transfer and collaboration agreements, and purchasing. The School also requires the disclosure of any financial interest or

relationship with a company where: (a) the company's interests are related to the research; (b) the company is sponsoring the research, or (c) the company is a vendor, supplier, or provider of materials, equipment, drugs or devices being used in the research.

Furthermore, significant financial interests must be disclosed. These include financial interests over \$10,000 in monetary value, interests that involve the ownership or promise of stock options over \$10,000 or 0.5% of the total value of the company in a publicly traded company, or interests that involve the ownership or promise of stock or stock options of any amount in a privately held or start-up company. Financial interests above these thresholds will automatically require closer scrutiny and possible elimination, mitigation, and/or management. Research involving human subjects above these thresholds is prohibited unless conflicted investigators provide compelling reasons justifying their involvement in the research and the Conflict of Interest Committee approves their involvement and management of the conflict is in place.

Dr. Greenberg and Ms. Flynn also described the initiatives underway for 2005. These include the development of a required online conflict of interest training module and enacting in written policy the practice of revoking research privileges when annual disclosures are not completed in a timely fashion (6 weeks). They also intend to develop a set of simple and concise set of Q&A describing Stanford's conflict of interest policies and to develop better guidance for faculty on conflict of interest and conflict of commitment, particularly pertaining to the generation of intellectual property during consulting arrangements.

The Conflict of Interest Committee consists of Drs. Harry Greenberg, Chair, Helen Bronte-Stewart, Mildred Cho, Ron Levy, Ed Mocarski, Rich Popp, and David Spiegel. This committee is doing critically important work on behalf of the School, and we greatly appreciate their efforts. Questions about conflict of interest and commitment should be directed to Barbara Flynn, at Barbara.Flynn@stanford.edu.

It should be noted that the guidelines regarding conflict of commitment and interest are just one aspect of Stanford University's Code of Conduct, which defines "the ethical, professional and legal standards we use as the basis for our daily and long-term decisions and actions." These also include standards of integrity and quality, confidentiality and privacy, human resources, financial reporting, compliance with laws, use of University resources, and reporting suspected violations. The Stanford Code of Conduct may be found at <http://codeofconduct.stanford.edu>. Our School of Medicine initiatives on the Respectful Workplace (http://deansnewsletter.stanford.edu/archive/11_01_04.html#4) fit within the context of the Code of Conduct as well. Each of these initiatives has an impact on the overall quality and integrity of our community.

Goals for the Upcoming School of Medicine Leadership Retreat

Beginning later this week (January 27 – 29th) we will hold our annual School of Medicine Leadership Retreat, the fourth since my arrival in April 2001. These events are attended by basic and clinical science department chairs, institute directors, senior deans and

program leaders, representatives of medical students, graduate students, residents, research and clinical fellows, hospital CEOs and strategic planning directors, and members of the University leadership as well as Board of Trustee members. As in past years, this will amount to about 75 individuals, who will be joined by several invited guests.

Our past three Strategic Leadership Retreats have focused on developing, shaping, implementing and assessing our plan *Translating Discoveries* (<http://medstrategicplan.stanford.edu>). While this remains a very important School-wide initiative, I felt it was important to modify the focus and venue of this year's retreat. The central theme will be how we, as a school of medicine, address the critically important issues of diversity and leadership. While these themes are not new, it is our intention to give them a very high visibility and commitment as we move forward. Indeed I believe that one of our most important goals must be to enhance the gender and racial diversity of our school, enrich the career paths for faculty, students and staff, and develop mechanisms to promote leadership skills and opportunities for our members of our community.

To help guide and provoke the discussion, we have invited Anna Deavere Smith, professor at the Tisch School of Arts and the former Ann O'Day Maples Professor of the Arts in the Department of Drama at Stanford, to stage a performance based on her study of Stanford faculty, students and community this past Fall. The goal is to provide a reflection of our current reality as a means for stimulating a dialogue about how we can create a renewed agenda on diversity for the 21st Century. In addition to Professor Deavere Smith, we will also be joined by Dr. David Satcher, Director of the National Center for Primary Care at the Morehouse School of Medicine and former US Surgeon General and by Dr. Freeman Hrabowski, President of the University of Maryland, Baltimore County. Dr. Hrabowski is also Director of the Meyerhoff Program, which has achieved great success in fostering the interest of under-represented minorities in careers in engineering and science and preparing them for graduate education at the best institutions in the country.

In tandem with presentations from our guests, we will have small and large group discussions among the retreat attendees. Through the discussions we will refine and shape our plans for enhancing diversity and leadership among our faculty, students and staff in the School of Medicine.

We will also have the opportunity to learn about the plans underway to develop three Strategic Centers (Informatics, Imaging, and Genomics and Human Genetics) that will complement our four Stanford Institutes of Medicine. In addition, I will reflect on some of the major challenges we face as an academic medical center and how we might address the important question of discerning how we might be best configured to optimize our future in the 21st Century. Finally, at the conclusion of the retreat, we will have an update on the planning underway for both the University Capital Campaign as well as that of the School of Medicine.

Overall, this promises to be an exciting, provocative and important event. As always, I wish that every member of our community could be there to participate but alas, that is not possible. I will, however, do my best to communicate an update on the retreat in the next Dean's Newsletter and, as appropriate and needed, to have "town hall meetings" to permit broader discussion of key initiatives.

A Perspective and Opinion on the Proposed Law School and Graduate Housing Project

By now most members of the Stanford community have heard something about the plans for the Law School and Graduate Housing Project that is possible thanks to a significant gift to the University by Mr. Charles Munger (<http://news.service.stanford.edu/news/2004/december1/munger-1201.html>). For a number of reasons this project has provoked considerable debate, which stems largely from its size and location and the presumed consequences on its immediate neighborhood, which is proximate to the Law School. Indeed, a number of objections have been raised by active and emeritus faculty who are residents in the neighborhood near the planned project, as well as other members of the Stanford community. I respect the concerns that have been expressed and would like to speak to them both as faculty member as well as a resident (I live only a couple of blocks away from the planned project and will travel the affected area a number of times each day).

While changes in university landscape evokes different responses depending on one's personal perspective and biases, it seems clear that in future years there will be an increasing density on the core campus in order to accommodate to the expanding programmatic and residential demands of our Stanford community. Most everyone resonates to large open spaces, bucolic walkways, minimal traffic, etc. However, such an environment doesn't necessarily address the real needs of students and faculty.

Because of our location, the University has made special efforts to accommodate as many students as possible on campus along with a wide array of faculty housing. While there is no question that the planned Law School and Graduate Housing Project is large – it will offer 600 beds – it is also true that it will permit a unique residential environment for Law School students that will help make Stanford's already outstanding Law School even more distinctive and special. This residential environment will be further enriched by providing housing for graduate students from other schools – thus expanding the diversity and quality of life for a broad spectrum of Stanford graduate students. While some argue that the nature of the proposed housing (larger rooms, more amenities) detracts from the project, it is hard for me to believe that quality facilities will not improve the overall life experience of individuals who are working hard and whose home and family life deserve as much dignity as is possible.

But there are additional benefits of this project that are also quite important. Undergraduate students will benefit as more graduate students relocate to the Law and Graduate Housing facility – thus opening spaces in the undergrad dorms. This will permit senior undergraduates to have single rooms and will also decrease the number of

undergraduates who are currently crammed into space designed for fewer students. Hence both undergraduate and graduate students will benefit from this project.

In addition, because the residential housing will fulfill the requirements of the General Use Permit (GUP) it will be possible to proceed with plans for additional academic building developments. Key among these are the Science, Engineering and Medicine Campus (SEMC), which includes the School of Medicine's Learning and Knowledge Center as well as Stanford Institutes of Medicine #1.

Thus, while it is certainly possible to cite the negative features of this large ambitious project, the facts that the Law School will become even more exceptional by creating a residential professional school environment, that all graduate and undergraduate students will benefit from the expanded housing opportunities, and that other key academic building projects will be able to proceed, make this a project worthy of support.

I recognize, along with others, that the increased concentration of students proximate to the Law School and abutting on neighboring faculty homes will increase traffic, density and noise. As mentioned, since I live in the general area, I am certainly cognizant of these challenges. But I actually like the idea of having more students in "the neighborhood." After all, that is one of the reasons for choosing to reside on the campus. And I appreciate the overall benefits that this project will offer to our greater community. Accordingly, I suggest that our School of Medicine community become better informed about the overall benefits of this project and that we offer our support to it.

New School-wide Information Technology Support Model

On Monday January 24, 2005 the Office of Information Resources and Technology (IRT) will inaugurate a new information technology (I.T) user support model for the School of Medicine. This new model will provide desktop computer support for ALL faculty, staff and students at the School.

Beginning January 24, 2005 if you have an I.T. problem, you should first call the IRT Desktop Support Help Desk at 5-8000 (725-8000). The Help Desk operates Monday-Friday from 7 AM until 7 PM. Outside of these hours IRT will provide an emergency help desk service at the same number where messages left will page an on-call technician.

Most problems may actually be solved while you are on the phone. If you currently receive I.T. support from departmental I.T. support staff, that support will continue. However, as of January 24, all School of Medicine departmental I.T. support will be coordinated through the School's new I.T. Help Desk. Call 5-8000 as your first step when seeking I.T. support. Problems that cannot be resolved remotely by the IRT Help Desk will be routed to your local I.T. support personnel, who can provide on-site assistance.

You can also get information on the new Help Desk by visiting the IRT Web Site at: http://med.stanford.edu/irt/desktop_support/

Update on the California Institute for Regenerative Medicine

In the January 10 Dean's Newsletter (<http://deansnewsletter.stanford.edu/#2>) I provided an update on the various program and oversight committees that our Stanford Institute for Cancer/Stem Cell Biology will be providing. The Institute and the Program in Regenerative Medicine Advisory Committee are planning a retreat for Monday, January 31st. If you have questions about this retreat please contact Dr. Michael Longaker (longaker@stanford.edu) or Dr. Linda Giudice (giudice@stanford.edu). We will keep you apprised of the results of the retreat and of other progress at Stanford in this area.

As many of you know, I was appointed by State Controller Steve Westly to serve on the Independent Citizen's Oversight Committee (ICOC), which oversees the California Institute on Regenerative Medicine. This has been an interesting process to date, in part because the press has had a series of critical commentaries on the progress of the Institute and the ICOC. Without question, in light of the commitment of the state and its citizens to this initiative, there is every reason for heightened expectations. It is clearly important to move promptly in developing the infrastructure and policies to enable the awarding of the competitive research and facility awards that are the heart and soul of the initiative. But it is also important to be wary of moving forward before the appropriate policies have actually been put into place. Since the ICOC did not have the authority to hire staff or spend any resources until January 6th, it is essential to measure progress in a reasoned manner. One of the critical next steps is the selection of the President of the Institute. The role of the President is described as follows:

The President's responsibilities are to serve as the chief executive of the institute; to recruit the highest scientific and medical talent in the United States to serve the institute on its working groups; to serve the institute on its working groups; to direct ICOC staff and participate in the process of supporting all working group requirements to develop recommendations on grants, loans, facilities, and standards as well as to direct and support the ICOC process of evaluating and acting on those recommendations, the implementation of all decisions on these and general matters of the ICOC; to hire, direct, and manage the staff of the institute; to develop the budgets and cost control programs of the institute; to manage compliance with all rules and regulations on the ICOC, including the performance of all grant recipients; and to manage and execute all intellectual property agreements and any other contracts pertaining to the institute or research it funds.

We will keep you informed of further developments in the establishment of the Institute.

Some Notable Events

- ***Interventional Cardiology Professorship***: On Monday January 10th, a dinner was held in the Cantor Arts Museum to honor the first incumbent of the Professorship in Interventional Cardiology. This event was particularly meaningful because the

individuals who donated the Professorship, **Dr. Simon Stertzer**, Clinical Professor of Medicine (check this) and his wife Kimberly, were present for the event. The first incumbent of this professorship is **Dr. Alan Yeung**, Co-Director (Clinical) of Cardiology and a leading expert in the field of interventional cardiology. Congratulations and appreciation to Dr. Yeung and to Dr. and Mrs. Stertzer respectively.

- ***Stanford Alumni Events.*** On Saturday January 22nd, the School of Medicine participated in the Stanford in San Francisco Event. We hosted a session on stem cell biology and policy that featured presentations and a panel discussion with Drs. Philip Pizzo, Paul Berg and Irv Weissman. This event afforded an opportunity to inform the broader Stanford community about our important initiatives in the School of Medicine and the important role that stem cells are playing. In addition to reviewing the basics of stem cell biology we also had the opportunity to review a number of the important breakthroughs being made by members of our Stanford faculty in this exciting area of research.
- ***Dance Marathon:*** Over the years, “dance marathons” have become popular on university campuses and have served as a source of charitable contribution from students and their supporters. This year, Stanford students held a 24-hour dance marathon from Saturday January 22nd to Sunday January 23rd. Because the focus of this year’s support was to the Elizabeth Glaser Pediatric AIDS Foundation, an organization promoting research in pediatric AIDS and other diseases impacting children, and because I have been a long-standing member of the Foundation and serve as its Vice Chair, I had the opportunity to participate in the last phase of this remarkable event. Putting aside the fact that I would prefer (truly hands down) to run a marathon rather than to dance one, I extend heartfelt congratulations to those who participated. I am awed by their energy and enthusiasm and deeply appreciative of their kindness and generosity.

Wear Red on February 4th - National Go Red for Women Day.

I have received the following announcement from Women’s [Health@Stanford](#), the Stanford Prevention Research Center, and the Preventive Cardiology Clinic. I urge you to participate in this worthwhile endeavor.

The American Heart Association’s **Go Red For Women** initiative is designed to raise awareness of cardiovascular disease, the No. 1 killer of women in America. Through the **Go Red For Women** campaign, the American Heart Association seeks to improve women’s heart health by providing education and tools about women and heart disease to: the general public (to help women reduce their risk by providing information on healthful eating, exercising, quitting smoking, maintaining a healthy weight, blood pressure and blood cholesterol, and controlling diabetes); to healthcare professionals (to ensure that women are treated according to the American Heart Association’s

guidelines); and to federal, state and local policy makers (to encourage them to support policies to improve women's cardiovascular health).

The American Heart Association also advises learning your family's medical history and visiting your doctor to find out if you are at risk for heart disease or stroke. If a healthy diet and regular exercise aren't enough, ask your doctor about medication and take it as prescribed. Even if women take medication, a healthy diet and exercise are still important. Heart disease, stroke and other cardiovascular diseases claim more women's lives each year than the next five causes of death combined, and nearly twice as many as all forms of cancer, including breast cancer. **Go Red For Women** will raise women's awareness of this major health problem. Call 1-888-MYHEART or visit <http://www.americanheart.org/presenter.jhtml?identifier=3017091> for more information. **Wear Red on February 4th** to show your support.

Appointments and Promotions

- **David Cassarino** has been appointed to Assistant Professor of Pathology and Dermatology at the Stanford University Medical Center effective 2/1/2005.
- **Ching-Pin Chang** has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 2/1/2005.
- **Chang-Zheng Chen**, has been appointed to Assistant Professor of Microbiology and Immunology at the Stanford University Medical Center, effective 2/1/2005.
- **David Clark** has been promoted to Associate Professor of Anesthesia at the Veterans Affairs Palo Alto Health Care System effective 1/01/05.
- **Rochelle Dicker** has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center effective 1/1/2005.
- **Nancy Fischbein** has been appointed to Associate Professor of Radiology at the Stanford University Medical Center effective 1/1/2005.
- **Mary Goldstein** has been promoted to Professor of Medicine (Center for Primary Care and Outcomes Research) at the Veterans Affairs Palo Alto Health Care System effective 1/1/2005.
- **Jason Gotlib** has been appointed to Assistant Professor of Medicine (Hematology) at the Stanford University Medical Center effective 1/1/2005.
- **Christina Kong** has been appointed to Assistant Professor of Pathology at the Stanford University Medical Center effective 3/1/2005.

- **Bassem Safadi** has been appointed to Assistant Professor of Surgery at the Veterans Affairs Palo Alto Health Care System effective 6/1/2005.
- **Julie Theriot** has been promoted to Associate Professor of Biochemistry and of Microbiology and Immunology at the Stanford University Medical Center, effective 2/1/2005.

Dean's Newsletter February 7, 2005

Charting the Future and Pondering Some Important Questions

Our annual Strategic Planning Retreats have permitted us to bring our leadership community together to address key initiatives and challenges and to chart the future course of the School of Medicine for the 21st Century. From January 27-29th a group of 80 leaders from the School, Medical Center and University met to reflect on the current status of the School and to assess the status of our efforts to fulfill our Strategic Plan “*Translating Discoveries*” (see <http://medstrategicplan.stanford.edu/>). This year's retreat also had a special focus on how we will address the important challenge of enhancing the diversity and leadership development of our community. (see below).

I was enormously pleased with the outcome of our discussions and debates at the retreat. I believe we forged a closer alignment among our leaders that will allow us to further Stanford's position as a role model among the nation's leading research-intensive schools of medicine. For that I want to thank and acknowledge the participation and commitment of our basic and clinical science chairs, medical and graduate student as well as resident and fellow leaders, staff representatives and the Dean's leadership group, for their diligence, creativity and vision. Of course it is important to acknowledge that a vision for the future is only one component of the complex equation for change. Equally if not more important is the resolve to implement and carryout proposed change – even when it is associated with a need for individual and institutional evolution – if not revolution.

In my “State of the School” address at the beginning of the retreat and in my reflections on “Charting the Future” that closed the event, I summarized the very significant progress we have made during the last several years. I included in my remarks our missions of medical and graduate education, fellowship and postdoctoral training, basic and translational research, patient care, workforce and professorial development, the deployment of novel information technology, and administrative alignments and financial performance, as well as communication strategy, advocacy and medical development. I think all would agree that the School of Medicine has evolved considerably during the past several years. While we can be proud (and I grateful) for the progress that has been made, we still have much to do in what I am confident will always be an organic, iterative and dynamic process of personal and institutional development. (See also Dean's Newsletter Jan 10th: http://deansnewsletter.stanford.edu/archive/01_10_05.html).

Accordingly, I invited the attendees to reflect on a question that is of fundamental importance to the future of Academic Medical Centers (AMCs). Specifically, I asked, if one were starting from a clean slate in 2005, how would an academic medical center and medical school be organized to serve as a vital resource for education, research and patient care in the decades ahead? In that context, I further asked whether the departmentally based structure that exists at nearly every AMC, including Stanford, which in many ways dates back nearly a century to the origin of AMCs in the post-Flexnerian era, would still be ideal or even appropriate.

While history and tradition shape the present, they can also sometimes constrain and even limit progress and evolution. Professions, disciplines and institutions can become captive to past traditions and may be reluctant to address new challenges and opportunities. Because medical science has changed so dramatically during the past several decades, and since new technical innovations have opened new horizons and breached traditional boundaries, it is reasonable to ask whether even our leading academic medical centers and medical schools are structured in a way that will optimize their futures. I indicated to the School leadership that I intend to have a conversation about this issue with them over the next year and that I hoped they would approach this dialogue with open minds and creative vision. Because these questions are so important I want them to include our broader community of faculty, students and staff in the discussions as well.

While asking questions that force us to reconsider our present organization can be threatening, it seems imprudent and even irresponsible not to raise them simply because we might fear that the challenges they pose are too large or disruptive. Indeed, raising challenging questions does not compel an action or a direction *per se*. However, but as stewards of the future, it is essential that we critically evaluate how we can assure that Stanford is a role model for research-intensive schools of medicine for the 21st century.

As I engage in dialogue with school leaders and others, I am quite interested in getting feedback regarding the implications of revising certain aspects of our current model – or any alternates that might come forward – in relation to our primary missions in education, research and patient care. For example, a strength of the current departmental based approach to the clinical training of undergraduate and graduate medical students, as well as residents and fellows, is the opportunity to develop skills in specific disciplines, or to focus on specific organ systems, technologies, procedures, or special patient populations. But science and medicine have become much more interdisciplinary in the last decades, even though much of the training has remained more linear and discipline specific. Indeed, for a school like Stanford, it is important to query how the educational paradigm can be changed and how we can develop students who will emerge with multiple skills and who will be poised to become future leaders and agents of change.

Novel and broad training opportunities should be accessible to students pursuing either an MD and/or a PhD degree. Further, clinical training should not be limited to the acquisition of one skill set when, in fact, many medical and surgical specialties are merging or blending. Certainly opportunities for cross medical training exist presently,

but the need for these to evolve and develop more rapidly is heralded by the innovations that are changing the skills sets of previously discrete specialties or disciplines.

Further, educational opportunities should reach beyond the traditional department/discipline boundaries. PhD students would seem to benefit from more interdisciplinary training programs that provide an alternative to defined departmental offerings, as evidenced by the impact of BioX and the growth of successful interdisciplinary graduate programs at Stanford. To accomplish this might mean developing different ways of educating students within the current organizational structure. However, it could also mean realigning current departments or their functional units around interdisciplinary models. Whatever changes are made should be done to optimize flexibility and with the recognition that there will be further evolutions of current disciplines in the years ahead. The goal should be to allow programs to evolve and change with them, as compared to being bounded by them.

There is no doubt that basic fundamental research focusing on investigator- identified questions has made American science the strongest in the world. Such fundamental investigation should continue to be fostered and supported as the underpinning of our research enterprise at Stanford. At the same time, a number of important aspects of bioscience are becoming more team based and interdisciplinary. They are opening the door to new ways of thinking about how systems (from molecules and cells to organs, tissues and beyond) are organized and how they function. Thus, is not inappropriate to query whether AMCs are organized to be able to conceptualize and address the big health and big science challenges facing the world. These require variegated skills and knowledge – from basic and clinical science, as well as the physical and engineering sciences – to address. Can we currently pose and successfully address the “grand health and bioscience challenges” of the 21st century – and is this in fact what a medical school of an AMC should be doing? Should the teams addressing major issues arise spontaneously or should they be facilitated by new integrations, cross- talk and shared goals? Obviously we have already taken the lead in these new developments through the establishment of our Stanford Institutes of Medicine and, more recently, our Strategic Centers.

Moving from education and research to patient care, I would point out that many of the ways we currently carry out patient care in academic medical centers defy logic and present a confusing maze to patients and families. Clinical services are discrete, autonomous and sometimes redundant within the same medical center. Unfortunately, they do not always address what is needed from the patient’s perspective, especially when medical conditions are complex and require team-based approaches. While the “cancer center” model has provided the most coordination in many AMCs, even these centers depend on the good will and cooperation of various departmentally based disciplines. The question is whether this model of care would be enhanced if in fact all the disciplines shared the same goals and objectives, and, in fact, further translated this alignment to education, training and translational research.

As a relatively small research-intensive school of medicine with a history of innovation and an entrepreneurial spirit, Stanford can serve as role model for appropriate change among AMCs. I have begun to hold discussions on this large and important topic and will continue to do so in the months ahead. I wanted to let you know that these discussions are going on and also to let you know that I will hold Town Hall meetings to give as many people as possible the opportunity to participate in the dialogue. In the interim, if you have comments to offer, please feel free to do so.

Addressing Diversity

Enhancing diversity in the School of Medicine must be one of our highest priorities. While we have made some progress in the past several years, especially in recruiting enormously talented medical and graduate students, we are not performing as well with other trainees (residents/fellows) or with faculty and staff. To help us focus our efforts, a significant portion of this year's Leadership Retreat addressed diversity. We benefited enormously from the broad and deep perspectives of our guests, the well-known actor Anna Deavere Smith, Dr. David Satcher, 16th Surgeon General of the United States, and Dr. Freeman Hrabowski, President of the University of Maryland, Baltimore County. Their contributions, as well as the lively discussion they provoked, are well covered in the February 2nd issue of the Stanford Report (see <http://news-service.stanford.edu/news/2005/february2/med-retreat-020205.html>) and I encourage you to review this report. These are issues that require bold thinking along with a unified and focused commitment to change both now and over a long time horizon.

Stanford University Minority Medical Alliance

On Saturday February 5th, the 14th Annual Premedical Conference sponsored by the Stanford University Minority Medical Alliance (SUMMA) drew more than 500 college and high school minority students seeking to learn more about medical school, including how to apply and make the transition to medical school. These conferences have been enormously successful because of the extraordinary dedication and commitment of our students, who organize, lead and conduct this important event. While all of the students and staff who participated in this event deserve our appreciation, I want to acknowledge the SUMMA Coordinators: Matt Bucknor, SMSII (Student National Medical Association), Heather Fleharty, SMSII (Stanford American Indigenous Medical Students) and Mike Molina, SMSII (Latino Medical Student Association) for their special efforts.

Among the remarkable facets of this conference were presentations by three of our medical students, who reflected on their own lives and on how they each overcame adversity related to race, socioeconomic status or political oppression. Their stories were inspiring. They offered hope and engendered respect. I thank each of them for their honesty and integrity – and am confident that their reflections provided a beacon of hope for all in attendance.

Thanks to the efforts of many faculty, students, and staff, Stanford has continued to be a national leader in the diversity of its medical student classes. This level of success is now

extending to graduate students as well. But we have a long way to go to show similar progress among postgraduate trainees or fellows. We are committed to making that progress. We clearly need to begin with fostering a pathway that provides opportunities for these talented students to continue their training at Stanford and, hopefully, become members of faculties at research-intensive medical schools, including Stanford.

Transition in Cardiothoracic Surgery

On February 1st, the leadership of the department of Cardiothoracic Surgery changed from Dr. Bruce Reitz to Dr. Bobby Robbins. First, I want to thank Dr. Reitz for his dedicated leadership as department chair for the past 12 years. Dr. Reitz is one of the foremost cardiac surgeons in the world. He has played a major role in keeping Stanford at the forefront of education, research and patient care in cardiac surgery. As the Norman E. Shumway Professor, Dr. Reitz has not only provided departmental leadership but has also had a productive clinical and research career. He focused on mechanisms of allograft rejection for the heart and lung as well as the late chronic effects of rejection and its treatment and prevention. In addition to the respect in which Dr. Reitz is held for his remarkable clinical skills he is much admired as an individual of great integrity who leads by quiet example. I want to thank him on behalf of the School and University and wish him well as he begins a much-deserved sabbatical.

I am also enormously pleased that Dr. Bobby Robbins has agreed to become the next chair of the Department. After more than a yearlong national search chaired by Dr. Ron Pearl, Dr. Robbins emerged as the leader in the field and I am deeply gratified that he has accepted this important position. I have had the privilege of working with Dr. Robbins since he assumed leadership of the Stanford Cardiovascular Institute last April. He has proven himself to be a visionary, dedicated and much admired leader. I am quite confident he will play a major role in further developing the cardiothoracic surgical programs. I also anticipate that he will engage in creative and productive alignments with a broad array of colleagues from both the basic and clinical sciences as well as throughout the University. Dr. Robbins has been highly sought after for leadership positions at a number of major academic medical centers across the USA and I am most pleased that he has elected to remain at Stanford. We are fortunate to have him and I look forward to working with him in the years ahead.

Planning an Agenda for Regenerative Medicine

On Monday January 31st a “Working” Retreat on Regenerative Medicine was held in the Clark Center Auditorium. This retreat, organized by Michael Longaker, Chair of the Program Advisory Committee on Regenerative Medicine (PRM) under the auspices of the Cancer/Stem Cell Institute, along with Drs. Linda Giudice and Julie Baker, Co-Chairs of the Human Embryonic Stem Cell/Nuclear Transplantation Operations Subcommittee. The retreat featured an overview of the Institute by Dr. Irv Weissman and the PRM Subcommittees on Education (Dr. Minx Fuller), Research (Dr. Roel Nusse), Bioethics (Dr. David Magnus), Facilities (Dr. Michael Longaker) and Human Embryonic Stem Cell

Operations (Drs. Linda Giudice and Julie Baker) (see additional background details in the January 10th Dean's Newsletter: http://deansnewsletter.stanford.edu/archive/01_10_05.html#2).

Because there are so many legal, regulatory and political issues surrounding the burgeoning field of human embryonic stem cell research I asked Dr. Ann James, Office of the General Counsel, to offer a summary of the presentation she delivered at the Retreat. I would encourage anyone interested in human stem cells or who is considering working in this area to read Dr. James' thoughtful summary which follows below:

Human embryonic stem cell (hESC) research would likely be only another, albeit exciting and promising, avenue for research, were it not for the dramatic step taken by President Bush on August 9, 2001. In his presidential directive, Mr. Bush made a political determination on a scientific avenue of research, and strictly defined the stem cell research that can be funded by federal funds. Federal policy, as defined by Presidential order, is: "No federal funds will be used for: (1) the derivation or use of stem cell lines derived from newly destroyed embryos; (2) the creation of any human embryos for research purposes; or (3) the cloning of human embryos for any purpose. Today's decision relates only to the use of federal funds for research on existing stem cell lines derived in accordance with the criteria set forth above."

The hESC lines then derived were relatively few, fewer than the Administration had announced, and were all grown on murine feeder cells, offering the possibility (now established) that all could be infected with animal viruses. The scientific community, along with the families of those for whom stem cell research offered the possibility of therapies and even cures, aligned in California to produce Proposition 71, providing 3 billion dollars for research in this area. The purpose of this initiative is to fund research to "develop life-saving regenerative medical treatments and cures", placing the focus on translational medicine.

As Proposition 71 became law, the scientific community in its various academic homes began to consider what the federal ban on funding for research on "non-approved" hESC lines would mean. California, by statute, permits such research, and provides relatively few statutory requirements. However, the ban on direct and indirect use of funds requires a "clear policy" for investigators, as the NIH has indicated.

NIH has provided some guidance on how to handle such costs, and there is precedent for such allocation. Privately funded research such as that done by Howard Hughes Medical Institute fellows is carved out from the University's indirect cost calculations, and the equipment and supplies funded separately, so this process is not new for Stanford. OMB Circular A-21, Cost Allocation Standards, is the principal guidance for calculation of indirect costs.

The NIH provides answers to some, but far from all, frequently asked questions (FAQs) on its web site (<http://stemcells.nih.gov>). Strict compliance with A-21 is required. For example, there is no requirement that hESC research or research costs be physically segregated if cost allocations are appropriate. As the FAQs remind us: “If direct costs of ineligible hESC line research are properly allocated and negotiated, and negotiated F&A rates properly applied, then the F&A costs of hESC research will be deemed to have been allocated properly, and no federal F&A funds will be deemed to have supported such research.”

An NIH-funded investigator also may be engaged in ineligible hESC line research “so long as his or her salary is allocated between the two activities in accord with his or her effort.” This places even greater focus on the importance of allocation of effort, and the proper documentation of any reallocation required when beginning research in such research.

To assure that these requirements are met, Stanford is developing a policy that will address four key areas: tracking all such research done at Stanford, special training for anyone doing work with stem cells, special operating procedures, and compliance. To assure that such research is done, as California requires, with “full consideration of ethical and medical implications”, a special research panel will be charged with such oversight. This policy, as approved by the Deans of Medicine and Research and reviewed by key faculty members, will be presented to the Committee on Research on February 16, and then be processed through approval by the Senate of the Academic Council. In addition to the adoption of this policy, detailed procedures will be developed to provide more concrete guidance for investigators, likely supplemented by our own set of FAQs to address specific questions and give more guidance as the interpretation of the ban is better understood.

Our goal is to collaborate with other institutions, both in California and across the county, to share, as much as possible, our analysis of the requirements for proper management of such research. NIH is now reviewing its guidance in response to specific questions received as the focus on hESC work has increased. However, such guidance is unlikely to be provided for some time, given that the Department of Health and Human Services has a new Secretary, who has strong views on such research and will likely become involved in any guidance issued.

Counsel and advice is available. Questions can be directed to a variety of knowledgeable faculty and staff at Stanford: for scientific issues, Linda Giudice, Julie Baker, Roel Nusse, Michael Longaker, and Irv Weissman; for overall issues under the University policy, Ann Arvin, Assistant Dean of Research; for legal questions, Ann N. James in the Office of General Counsel. None of these individuals will have all the answers, but are committed to assisting the Stanford community by finding answers. General information will be provided through a web site, and updated as more questions are asked and answered. The critical requirement is to ask the questions, not hope for forgiveness for errors; in return,

Stanford is committed to responding to its scientific community as quickly and effectively as possible in this time of uncertainty.

While we can take the position that management of hESC under the ban is a cost issue, it has far greater implications for adverse publicity, investigation, and even effect on the Proposition 71 funding opportunity. There is no room for error.

Proposition 71 itself effectively creates an organization intended to respond to the purposes of funding otherwise unfunded research and to seek both therapies and cures. The Independent Citizens' Oversight Committee (ICOC) governs the California Institute for Regenerative Medicine (CIRM). This 29 member body was appointed by the Governor, other designated State officers, and by the Chancellors of the UC System. The statute was guided by the goal of funding great science, but written with a keen political sensitivity to the fact that the citizens of California are entrusting this body with oversight of three billion dollars in public money, and accountability is high.

The ICOC includes the designees/appointees from academic medical and research institutions, from one life science commercial institute, and from ten advocacy groups. Both the chair and vice-chair, chosen from among the ICOC members, were required to have had experience with stem cell research advocacy. A staff and a President, for which position the ICOC is now recruiting, will manage the day-to-day operations of the CIRM.

The ICOC is subject to the Bagley-Keene Act, California's open meeting act, to assure transparency in decision-making. All the usual functions of a board of directors are assigned to the ICOC, which will report at least annually to the State on its work in a prescribed format. The ICOC will oversee operations, set plans for research and management of financial issues, determine research standards and grant awards, name working groups and set guidelines, request issuance of bonds and borrow from the Pooled Money Investment Board. Conflict of interest issues must be resolved or managed under the direction given by the statute. The ICOC will determine how intellectual property is to be handled, based on the statutory requirement to balance the State's interest in sharing in revenues that might come from such research with the need to avoid hindering essential medical research. This required balancing will likely result in an arrangement similar to that now in place between academic medical centers and the VA system, but there is no determination on this issue yet.

The Medical and Scientific Accountability Standards defined by the Statute address such issues as informed consent, payments (no compensation for donors, but expenses can be covered), patient privacy, and a time limit on what cells can be used (8 to 12 days, excluding time frozen). Such standards will be expanded by the ICOC, as guided by the recommendations of its working group on accountability. Central to the ICOC's role is appointment of the three Scientific

and Medical Working Groups. These include Research Funding, Accountability Standards and Research Facilities.

The conflict of interest standards for the groups will be based on those for NIH scientific review committees, and overseen by an ethics officer from the ICOC. The working groups are not public officials and not subject to open meetings/records requirements, but recommendations to the ICOC are subject to the open records requirement. A group will report to the ICOC if a majority of a quorum approve, but also may issue a minority report if 35% of the members so choose.

The accountability standards group will recommend scientific, medical and ethical standards, and advise all other Groups on ethical and regulatory issues. This group will have 19 members, of which 5 will be ICOC members from advocacy groups, 9 will be nationally recognized stem cell scientists/clinicians, 4 medical ethicists, and the ICOC chair.

The research funding group will have 23 members, of which 7 will be ICOC members from advocacy groups, 15 will be scientists nationally recognized in stem cell research, and the Chair of the ICOC. This group will recommend criteria, standards, and requirements for funding applications and awarding grants. The group will also recommend awards for research, therapy development, and clinical trial grants and loans, as well as set the standards for evaluation of grantees, and conduct peer group progress oversight reviews of grantees. The 15 scientists will score for scientific merit, using such criteria as the quality of the proposal, potential for significant results, timetable, importance of objectives and innovativeness of research. While the group and the ICOC will give high priority to research not otherwise funded, research that represents a vital research opportunity may be funded if 2/3 of a quorum recommends approval. The questions on what will be funded, when and in what format are not yet answered (and neither this or other groups have yet been appointed).

The facilities group will have 11 members, including the Chair of the ICOC, 6 members of the funding group, and 4 real estate specialists. This group will recommend criteria, requirements and standards for funding of facilities. Milestones and timetables must be established, and priority will be given to those that can be completed in two years. Renovation as well as new construction may be funded. Only non-profit organizations can apply for facilities funding. Matching funds (at least 20% of the award) are required, and there will be priority for those applications that have higher matching fund amounts.

Proposition 71 created the ICOC with the purpose of finding therapies and cures, of understanding hESC capabilities as a primary focus (since this research cannot be funded through any federal program), but, as the name suggests, is intended to focus effort and scientific talent on regenerative medicine. The Stanford Program

on Regenerative Medicine serves as the locus for this research at Stanford, to provide information, to encourage collaboration, and to assist the University to give clear direction for conduct of hESC research to its community through policies and procedures.

I want to thank Dr. James for her contribution as well as all who organized and participated in the retreat. It was highly informative. A subsequent retreat will be planned to highlight scientific accomplishments and opportunities, and I will let you know further details about this as they become available.

Conflict of Interest Reporting

You likely know that over the past weeks the NIH Director's decision to ban virtually all industry related or sponsored outside activities for NIH employees has attracted wide attention. A number of factors contributed to this severe restriction, including the failure of some individuals to disclose potential conflicts of interest. At Stanford we have clear policies governing conflict of interest (see recent update in the January 24th Dean's Newsletter: <http://deansnewsletter.stanford.edu/>). In the next couple of weeks all faculty will be asked to complete their annual disclosure – which is mandatory. Please attend to this as soon as it arrives. Failure to comply will have serious consequences. If you have any questions please check with Barbara Flynn, Manager of the Conflict of Interest Review Program (barbara.flynn@stanford.edu). Thank you in advance for your cooperation.

Upcoming Research Opportunities for Residents and Fellows

At the February 4th meeting of the Executive Committee, Dr. Harry Greenberg, Senior Associate Dean for Research, Graduate Education and Postdoctoral Affairs and Dr. Sam Gambhir, Professor of Radiology, presented the current planning to institute a program in which a selected number of residents and fellows would, in addition to completing their clinical programs, also complete a doctoral degree in a basic science discipline. The model for this program is the Specialty Training and Advanced Research program at UCLA.

The motivation for developing this type of program is that new strategies are needed at Stanford for better linking residency/fellowship training programs with basic science and translational research. Further, residents and fellows may benefit tremendously from having sustained research experiences while completing their clinical training, including the ability to get a Ph.D. Issues that would need to be resolved include funding sources for such a program, tuition issues at Stanford, and the establishment of links beyond the School of Medicine.

The Executive Committee was enthusiastic about pursuing the development of such a program. We will keep you apprised of further progress. In the meantime, if you have comments or suggestions about this idea, please be in touch with Dr. Greenberg at Harry.Greenberg@stanford.edu.

Electronic Health Records

On Friday February 4th Dr. David Brailer, National Coordinator for Health Information Technology, US Department of Health and Human Services, gave the inaugural lecture for the Center for Clinical Informatics Seminar Series on the topic “Towards a National Model of the Electronic Health Record”. In addition to presenting a thoughtful overview of this topic, Dr. Brailer had an engaging conversation with interested members of the Stanford community. The video of Dr. Brailer’s lecture is available at: http://clinicalinformatics.stanford.edu/scci_seminars/02_04_05.html

2005 Health Care Symposium

On Wednesday January 26th, students from the School of Medicine and the Graduate School of Business collaborated on the 2005 Stanford Health Care Symposium entitled “Five by Twenty: Five Ideas That Will Revolutionize Health Care by 2020.” The Symposium featured a number of exciting plenary addresses and panels. I had the opportunity to chair an interesting panel entitled “Better, Faster, Cheaper? Process Innovation in Drug Design and Development”. This was an impressive event and I want to acknowledge the important role that Farzad Soleimani, SMSII played in its organization and coordination.

Stanford Medicine Focuses on the Nation’s Health Care System

The Winter 2005 issue of Stanford Medicine is hot off the presses and on-line at <http://mednews.stanford.edu/stanmed/2005winter/>. This issue has a special focus on “*The Nation’s Health Care System: A Ticking Time Bomb?*” It provides a thoughtful overview of the current status and challenges of our health care system and offers valuable perspectives from Jan Van Lohuizen, the President’s pollster, and by Dr. Mark McClellan, chief administrator of Medicare/Medicaid. It is an issue definitely worth reading. I want to offer my compliments and appreciation to the editorial board of Stanford Medicine and to its editor Roseanne Spector. Thanks also to the leadership of Paul Costello, Executive Director of Communications and Public Affairs.

Living Better, Living Longer

As part of our ongoing educational programs for the community, an evening session entitled “Living Longer, Living Better” was held on Monday January 24th in the Arrillaga Alumni Center. This informative seminar included a panel discussion on longevity that featured Drs. Laura Carstensen, Tom Rando, Bill Mobley and Peter Pompey. In addition small group discussions were held on a number of interesting topics, including:

<i>Incontinence/Sexuality</i>	Dr Bertha Chen, Assistant Professor of Obstetrics/Gynecology
<i>Managing Chronic Pain</i>	Dr. Sean Mackey, Assistant Professor of Anesthesia
<i>Vision and the Aging Eye</i>	Dr. Mark Blumenkranz, Professor and Chair of Ophthalmology

<i>Memory Loss and Again</i>	Dr. Jerry Yesavage, Director, Alzheimer's Disease Center
<i>Preserving Cognition/Mental Health</i>	Dr. Barbara Sommer, Director, Stanford Geriatric Psychiatry Program
<i>Joint Replacement</i>	Dr. Stuart Goodman, Professor of Orthopedic Surgery

I want to thank the speakers and organizer for this very successful program.

Community Lecture Series Addresses Skin Cancer and Other Disorders

On Wednesday evening February 2nd, our community lecture series focused on skin diseases – from basic science to clinical problems including melanomas, non-melanoma skin cancers to wrinkling and aging. I want to thank our three speakers (Drs. Hayes Gladestone, Tony Oro, and Susan Swetter) for their excellent presentations and for the time they spent lecturing and answering questions raised by community guests.

Awards and Honors

- ***Sarah S. Donaldson***, Catharine and Howard Avery Professor of Radiation Oncology received the Elizabeth Blackwell Award from the American Medical Women's Association (AMWA), at their 2005 annual meeting in Washington DC. This award memorializes Elizabeth Blackwell, the first woman to earn a doctor of medicine degree. The Blackwell medal is the AMWA's highest award identifying a female physician who has made an outstanding contribution to the cause of women in medicine. In receiving this award, Dr. Donaldson is recognized for her numerous accomplishments as a physician, researcher, and author, demonstrating exceptional achievements and commitment to medicine. Congratulations to Dr. Donaldson.
- ***Dr. Willard Fee*** was honored by faculty, alumni and friends of the department of Head & Neck Surgery on Tuesday January 25th by the dedicated the Department's Library to him. Dr. Fee has had a highly respected career on the faculty of Stanford and played a major role in shaping the current department and numerous trainees. Dr. Michael Johns, Executive Vice President for Health Affairs and Director of the Robert W. Woodruff Health Sciences Center, offered serious as well as humorous reflections of Dr. Fee's remarkable career based on their long personal and professional relationship. Congratulations to Dr. Fee.

Dr. Lucy Shapiro, Virginia and D. K. Ludwig Professor and Senior Fellow, by courtesy, at the Stanford Institute for International Studies and Director of the Beckman Center, has been named the 2005 recipient of the National Academy of Science's Selman A. Waksman Award in Microbiology "*for her pioneering work revealing the bacterial cell as an integrated system with transcriptional circuitry interwoven with the 3-D deployment of regulatory and morphological proteins*". Of note, Dr. Shapiro is the first

woman scientist to receive this award since it was first given in 1968. One might say that it is about time! Congratulations to Dr. Shapiro for another wonderful honor.

Appointments and Promotions

- **Jeffrey Axelrod** has been appointed Associate Professor of Pathology, effective 2/01/2005.
- **Jeffrey Glenn** has been reappointed Assistant Professor of Medicine (Gastroenterology), effective 9/01/2005.
- **Miriam Goodman** has been reappointed to Assistant Professor of Molecular and Cellular Physiology, effective 2/01/2005.
- **Albert Koong** has been reappointed to Assistant Professor of Radiation Oncology, effective 9/01/2005.
- **Philip Lavori** has been appointed Professor of Health Research and Policy, effective 2/01/2005.

Dean's Newsletter February 22, 2005

The Matter of Funds Flow

I have previously described some of the challenges involved in the frequently contentious matter of funds flow between hospitals and schools of medicine, both here at Stanford and at other academic medical centers.

(http://deansnewsletter.stanford.edu/archive/04_14_03.html#5). I have also described how we have attempted to deal with this issue. Most of the solutions, at least during my tenure, have been modifications and compromises, and they have often been short-lived. For that reason Martha Marsh, CEO of Stanford Hospital and Clinics, and I determined that it was in our mutual interest to overhaul the “matter of funds flow” more dramatically. We charged a small working group to help accomplish this in time for the FY06 fiscal year. The Funds Flow Working Group has included Dr. Norman Rizk, Senior Associate Dean for Clinical Affairs, Dr. Gerald Shefren, Vice President for Ambulatory Care), Michael Hindery, Senior Associate Dean for Finance and Administration, David Kiehn Vice President for Financial Operations, Marcia Cohen Assistant Dean for Fiscal Affairs, and Dr. Robert Jackler, Professor and Chair of Head & Neck Surgery.

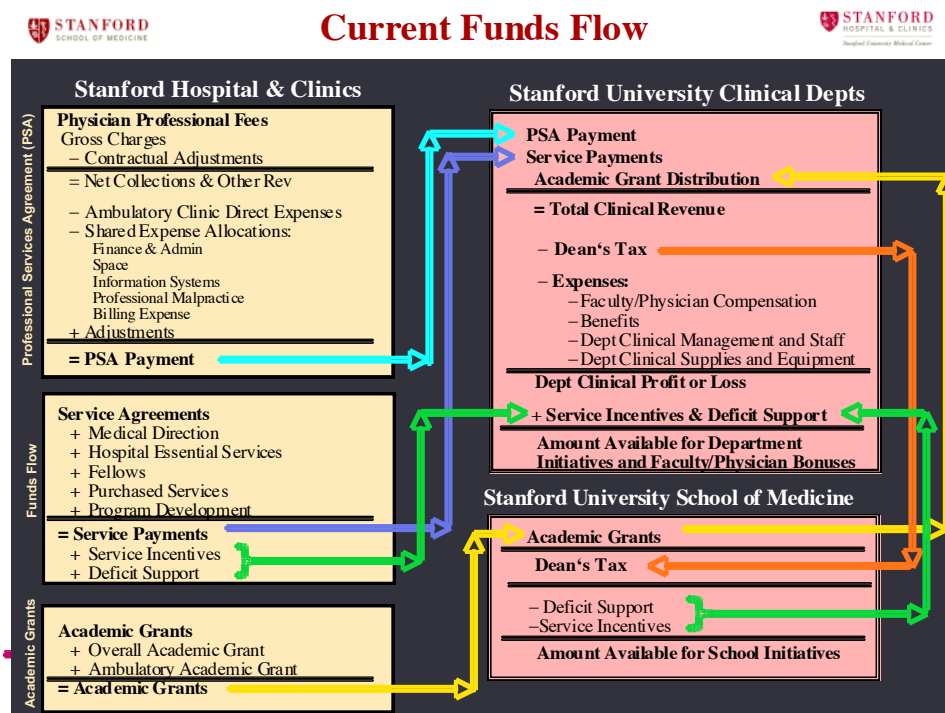

The Funds Flow Working Group commenced in September 2004 and has spent an extraordinary number of hours testing concepts, options, models and proposals. The group has operated with wonderful collegiality and cooperation, and has now developed a model that is being intensively refined so that it can be optimized and so that its potential pitfalls can be understood. To benefit from additional input and perspectives, the original working group was augmented by four department chairs (Drs. Tom Krummel (Surgery), Al Lane (Dermatology), Bill Maloney (Orthopedics) and Ron Pearl (Anesthesiology)) in January 2005. The group has also had the opportunity to present their work-in-progress proposal for a new funds flow model to the Joint Planning Committee (a group of School

and SHC senior leaders and managers), the SHC Board of Directors Finance Committee, the Council of Clinical Chairs, and Department Finance Administrators of the clinical departments. While everyone who has participated recognizes that considerable work remains to be done, virtually all have praised what has been accomplished to date and have strongly endorsed the completion of this important project for FY06, which begins September 1, 2005.

The Funds Flow Work Group began with a bold goal -- “to reinvent the funds flow to better align SHC and the School of Medicine into a more integrated and functional relationship.” In doing so, the group defined the components that comprise the current funds flow between SHC and SoM. In FY 04 these included:

1. The Professional Services Agreement (or PSA), which includes collections from billings net of direct operating expenses and allocated “shared expenses.” For FY04 this totaled approximately \$90M.
2. Other payments for services rendered (approximately \$27M in FY04). These included:
 - a. Medical direction
 - b. Essential services
 - c. Program development
 - d. Reimbursement for School of Medicine clinical staff for services provided to SHC
3. Service incentives and support for clinical practice deficits (\$3.5M in FY04)
4. “Grants,” which amounted to approximately \$13M in FY04.

Marcia Cohen developed the following schematic of the current funds flow schedule:

This schematic illustrates why a dramatic change in the funds flow model is needed. In group practices that operate their own ancillaries (such as PAMF), the ancillary revenues, which may account for as much as 45% of the practice revenue, are a major component of the funds available for physician compensation. The structure of the Stanford faculty does not allow for the ancillary revenues to supplement the professional revenues. Without a major realignment, the professional revenue (or PSA) cannot support the practice expenses and compensation for clinicians that reflects that real market values. For these and other reasons, the current funds flow model does not incentivize the growth of clinical services. In fact it has almost the opposite effect. Departments attempt to make favorable arrangements with the hospital in order to make up for the deficits inherent in the current PSA. This has the consequence of creating tensions between departments, the School and hospital. Although the end-of-the-year grant has been a way to address some of these problems, it has inherent unpredictability and, at the end of the day, does not foster a more productivity based model or one that includes innovation and quality.

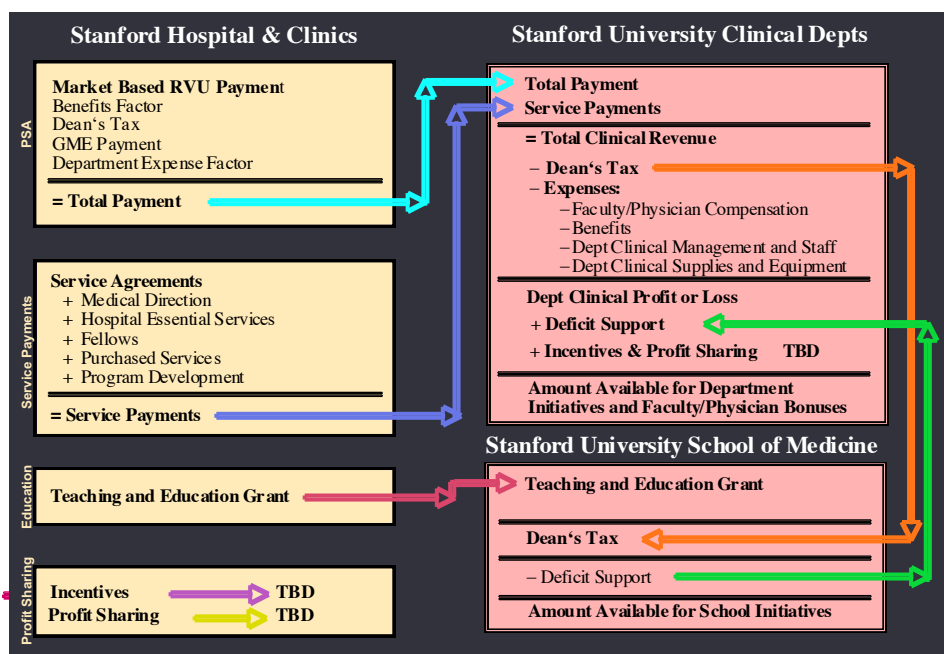

Accordingly, the Work Group concurred that a new funds flow model should:

- ♣ Align incentives, be simple, formula driven, stable, predictable and transparent
- ♣ Be inclusive of medical direction, essential services, program development, graduate medical education, profit sharing, and mission based funding
- ♣ Support productivity and market-based compensation for physicians
- ♣ Support financial sustainability for both SHC and the School of Medicine

Based on these guiding principles, a new funds flow methodology has been developed that utilizes an RVU payment-based methodology and that better codifies the responsibility for allocated expenses, particularly in the ambulatory clinics. In the new model, SHC would operate the inpatient and outpatient facilities, manage the revenue cycle, and pay the School (and hence faculty) for the professional services being delivered. In this methodology, payment would be based on US private practice compensation by specialty and clinical service according to the RVU schedule from the MGMA (define) database. Although academic practice RVUs are available, the Working Group concluded that they were too confounded and that the private practice RVUs better reflected a compensation level that reflects fair market value.

In the new methodology, the RVU payments would replace the previous PSA model and would also include all expenses, including benefits, departmental overhead, graduate medical education and the Dean's tax. In this new methodology, the payments for defined clinical services (e.g., medical direction, program development, essential service) would still exist but would almost certainly be less. An appropriate gain-sharing methodology will be developed. And, importantly, a grant for education and training would appropriately recognize these as important missions for the medical center.

Using the same graphic format shown above for the current model, the new funds flow model would be as follows:

There are a number of perceived benefits to the new RVU based methodology, including especially the fact that this payment schedule is based more on clinical productivity than ad hoc negotiated “special deals” between clinical chairs, faculty and hospital leaders. Further, it better aligns the incentives of the hospital and faculty physicians, provides better financial predictability and stability, and improves the prospect for outpatient practices to achieve financial viability. Importantly, because this methodology helps to standardize funds flow, it will help facilitate the success of service lines, centers and the Institutes, including programs between and among different departments. In addition, this new funds flow model provides funding for clinical administrative overhead and also allocates support for teaching and education missions.

While there has been considerable interest and enthusiasm for this new model from the Working Group and the various faculty and hospital groups that have heard about it, it must be noted that a similar model is not currently being used in an academic medical center, although similar methodologies are employed in other practice settings. Moreover, there are many details to be worked out and a number of issues that require further study, including legal review and assurance of compliance with all applicable laws and regulations. That said, the goal is to refine the fundamental components of the model by the end of April so that it can be employed in the budget planning for FY06. To accomplish this goal, however, and to resolve the understandable uncertainties that still exist, a 2-3 year transition plan will be configured. This plan will avoid major immediate dislocations and permit appropriate accommodations while guarding against “special deals” that would render the new model suspect or useless.

Overall, I am very encouraged by the progress to date but I am also cognizant of the work that remains to be done in the weeks ahead. I must again thank the Working Group,

including its expanded membership, for the tremendous work they have done, and, equally, for the very cooperative manner in which they have worked to assure the integrity and well being of both SHC and the School of Medicine. Indeed, the proposed funds flow model signals a major change by paying faculty for productivity and by simplifying what has been a confusing and often contentious process. Among the most important consequences of the new funds flow model is that it will permit us to achieve more fully our integrated clinical plan with SHC while limiting the wasted time and effort that has so confounded the matter of funds flow. I truly believe we now have hope for the future.

Evolving Issues Regarding Conflict of Interest

I have had several recent communications with you about Conflict of Interest matters (http://deansnewsletter.stanford.edu/archive/01_24_05.html and http://deansnewsletter.stanford.edu/archive/02_07_05.html). In that same time period, news articles have continued to appear. These have mostly been about the specific problems that emerged at NIH and the resultant one-year ban on the ability of NIH employees to perform any compensated consulting with industry. However, several more recent articles and editorials (e.g., LA Times, Washington Post) have promulgated the view that similar limitations should apply to NIH funded investigators at academic medical centers. As recently as Saturday February 12th, NIH Director Elias Zerhouni was cited as pondering the merits of a “summit” to examine this matter more fully.

There are of course very significant differences between NIH employees, who are truly carrying out their work as public servants, and faculty or investigators, who are doing research at medical schools, universities or research institutes. Of course they share in common the fact that, irrespective of the place of work or method of compensation, the rules and regulations surrounding the management of potential conflicts of interest must be closely adhered to, fully reported, and, where necessary, managed. The Stanford policies regarding conflict of interest can be found at (<http://med.stanford.edu/conflict>).

I had the opportunity to review the NIIH events and their potential impact on academic medical centers at the Council of Deans Board meeting on Thursday February 17th. There was common agreement among the deans that we all need to adhere to our institutional conflict of interest policies but that we also want to continue to promote appropriate interactions with industry as stimulated by the Bayh-Dole Act. In addition, we all recognized the importance of keeping our faculties fully informed about this important topic. Accordingly, upon my return to Stanford on February 18th, we had another discussion about conflict of interest at the Executive Committee meeting. At this meeting I underscored the need for school leaders to be informed and engaged in overseeing their faculty on conflict of interest matters. To further help educate and inform faculty, Dr. Harry Greenberg, Senior Associate Dean for Research, Graduate Education, and Postdoctoral Affairs, along with Ms. Barbara Flynn, Manager of the Conflict of Interest Review Program, Ann Arvin, Associate Dean for Research, and the School’s Conflict of Interest Committee have prepared a very helpful fact sheet on this topic. This fact sheet as well as other points of interest will be available on the website

(<http://med.stanford.edu/conflict/tips.html>). I am also taking the liberty of posting the fact sheet here. I strongly encourage you to read it carefully.

TIPS FOR MANAGING YOUR OUTSIDE PROFESSIONAL RELATIONSHIPS IN ORDER TO AVOID CONFLICTS OF COMMITMENT AND INTEREST

Stanford faculty members owe their primary professional allegiance to the University, and their primary commitment of time and intellectual energies should be to the education, research, and scholarship programs of the institution. Outside professional relationships, can result in conflicts regarding time and energies which represent conflicts of commitment. In addition, these activities can result in conflicts of interest when there is a divergence between an individual's private interests and his or her University obligations such that an independent observer might reasonably question whether the individual's professional actions or decisions are determined by considerations of personal gain, financial or otherwise. A conflict of interest depends on the situation, and not on the character or actions of the individual.

Faculty members should conduct their affairs so as to avoid conflicts of commitment and avoid or minimize conflicts of interest, and must respond appropriately when conflicts of interest arise. Disclosure of such interests is required under University, as well as School of Medicine policy. The complete set of University policies concerning conflicts of interest and commitment and related areas can be found at the following web sites:

<http://www.stanford.edu/dept/DoR/rph/Chpt4.html>
<http://www.stanford.edu/dept/DoR/rph/4-3.html>
<http://med.stanford.edu/rmg/conflict.html>

These tips are meant to serve as a brief guide to faculty about issues that need to be considered when engaging in outside professional activities.

If you CONSULT for a company

- Your primary commitment is to the University and your consulting agreement should not conflict with that obligation or conflict with any other university rules or regulations.
- You need to ensure that your consulting agreement recognizes that title to all potentially patentable inventions conceived, or first reduced to practice, in whole or in part, in the course of your University responsibilities, or with more than incidental use of University resources, must be assigned to the University. This means that your consulting agreement does not grant the company access to any ideas that do not arise as a result of your consulting activities or would be deemed an extension of your University activities.

- You must not provide the company with early or exclusive access to results of your Stanford research, unless those results come from a sponsored research project with the company.
- Your consulting activities need to be as separate from your research as possible, so that these activities are not seen as an extension of your sponsored research at Stanford.
- Your consulting agreement must not delay or prohibit publications resulting from your Stanford research.
- The scope of your consulting responsibilities needs to be very specific so that it does not grant the company access to work not done under the consulting agreement or interfere with intellectual property disclosure, or publications resulting from your academic work.
- Remember that your consulting agreement is a legal agreement drawn up by the company's lawyers. Who is your advocate? You may wish to have your attorney review any legal agreements you sign.
- It might be helpful for you to provide the company with a copy of the Patent and Copyright Agreement for Stanford Personnel
<http://www.stanford.edu/dept/DoR/rph/su18.html>
- You must disclose this relationship with the company in publications and public discussions of any of your research that is sponsored by the company or related to the company.

If you serve on a SCIENTIFIC OR MEDICAL ADVISORY BOARD

- You are permitted to sit on scientific or medical advisory boards because such positions do not carry, nor are they perceived to carry, management responsibility. However, your primary commitment is to the University and your service on a Scientific or Medical Advisory Board should not conflict with that obligation or conflict with any other university rules or regulations.
- You can serve on a Scientific Advisory Board (SAB) or Medical Advisory Board (MAB), however it is advisable to have a formal consulting agreement in those situations. (see CONSULT)
- Often service on an advisory board is rewarded with stock or stock options—such equity can raise the issue of such incentives compromising objectivity, particularly where human subjects are involved in studies of the company's products.
- You must not provide the company with early or exclusive access to the results of your research, unless those results come from a sponsored research project with the company.
- You must keep your financial interests arising from service on advisory boards separate from your research and University obligations in order to:
 - * protect your students, trainees, and others whom you are responsible for directing, from undue influences or the compromise of academic freedoms;
 - * preserve the integrity of the research;
 - * cause no harm to human subjects used in your research; and

- * see that any creations or discoveries that arise during the course of your research or scholarly activities at Stanford are not pipelined to the company, and are disclosed in a timely fashion to the Office of Technology Licensing; and
- * not allow your relationship to compromise the free exchange of ideas or delay or prohibit publications arising from your University activities.
- You must disclose this relationship in publications and public discussion of any of your research that is sponsored by the company or related to the company.

If you serve on a BOARD OF DIRECTORS

- Service on a board of directors carries with it legal fiduciary responsibility but generally not line management responsibility (which is prohibited under Stanford policy) and hence, is generally permissible. However, your primary commitment is to the University and your service on a Board of Directors should not conflict with that obligation or conflict with any other university rules or regulations.
- You are not allowed to serve in various ‘director’ roles in a company, for example, Director of Research, Chief Scientific Officer, Director of Clinical Labs, and the like. Such titles imply management responsibilities and are perceived as such, irrespective of actual job description.
- If you are also the principal investigator of a research project you have fiduciary responsibility for the grant or contract. If you have fiduciary responsibility as the Principal Investigator (PI) on Stanford research and have fiduciary responsibility as a Member of the Board—how do you plan to separate these two obligations?
- Your relationship to the company should not interfere with your primary obligations as a faculty member or University employee.
- You must avoid any conflict of commitment between your University responsibilities and your relationship with a company.
- You must keep your financial interests as separate from your research and University obligations in order to:
 - * protect your students, trainees, and others whom you are responsible for directing from undue influences or the compromise of academic freedoms;
 - * preserve the integrity of the research;
 - * cause no harm to human subjects used in your research; and
 - * see that any creations or discoveries that arise during the course of your research or scholarly activities are not pipelined to the company, and are disclosed in a timely fashion to the Office of Technology Licensing.
- If you also have a formal consulting agreement, see CONSULT.
- You must disclose this relationship in publications and public discussions of any of your research that is sponsored by the company or related to the company.

If you have STOCK OR STOCK OPTIONS in a company whose interests are related to your research, and/or you consult for the company

- Pay attention to what the value of the stock or stock options are so that you report this accurately on your Annual Conflict of Interest and Commitment Disclosure and on any ad hoc or transactional disclosures you make.
- Equity can raise the issue of such incentives compromising objectivity, particularly where human subjects are involved.
 - * if you are conducting, or planning to conduct, a clinical trial, do you really want to accept stock or stock options from the company sponsoring the trial, as you will likely be prohibited from participation in all or part of the research?
- The more significant the equity is financially, or the more likely the research may benefit the company (and thus your equity—particularly in the case of stock options), the greater the risk of biasing the research or research results.
- You must disclose this financial interest in publications and public discussions of any of your research that is sponsored by the company or related to the company.

If you have a LICENSING ARRANGEMENT with the company through the Stanford Office of Technology Licensing

- As a University employee title to all potentially patentable inventions conceived, or first reduced to practice, in whole or in part, by you in the course of your University responsibilities, or with more than incidental use of University resources, must be assigned to the University.
<http://www.stanford.edu/dept/DoR/rph/Chpt5.html>
- The University must avoid conflicts of interest in licensing technology to a company in which the inventor has a financial interest, thus it is in everyone's best interest if the inventor maintains a cordial and willing attitude in working with whatever company ends up licensing the technology or discovery. Faculty may help the Office of Technology Licensing (OTL) to evaluate potential licensees, but the selection of the licensee rests with OTL.
- New developments relating to this intellectual property must also be fairly licensed and you must not pipeline or funnel intellectual property to a company in which you have a financial or founding interest.
- Is the company licensing your technology sponsoring further research in the area of the intellectual property?
- Do you have PHS or NSF funds for research related to this intellectual property? The results of this research or creations or discoveries arising from this research must not be pipelined or funneled to the company that has a license.
- You must disclose this financial interest in publications and public discussions of any of your research that is sponsored by the company or related to the company.

If you are a FOUNDER of a company

- It is assumed that you have both an intellectual and financial commitment to the company, however, your primary commitment is to the University and your

commitment to the company should not conflict with that obligation or conflict with any other university rules or regulations.

- You cannot serve in a management capacity for the company while a Stanford employee.
- You must not provide the company with early or exclusive access to the results of your research, unless those results come from a sponsored research project with the company.
- Your relationship to the company should not interfere with your primary obligations as a faculty member or University employee or conflict with any other university rules or regulations.
- You must keep your financial interests separate from your research and University obligations in order to:
 - * protect your students, trainees, and others whom you are responsible for directing, from undue influences or the compromise of academic freedoms;
 - * preserve the integrity of the research;
 - * cause no harm to human subjects used in your research; and
 - * see that any creations or discoveries that arise during the course of your research or scholarly activities are not pipelined to the company, and are disclosed in a timely fashion to the Office of Technology Licensing; and
 - * not allow your relationship to compromise the free exchange of ideas or delay or prohibit publications arising from your University activities.
- You must disclose this relationship in publications and public discussions of any of your research that is sponsored by the company or related to the company.

If you have a LOAN with the company

- Indebtedness from a loan might compromise or be perceived as compromising your objectivity.
- You must disclose this relationship in publications and public discussions of any of your research that is sponsored by the company or related to the company.

If you give TALKS for the company

- Don't become a spokesperson for the company or its product.
- Honoraria can be used as incentives and incentives can compromise objectivity.
- Keep your talks fair and balanced, i.e. don't just talk about a company's product.
- If you are paid to give a talk, you need to disclose this to the audience during your talk, as well as disclose this in publications and public discussions of any of your research that is sponsored by the company or related to the company.

HOW DO WE ASSESS CONFLICTS OF INTEREST?

One way to personally assess your own conflict of interest is to ask yourself 'how would this look on the 6:00 news'. We often call that the 'smell test'. While you

might not consider your relationship with, or financial interest in, a company to pose a risk to the objectivity of the design, conduct or reporting of your research, it can create that perception. Perception of bias, or the perception that harm came to a human subject in research as a result of bias, can be just as damaging as actual bias or harm. Thus, we must, and you should, ask the following questions:

- Are basic academic values upheld?
 - * an open academic environment is maintained.
 - * there are no restrictions on publications or dissemination of research results.
 - * fair licensing practices are ensured.
 - * the use of University resources and facilities is appropriate.
- * students are not exploited for the private gain of their mentors, and they are free to choose and pursue research
 - * the research is appropriate to the mission of the University.
- What is the scientific direction of the University research and what is the scientific or business direction of the company? Is it the same? Where does it overlap?
- Could these personal financial interests have a direct and significant affect on the research?
 - * how much income or equity is involved?
 - * from how many sources does it derive?
- * could these financial interests be a significant incentive for the individual with the conflict?
- * could this financial interest pose a direct conflict with the research?
- * could this conflict compromise the objectivity of the research results or their evaluation and presentation?
- Could human subjects involved in the research be harmed by the conflict?
- Could potential incentives to show that products are effective affect future patients negatively if the products are actually not as effective as indicated in the clinical study?

HOW DO WE MANAGE SIGNIFICANT CONFLICTS OF INTEREST?

All financial interests or relationships related to your research must be disclosed in accordance with University and/or School policy. PLEASE NOTE THAT THE SCHOOL OF MEDICINE REQUIRES DISCLOSURE OF ANY FINANCIAL INTEREST OR RELATIONSHIP, REGARDLESS OF THE DOLLAR AMOUNT, WHICH IS DIFFERENT THAN THE UNIVERSITY POLICY FOLLOWED BY OTHER SCHOOLS. Any income over \$10,000, or stock or stock options valued at over \$10,000 or 0.5% of the total value of a publicly traded company, or stock options or promises of stock in any amount in a private company, are deemed a significant financial interest. These must be evaluated in light of the research, the financial relationships and eliminated, mitigated or managed. Strategies for doing this include:

- require disclosure of the financial interest in publications and public discussions of the research;
- modify the research plan;
- disqualify a participant from all or a portion of the project;
- require severance of a relationship;
- require divestiture of a financial interest;
- exclude intellectual property from being licensed to a company in which there is a financial interest;
- manage the conflict through an oversight committee; and/or
- other strategies, as deemed appropriate

Again, I would strongly encourage you to review this fact sheet and if you have any questions please check with Barbara Flynn (Barbara.Flynn@stanford.edu) or Dr. Harry Greenberg (Harry.Greenberg@stanford.edu).

NIH Public Access Policy

Over the past several years a number of leading scientists, including Dr. Pat Brown, Professor of Biochemistry, have advocated for a public library of science. Their position has been sound and well reasoned. On February 3, 2005 it was supported by an official directive from NIH Director Elias Zerhouni entitled "NIH Policy on Enhancing Public Access to Archived Publications Resulting from NIH-Funded Research." While this policy is voluntary I firmly believe that all members of our Stanford community and those in academic centers and universities across the country should actively embrace it. Below is an excerpt from Dr. Zerhouni's February 3rd letter to the biomedical research community. Please lend your support.

This Policy applies to all research grant and career development award mechanisms, cooperative agreements, contracts, and institutional and individual Ruth L. Kirschstein National Research Service Awards, as well as NIH intramural research studies.

This Policy requests that beginning May 2, 2005, NIH-funded investigators submit to the NIH National Library of Medicine's PubMed Central (PMC) an electronic version of the author's final manuscript, upon acceptance for publication, resulting from research supported in part or in whole with direct costs from NIH. The author's final manuscript is defined as the final version accepted for journal publication, and includes all modifications from the publishing peer review process. These manuscripts will be preserved permanently in the PMC archive for use by the public, health service providers, educators, scientists, and NIH.

Again, please review these important policies. I strongly recommend that they be embraced and followed by our Stanford community. In closing, I would like to thank Dr. Brown for his important leadership and advocacy on this very important issue.

More About New Graduate Housing

On Monday evening, February 14th, Provost John Etchemendy held a town hall meeting to update faculty and other interested individuals about the proposed graduate student

housing proximate to the School of Law and to provide a forum for discussion. Having informed you of the array of issues concerning this topic in the January 24th Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/01_24_05.html), I attended this meeting as a resident of the neighborhood most immediately impacted by the project and as a faculty member and University official. In my opinion, the Provost did an excellent job in presenting (or more accurately re-presenting) the reasons for this project. He explained, again, why it is so essential to the Law School and to the University more broadly, in the areas of graduate housing, undergraduate housing and, importantly, the initiation and completion of the Science, Engineering and Medicine Campus facilities.

There is no doubt that the size and density of the proposed graduate housing project, as well as its location, have engendered concerns and some consternation by faculty residents, students and others. I felt that the Provost was quite balanced in his presentation. He offered clear evidence of how the University administration and building design group have listened to the previously expressed concerns and have significantly modified the project to address them. Indeed, additional modifications are still underway. At the same time the Provost made it clear that the space limitations of the University and the impact of the constraints of the General Use Permit (GUP) have made it essential to design buildings with a higher density (expressed as "floor to area ratio" or "FAR"). He also said that, whether this site is used for this project or a different one, it will be used in the future for a higher FAR project than exists presently.

Knowing that virtually every building project will have its detractors, especially when it is larger than desired by its surrounding community, I felt the Provost provided explanations that made all but a few feel more comfortable with the evolving plan and appreciative that their voices and concerns were being addressed. Even though the town hall meeting lasted well over two hours, I am sure that lingering concerns and dissatisfactions remain. However, I do believe that the University has made a valid and compelling case for why this project is so important. As both a resident and faculty member I support it and call on all others in our community to do so as well.

Upcoming Sessions on the Respectful Workplace: Please Attend if You Haven't Already Participated

As many of you may recall, I have written about the Respectful Workplace Initiative on several other occasions. I wholeheartedly support this effort and hope to see the culture at the school improve as we all strive to foster respectful interactions at work. For the past few years, we have conducted briefings for all members of the faculty and staff. Students and Postdoctoral scholars will receive briefings next. The hope is to involve all members of the School community in an understanding of what are the elements of a respectful workplace and what are the resources available to all to ensure that the workplace is characterized by civility and decency.

I recently been informed that the staff briefings, in particular, have been occasions for fruitful discussion the nature of a respectful environment and suggestions for solving difficult work situations. Some of the comments from the staff include providing a constructive and open environment for communication, encouraging discussion of

problems in a non-blaming manner, apologizing when you boil over on a bad day, learning to listen and giving your coworkers and others the benefit of the doubt. Almost every single session included the request that people use the words "please" and "thank you" and acknowledge work well done. Sadly, many reported that oftentimes, everyone is so busy, people do not even greet each other in the morning or say good-bye at night. I am told that many of the plans for addressing various scenarios given to the audience to work on in small groups were thoughtful and creative. The presenters are planning to provide highlights of the sessions in a later Stanford Report story and online. While I have only touched on several aspects of the training, **I urge those of you who haven't yet attended to go the two make up sessions this week at Fairchild Auditorium (Tuesday, February 22nd at 3 pm and Wednesday, February 23rd at 1 pm) and participate in changing the culture of the Medical School.**

Celebration for Dr. Leonore Herzenberg

On February 11-12th, past and present faculty, students, staff, collaborators and friends gathered to celebrate the 70th birthday of Dr. Lenore Herzenberg and to honor her with a wonderful symposium on B-Cell Development, Function and Neoplasia. The Herzenberg Laboratory (or Lee and Len) has had a transforming effect on science and medicine through the development of novel and important technologies (most notably of course FACS) as well as many other innovations and scientific insights. It is hard to imagine how we would understand or have even approached such serious disorders as AIDS and cancer, or basic phenomena such as stem cell biology, among many other areas, without FACS! As scientists, mentors, advocates and leaders the Herzenberg Laboratory has been part of the fabric of the Stanford School of Medicine since 1959, when the school first moved to Palo Alto from San Francisco. Their collaborations and contributions are legendary, and this was certainly well evidenced by the international community who came to honor Lee and wish her a Happy Birthday – and many more to come.

Honors and Awards

- **Dr. Sherry M. Wren**, Associate Professor of Surgery, has been selected to receive an Outstanding Teacher Award from the Association for Surgical Education. This award is presented annually to recognize the dedication of surgical educators. It is meant to reward teaching excellence and to further emphasize teaching as an important area of expertise. Congratulations to Dr. Wren!

Appointments and Promotions

- **Steven Artandi** has been reappointed Assistant Professor of Medicine, effective 11/01/2005.
- **Mary Kate Bundorf** has been reappointed Assistant Professor of Health Research and Policy, effective 3/01/2005.
- **Manuel Garcia** has been reappointed Assistant Professor of Comparative Medicine, effective 9/01/2005.

- **James Hallenbeck** has been reappointed Assistant Professor of Medicine (General Internal Medicine) at the Palo Alto Veterans Affairs, effective 7/01/2005.
- **Susan Hintz** has been reappointed Assistant Professor of Pediatrics at Lucile Packard Children's Hospital, effective 7/01/2005.
- **Steven Howard** has been reappointed Associate Professor of Anesthesia at the Palo Alto Veterans Affairs Health Care System, effective 10/01/2005.
- **Ginna Laport** has been reappointed Assistant Professor of Medicine (Bone Marrow Transplant), effective 10/01/2005.
- **Sean Mackey** has been reappointed Assistant Professor of Anesthesia, effective 8/01/2005.
- **Michael Marks** has been promoted to Professor of Radiology, effective 3/01/2005.
- **Rebecca Smith-Coggins** has been reappointed to Associate Professor of Emergency Medicine, effective 9/01/2005.

Dean's Newsletter

March 7, 2005

Continued Progress Toward Our Application to Become an NCI-Designated Comprehensive Cancer Center

On Saturday morning February 26th, faculty gathered in the Clark Center for a Scientific Retreat that updated plans for our application to the National Cancer Center to become a designated Comprehensive Cancer Center. At this time we hope to submit our application in October of 2005. During the past year we accomplished a number of key elements that will enable our ultimate success. These included:

- **Leadership**
 - The appointment of Dr. Irv Weissman as the Principal Investigator of the proposed Comprehensive Cancer Center.
 - The decision to search for a Deputy Director of the Comprehensive Cancer Center who will work with Dr. Weissman to direct the program operationally and provide scientific oversight. A search has been carried out for this position and we hope to name the successful candidate shortly.
 - The appointment of key Associate Directors including:
 - Dr. Mike Cleary as Associate Director for Basic Science
 - Dr. Ron Levy as Associate Director for Translational Science
 - Dr. Steve Leibel as Associate Director for Clinical Research and Care
 - Dr. Dee West as Associate Director for Population Sciences
 - Ms. Joanne Murphy as Associate Director for Administration and Planning (Ms. Murphy began officially on March 1st)
 - Still to be named is the Associate Director for Shared Resources.
- **Program Development**

- Since the last External Advisory Committee meeting in March 2004, continued development has taken place regarding the scientific programs that will comprise the Comprehensive Cancer Center application. Going in to the Scientific Retreat on Saturday there were nine proposed projects (4 basic, 4 clinical and one population sciences). As a result of the discussion, it is likely that two of the programs will be combined and one expanded. Accordingly the current iteration of proposed projects is as follows:

- **Basic Science Programs**

<i>Program</i>	<i>Principal Investigators</i>
Cancer/Stem Cell Biology	Drs. Irv Weissman & Roel Nusse
Radiation Biology	Drs. Amato Giaccia & Quynh Le
Cancer Biology	Drs. Mike Cleary & Linda Boxer
Cancer Imaging	Drs. Sam Gambhir & Chris Contag

- **Clinical Sciences Programs**

<i>Program</i>	<i>Principal Investigators</i>
Systematic Molecular Profiling of Cancer	Drs. Pat Brown and Stephanie Jeffries
Program in Lymphoma	Drs. Ron Levy and Sandra Horning
Cancer Immunology	Dr. Edgar Engleman and Mark Davis
Hematopoietic Cell Transplantation and Immune Reconstitution	Drs. Robert Negrin and Kenneth Weinberg

- **Population Science Program**

<i>Program</i>	<i>Principal Investigators</i>
Cancer Epidemiology, Prevention, Outcomes, & Education	Drs. Dee West and Alice Whittemore

We heard updated progress reports for these program areas, and they were superb. Significant progress has been made in each area, and we now have a greater understanding of how the Comprehensive Cancer Center would enable each to engage a wider community. We had the benefit of two external consultants (Dr. Beverly Mitchell, Professor of Medicine at UNC, and Dr. Michael Clarke from U. Michigan), who offered an important perspective on the individual projects and how they might fare within our proposal. The next steps are to gather comments from those who attended

the retreat and to further refine the program proposals for presentation to our External Advisory Group on May 26th.

An additional notable programmatic accomplishment was the finalization of our Stanford-Northern California Cancer Center (NCCC) affiliation agreement in December 2004.

In addition to the program project proposals, the application we plan to submit to the NCI on October 1st will contain 13 shared resource proposals, as follows:

<i>Share Resources/ Cores</i>	<i>Principal Investigators</i>
Cancer Biostatistics	Drs P. Lavori and T. Lai
Clinical Trials Support	Drs. G. Fisher & M. Bischoff
Protocol Review & Monitoring Systems	Drs. S. Knox, S. Horning, R. Carlson, S. Srinivas
Informatics Core	Dr. H. Lowe
Animal Colonies	Drs. R. Tolwani & M. Garcia
Transgenic & Knock-Out Mice	Drs. M. Cleary, D. Felsher, Y. Chen Tsai
Cell & Tissue Procurement	Drs. J. Pollack & J. Norton
Cancer Imaging Core	Drs. C. Contag, S. Gambir, B. Daniel
Confocal & Immunoelectron Microscopy	Drs. S. Smith & J. Mulholland
Flow Cytometry	Drs. G. Nolan & L. Herzenberg
DNA Microarrays	Dr. G. Sherlock, M. Fero, C. Ball
High Throughput Genomics	Drs. R. Davis, M. Mindrinos, W. Xiao, H. Li
Proteomics	Dr. P. Jackson

- **Facilities**

One of the major limitations we currently face is research space. To help during the immediate period ahead, the School has leased off-campus space on Arastradero Road to provide an interim home for our Cancer/Stem Cell Institute and cancer related programs. While we certainly recognize the limitations associated with research space that is remote from the central campus, it is our hope that this off-site space will enable us to launch key programs and recruitments while we are working on the planning and development of the Stanford Institutes of Medicine #1 facility that will be just south of the CCSR building.

Overall, we are continuing to make important progress in our quest to become an NCI-designated Comprehensive Cancer Center. While we still have much work to do, I am very encouraged by what has been accomplished to date and believe that if we stay on the current trajectory, we will be successful in submitting our proposal this October. Continuing appreciation to Dr. Karl Blume for all that he has done to get us to this point.

Launch of the Protocol Review and Monitoring System

In April 2005 we will take another significant step towards Stanford's proposed Comprehensive Cancer Center with the launch of the Protocol Review and Monitoring System (PRMS) Core under the direction of Susan Knox, Ph.D., M.D. This core will operate two important committees required for a Comprehensive Cancer Center: the *Scientific Review Committee* and the *Data and Safety Monitoring Committee*.

The *Scientific Review Committee (SRC)* will review for scientific merit all cancer-related clinical research protocols involving human subjects, including prevention, translational, and psychosocial studies. Cancer studies can be submitted in parallel to Stanford's Administrative Panels on Human Subjects in Medical Research (IRBs). Both the Scientific Review Committee and the IRB must approve each cancer-related clinical research study before it can be opened to accrual. The Scientific Review Committee is being led by Sandra Horning, M.D. and Robert Carlson, M.D.

The *Data and Safety Monitoring Committee (DSMC)* will monitor all cancer-related investigator-initiated trials and will monitor safety reports for all cancer-related studies. The Data and Safety Monitoring Committee is being led by Susan Knox, Ph.D., M.D., and Sandy Srinivas, M.D.

In order to support these efforts, the Biostatistics Core, led by Philip Lavori, Ph.D., and the Cancer Clinical Trials Office (CCTO), led by George Fisher, M.D., Ph.D. and Miriam Bischoff, M.S., M.B.A., are available to support clinical investigators' efforts to initiate their trials. There will be a presentation on Tuesday March 29, 2005 at 8AM in the Cancer Center Conference Rooms to discuss the three cores (Biostatistics, CCTO, and PRMS), the new committees (SRC and DSMC), and the new standard operating procedures. All cancer center faculty involved in clinical research are encouraged to attend since the committees' activities will officially begin on Monday April 4, 2005.

Stanford Hosts the ICOC

On Tuesday, March 1st Stanford hosted the 3rd (official) meeting of the Independent Citizen's Oversight Committee (ICOC) in the Fairchild Auditorium. The ICOC serves as the equivalent of a Board of Trustees for the California Institute for Regenerative Medicine (CIRM), which came into being following the passage of Proposition 71 by the citizens of California on November 2nd 2004. Because all meetings of the ICOC are public, the 29-member committee carried out its work in an open forum, with opportunities for public comment throughout the meeting. As you may know, State Controller Steve Westly appointed me to the ICOC on November 4 2004.

While the goal of the CIRM is to fund research proposals and facilities, its first steps have necessarily been focused on building the infrastructure to support its activities and establishing the standards that will guide them. Accordingly, special attention has been given to the best practices in such areas as grant making and conflict of interest at organizations including the National Academy of Sciences, NIH, NSF and non-profit foundations like the Juvenile Diabetes Foundation and the Gates Foundation. Some of the best practice guidelines are generic, whereas others are specific to stem cell research.

In this context, the National Academic of Sciences is expected to issue a report this April on guidelines that might be used to regulate stem cell research, including embryonic stem cell research and somatic cell nuclear transfer. This report, which we are eagerly anticipating, is being prepared by the Life Sciences Board of NAS and is co-chaired by Richard Hynes from MIT and Jonathan Moreno from UVA. The stimulus for this report came from the Health Science Policy Board of the Institute of Medicine (which I chair) and from very important insights from individuals, including Drs. Paul Berg and Irv Weissman. It is hoped that these guidelines will provide the same safeguards for assuring the highest quality stem cell research along with the highest ethical and safety standards as the guidelines developed a quarter of a century ago for recombinant DNA technology.

Despite the fact that nearly 60% of the citizens of California voted for Proposition 71, stem cell research remains controversial throughout the nation and indeed the world. In just the past couple of weeks, selected countries in the United Nations (including the US) increased their efforts to have the UN take an international stance against cloning that would include somatic cell nuclear transfer (sometimes inappropriately referred to as “therapeutic cloning”). Of course there is concurrence that reproductive cloning should be banned. But there is considerable support and scientific interest in somatic cell nuclear transfer, which most do not view as a form of cloning per se.

In addition to the actions being sought at the UN, efforts are underway to ban embryonic stem cell research (and somatic cell nuclear transfer) in a number of states, including, most recently, Missouri, Texas, and Massachusetts. Moreover, the debate continues in the Congress and especially in the Senate. Some senators (e.g., Brownback) are seeking to ban and even criminalize embryonic stem cell research whereas others (e.g., Orrin Hatch) continue to offer their support for this research. This is occurring at the same time that several other states (e.g., Wisconsin, New Jersey, Connecticut, Maryland) are in the process of passing or have passed funding mechanisms to support embryonic stem cell research. Clearly this issue continues to divide communities, political leaders and religious organizations. While recognizing the rights of individuals to have different points of view, I personally believe that this research can and should be conducted with the highest ethical standards, that it will foster new knowledge, and that it has the potential to result in new therapies for an array of serious medical disorders. This is what the citizens of California wanted as well when they voted on Proposition 71. Nevertheless, it is notable that in the past days two lawsuits questioning the authority of the CIRM to fulfill its mandate have been filed.

Of course all of this makes it incredibly important that the California Institute for Regenerative Medicine be as successful as possible. I have been quite encouraged by the efforts and commitments of my co-members on the ICOC. Whether disease advocates, academic leaders or industry leaders, everyone has been working diligently to help fully initiate and support the CIRM. An important step occurred at the March 1st meeting when Dr. Zach Hall was named Interim President/CEO and Senior Science Policy Advisor for the CIRM. As a number of you likely know, Dr. Hall has had a stellar career in science and administration. An internationally recognized neuroscientist with a long career at UCSF, Dr. Hall also served as the Director of the National Institute of Neurological Diseases and Stroke and subsequently as a vice provost for research, first at UCSF and more recently at USC. His appointment will be for one year. During that time he will play a key role in establishing the infrastructure and the policies that will guide the CIRM. Having Zach as Interim President and CEO is enormously valuable. Among many other benefits, his presence will permit the search for the permanent president for the CIRM, which is now underway, to proceed with resolve.

Of course the primary and critical purpose of the CIRM is to award grants to scientists conducting research in stem cell biology and regenerative medicine in California. Naturally we would all like that process to commence as soon as possible. But it is imperative that the ICOC assures that funding, when it begins, supports the highest quality research proposals with the highest ethical standards. With the appointment of an Interim President, more rapid progress can now be made to make this happen – hopefully by summer. More details will follow in future Newsletters.

A Lesson in Bicycle Safety

It has been a while since I have written about bicycle safety on campus, even though I worry about it every day- especially when I drive home at night and see many individuals riding bicycles without helmets or any forms of lighting or reflections. But my concerns were rekindled this past week when I was walking to the Campus Drive/Roth Way garage across from the medical school. It was about 8 PM, and it had begun raining just a short time prior. As I entered the garage I heard squealing brakes at the Campus Drive crosswalk and then a shout of “Oh my God!” Rushing to the scene I saw a bicycle trapped under the front wheels and hood of a BMW. Amazingly, the rider – who had been thrown off the bike – had already risen from the ground and was alert, although with arm and shoulder discomfort. Thankfully the rider had been wearing a bike helmet, which, as it turned out, was cracked at the point of contact where he had hit the ground. He did not sustain a serious injury and it is clear that the helmet was most important in preventing that. But, as I looked at his bike under the car’s tires I did not see any visible headlight! Given the fact that much of the campus is dark at night, this incident only further emphasizes how important it is to for all bikers to wear a helmet and to have a head and tail light. That the injured biker turned out to be one of our medical students made this lesson all the more real and personal to me.

Bottom line: If you are a bike rider please make sure to wear a helmet and use head and tail lights. Prevention is key and these simple measures can prevent disasters.

Biosciences Interview Weekend

This past weekend was the Biosciences Interview Weekend. This year the Stanford Biosciences program received some 1015 applicants, of whom 239 were invited for interviews. During their visit, approximately 6 faculty members interviewed each of the applicants. In addition to these one-on-one interviews, applicants also met informally with faculty to discuss scientific projects and had informal time at lunches and dinners to meet with faculty and other students. Students who are accepted to the program will need to make their final decision by April 15th.

In addition, on Saturday morning, March 5th, applicants who self-identified as under-represented minority students joined current Stanford students and faculty for a breakfast meeting that highlighted Stanford's commitment to enhancing diversity. I want to thank Anika Green, who joined Stanford this past year as the Assistant Dean for Graduate Education and the Director of the Biosciences Diversity Program, for the exceptional work she and her colleagues have done to share the excellence of our bioscience program and to further our efforts to enhance diversity among our students, faculty and staff.

Many faculty, students and staff worked diligently to make the interview weekend successful. I want to particularly thank John Bray, Interim Director of Biosciences Admissions, who has played an important role in make this year's admissions process successful. I also want to thank Velessa Peairs, Shannon Monahan, Julia Tussing and Ellen Porzig for all of their contributions.

Upcoming Medicine and the Muse Symposium

Dr. Audrey Shafer has informed me that this year's Medicine and the Muse Symposium will be held on Thursday, April 21st, at 5:00 p.m. at the Cantor Arts Center Auditorium. The program will include, in addition to presentations, music, and an art exhibit by Stanford medical students, a keynote address by David B. Morris, PhD entitled "Pain and Narrative: Where Does It Hurt?" Dr. Morris is University Professor at the University of Virginia and the author of *The Culture of Pain; Illness and Culture in the Postmodern Age.* The Symposium is free and open to the public, and a reception will follow the symposium. For further information, contact Dr. Shafer at ashafer@stanford.edu.

Events

- **Working Group on Parkinson's Disease at Stanford:** On Saturday morning, March 5th, the Neuroscience Institute at Stanford (NIS) and its Work Group on Parkinson's Disease conducted an educational dialogue with interested community members, including patients, that addressed new research breakthroughs on the use of stem cell research, the use of growth factors, and other novel interventions. Drs. Clive Svendsen and Olle Lindvall gave presentations, and Drs. Theo Palmer and Jamie Henderson served as hosts. I had the opportunity to address the group and to share our vision both for the

Neuroscience Institute of Stanford and for the important opportunities emanating from the California Institute on Regenerative Medicine (see above). I want to thank Drs. Palmer, Assistant Professor of Neurosurgery, and Henderson, Assistant Professor of Neurosurgery, for organizing and leading this program. It was clearly very much appreciated by all who attended, and it represents an additional way in which Stanford is helping to engage our community to advance *Translating Discoveries*.

- **Community Lecture Series:** On Wednesday evening March 2nd, Dr. Steve Galli, Mary Hewitt Loveless Professor of Pathology and of Microbiology and Immunology and Chair of Pathology, gave an excellent presentation on "Individualized Medicine: Revolutionary Developments in the Understanding, Classification, Diagnosis and Prevention or Treatment of Disease". This was one of our ongoing series of community lectures, which continue to draw large audiences and receive outstanding praise for our community.

In Memoriam

I have recently learned that Dr. John Luetscher, who came to Stanford University School of Medicine some five decades ago, recently expired. Dr. Luetscher was an outstanding clinical scientist who carried out seminal studies on the hormonal regulation of salt and water metabolism. He was an individual of enormous intellectual rigor, which he effectively incorporated in his activities as teacher, clinician and investigator, and he played an important role in helping to make Stanford a great School of Medicine.

Awards and Honors

- **Dr. Marilyn Winkelby**, Professor of Medicine, has been named the recipient of the Roland Volunteer Service Prize from the Haas Center this year. The award will be presented in a ceremony on May 3. The Miriam Aaron Roland Volunteer Service Prize provides "an award to Stanford faculty who--over and above their normal academic duties--engage and involve students in integrating academic scholarship with significant volunteer service to society." The prize was established by alumna Miriam Roland ('51, International Relations) of Montreal, Canada, as an endowment at the Haas Center for Public Service. The inaugural prize was presented on March 31, 2004. Congratulations to Dr. Winkelby.
- **Dr. Mary Lake Polan** has been selected as one of Women's eNews 21 Leaders for the 21st Century. Profiles of all the honorees can be found at www.womensenews.org/21leaders2005.cfm. Dr. Polan, along with 20 others women was selected from more than 200 nominees. She will be honored at a gala on May 17th at the Tavern on the Green in New York City. Congratulations to Dr. Polan.

Appointments and Promotions

- **Sally Arai** has been appointed to Assistant Professor of Medicine (Bone Marrow Transplantation), effective 3/01/2005.
- **Andrew Connolly** has been appointed to Assistant Professor of Pathology, effective 3/01/2005.
- **Gary Luxton** has been reappointed to Associate Professor of Radiation Oncology, effective 9/01/2005.
- **Ellen Porzig** has been reappointed Associate Professor of Developmental Biology, effective 9/01/2005.
- **Yuen Tat So** has been promoted to Professor of Neurology and Neurological Sciences, effective 3/01/2005.

Dean's Newsletter March 21, 2005

The Match 2005

Until recently it seemed that the annual Internship Match was in jeopardy due to a lawsuit regarding the anti-trust nature of the Match. I am happy to say this is no longer an issue. On Thursday March 17th, at 10 AM Pacific Coast time – and synchronized by time zone - letters were delivered to the 14,700 graduating medical students across the nation who participated in this year's National Resident Matching Program. The letters informed them of where they "matched." Notably, there were 24,012 positions available this year, of which 22,221 were filled by graduating seniors as well as graduates of osteopathic medical schools, foreign medical graduates, and individuals who had taken time off after medical school or who are changing to a different specialty. Approximately 25,300 individuals participated in the match.

At Stanford some 65 students participated in the 2005 Match - a relatively smaller number of students than usual. Of note, current forecasts suggest that next year's graduating class could be nearly twice that number! Our 2005 graduating medical students chose a broad range of specialty programs. Eight will pursue training in Internal Medicine and seven in Pediatrics. The next most common selections by Stanford students include: Dermatology (6 students), Psychiatry (6), Radiology (6), General Surgery (5), Anesthesia (4), Emergency Medicine (4), Family Practice (4), Orthopedic Surgery (4), Obstetrics/Gynecology (3), Ophthalmology (2), Radiation Oncology (2), Otolaryngology (1), Neurology (1), Neurosurgery (1), and Physical Medicine/Rehabilitation (1). In a number of specialties (e.g., anesthesia, radiology, surgical subspecialties), students must do a transitional year in medicine or surgery before beginning their destination specialty program.

On a national basis, certain trends in specialty selection continued this year. Some of these mirror our student selections. For example, the increase in students applying in psychiatry has continued for the past several years. So too have student interests in dermatology, emergency medicine, and orthopedic surgery. Interestingly, approximately 20% of students nationally choose Internal Medicine.

Also of interest is the fact that nearly a third of our graduating medical students will remain at Stanford programs for the residency – an affirmation of the excellence of our graduate medical training programs as well as our students. Thanks to the Stanford Medical Alumni Association, students, family and friends celebrated this important milestone at the Tenth Annual Match Day Celebration on Thursday evening at the Stanford Faculty Club. As always it was a special event and I want to thank the SMAA for hosting it.

I also want to thank the graduating class for their wonderful participation in this year's Medical Student Gift Challenge. Remarkably, more than 93% of students participated in this gift. This level of support is truly outstanding, and. I want to express my deep appreciation and admiration to everyone in the graduating class.

Following is the list of our graduating students and the programs to which they "Matched." Please join me in extending our congratulations and best wishes to this year's graduating medical school class.

2005 Match Results for Graduating Students

Agredano, Yolanda Zamora	Stanford Univ Progs-CA	Psychiatry
Ali, Unzila A.	Yale-New Haven Hosp-CT	Obstetrics-Gynecology
Alvarado, Rosalinda	Rush University Medical Center-IL	General Surgery
Anandasabapathy, Niroshana	Mt Sinai Hospital-NY NYU School Of Medicine-NY	Medicine-Preliminary Dermatology
Austin, Jennifer Maria	Brigham & Womens Hosp-MA	Internal Medicine
Bein, Sarah Ruth	UCLA Neuropsych Inst-CA	Psychiatry
Bermudez, Dustin Miguel	Hosp of the Univ of PA	General Surgery
Cano, Richard Paul	Stanford Univ Progs-CA Stanford Univ Progs-CA	Surgery-Preliminary
Chang, Johanna Chi	UC San Diego -CA	Pediatrics
Chevez, Shari Garcia	Stanford Univ Progs-CA	Pediatrics
Cho, Raymond Jaihyun	Santa Clara Valley MC-CA UC San Francisco-CA	Transitional Dermatology
Coon, Valerie Catherine	U Utah Affil Hospitals-UT	Neurological Surgery
Cotter, Brooke Megan	Stanford Univ Progs-CA	Internal Medicine

Czaban, Brenda Lora	U Colorado SOM-Denver-CO	Psychiatry
Fleischman, Ross Joseph	Oregon Health & Science Univ-OR	Emergency Medicine
Ghanouni, Pejman	Santa Clara Valley MC-CA Stanford Univ Progs-CA	Transitional Radiology-Diagnostic
Gubens, Matthew Alfred	UC San Francisco-CA	Internal Medicine
Haus, Brian Michael	Massachusetts Gen Hosp-MA	Harvard Combined Ortho
Hiroshima, David	O'Connor Hospital-CA	Fam Practice/San Jose
Hsu, Christopher Posien	Santa Clara Valley MC-CA UCLA Medical Center-CA	Transitional Radiology-Diagnostic
Hsu, Gloria Pu-Ye	Rhode Island Hosp/Brown U-RI	General Surgery
Hsu, Phillip TzuKang	U Wisconsin Hosp/Clinics-WI	Medicine/Dermatology
Huang, Kathie Pei	Stanford Univ Progs-CA Stanford Univ Progs-CA	Medicine-Preliminary Dermatology
Jun, Peter	Santa Clara Valley MC-CA UC San Francisco-CA	Transitional Radiology-Diagnostic
Karanjia, Navaz P.	Stanford Univ Progs-CA UC Los Angeles-CA	Medicine-Preliminary Neurology
Kim, Karen Chunguhn	Case Western/U Hosps Cleveland-OH	Internal Medicine
King, Angela Goffredo	Oregon Health & Science Univ-OR	Internal Medicine
Kirilcuk, Natalie Nina	Stanford Univ Progs-CA	General Surgery
Kohrt, Holbrook Edwin	Stanford Univ Progs-CA	Internal Medicine

In addition to the Match for our graduating Stanford Medical students, Match Day is equally important for our post-graduate training programs at Stanford Hospital and at Lucile Packard Children's Hospital. Our various specialty disciplines offer some 151 internship slots that attract students from Stanford as well as other leading programs. As with our medical students, each of these discipline-based residencies also had wonderful success in recruiting their top choices. The diversity of offerings and number of programs is listed below:

Program	Number Accepted	Number of Stanford Students
<i>Anesthesia</i>	17	3
<i>Dermatology</i>	5	2
<i>Emergency Medicine</i>	10	1
<i>Internal Medicine</i>	28	2
<i>Medicine (Preliminary)</i>	9	3
<i>Neurology</i>	5	1
<i>Neurological Surgery</i>	2	0
<i>Obstetrics-Gynecology</i>	4	1
<i>Orthopedic Surgery</i>	4	1
<i>Pathology</i>	6	0
<i>Clinical Pathology</i>	1	0
<i>Pediatrics</i>	20	2
<i>Physical Medicine & Rehabilitation</i>	5	0
<i>Plastic Surgery</i>	3	0
<i>Psychiatry</i>	8	1
<i>Psychiatry/Research</i>	1	1
<i>Radiology-Diagnostic</i>	7	2
<i>Radiation Oncology</i>	3	1
<i>General Surgery</i>	6	2
<i>Surgery (Preliminary)</i>	4	1
<i>Surgery Preliminary/ORL</i>	3	1
<i>Urology</i>	3	0
<i>Transitional/Anesthesia at SCVMC</i>	2	1
Totals	151	25

Congratulations to our various Program Directors and Training Programs for an excellent match – and also to the many students who will be joining the Stanford family in June/July from around the nation for graduate medical education.

A Need to Engage and Improve

Even as we extol the accomplishments of our students and graduate medical training programs it is important also to acknowledge more sobering data that was presented to the Medical School Faculty Senate on Wednesday March 16th. These data were regarding the performance of our students in the Clinical Performance Examination and on the evaluation of our first and fourth quarter course evaluations. More specifically, I am not pleased with the Clinical Performance results that evaluate the history taking and physical examination skills of our students. It seems clear that we need to improve both as an institution in emphasizing these skills. A problem that has been clearly identified is the difficulty in getting faculty to engage and teach physical exam and history taking skills. Certainly I recognize that identifying experienced faculty to teach has become more challenging due to the time constraints on faculty. But the consequences are too serious to ignore. We must do better. I want to call this matter to the attention our faculty and implore each person to participate more fully in bedside teaching. We will be talking about this issue more broadly and identifying a remediation plan that will be discussed in the near future.

Also at the March 16th Senate meeting, Dr. David Fetterman described a new evaluation system that provides a helpful way to review the positive and negative evaluation of courses – remediation plans to be put in place rapidly. Overall, courses in the new curriculum are receiving excellent reviews, with a few exceptions that are being addressed by the Committee on Courses and Curriculum, the Office of Medical Education and the relevant departments. Importantly the evaluation system provides a more analytic assessment of why a course is doing well or not and thus permits the ability to develop plans for improvement. While it is important to acknowledge that a number of the evaluated courses were well received, it is equally important to note that all the course leaders are eager to find ways to improve their offerings. Feedback is enormously important in guiding change and improvement, and we are certainly committed to both.

Commonwealth Reflections

On March 9th I had the opportunity to speak at the Commonwealth Club in San Francisco, where I addressed an array of challenges facing American Medicine in the 21st Century. One of the ironies in our current situation is that, at the same time as scientific insights and innovations are becoming increasingly abundant and promising, our health care system is becoming increasingly dysfunctional. Some of my comments were reported in the latest issue of the Stanford Report (<http://news-service.stanford.edu/news/2005/march16/med-pizzo-031605.html>) and I will not repeat them here. However, I did want to note that, while I have commented in various settings on my view that a radical change, such as a single payer system, is needed, I am also intrigued by a proposal developed by Ezekiel Emmanuel and Victor Fuchs that is built on health care vouchers. Their proposal will be published as a Sounding Board article in the March 24th issue of the New England Journal of Medicine, which that will be available later this week. I would certainly encourage you to review their article.

Events

- ***Appreciation to Dr. Bruce Reitz:*** On March 8th we had the opportunity to honor and thank Dr. Bruce Reitz, Norman E. Shumway Professor of Cardiothoracic Surgery, for his extraordinary contributions as a surgeon, innovator, faculty leader and, for the past 12 years, Chair of the Department of Cardiothoracic Surgery. Dr. Reitz has established a remarkable record of accomplishment and excellence and has done so with humility and dignity that is nonpareil. I want to thank Dr. Reitz again for all that he has done for Stanford to date and to wish him well on his well deserved sabbatical. We certainly will look forward to welcoming him back to the Stanford community when he returns both renewed and ready to take on new challenges!
- ***A New Era of Psychiatry:*** On Monday evening March 7th, Dr. Alan Schatzberg, Kenneth T Norris, Jr. Professor and Chair of the Department of Psychiatry and Behavioral Science, and his colleagues hosted an exciting program on the new breakthroughs occurring in the diagnosis, treatment and prevention of psychiatric disorders. Important topics included bi-polar disorders; depression; schizophrenia; stress, health and integrative medicine; and women's wellness, menopause and hormones. The evening consisted of faculty presentations as well as informal discussion groups with members of the community. It was enormously well received. I want to also thank the faculty who helped to make this event so successful.

Dean's Newsletter April 4, 2005

National Advisory Council Reviews School

On Monday March 21st, the School of Medicine's National Advisory Council (NAC) made their second annual visit to assess our progress in achieving our strategic and mission-specific initiatives. Their first visit was exactly a year ago, in March 2004.

The NAC is chaired by Dr. Ed Benz, President of the Dana Farber Cancer Institute and Professor of Medicine at Harvard Medical School. Council members also include Dr. Elizabeth Blackburn, Professor of Biochemistry & Biophysics at UCSF, Dr. Tom Boat, Professor and Chair of Pediatrics at the University of Cincinnati and Pediatrician-in-Chief of Cincinnati Children's Hospital, Mr. William Halter, Stanford University Board of Trustees Emeritus, Dr. Daniel Lowenstein, Professor of Neurology, UCSF, Dr. Bil Acting President of Morehouse University, Dr. Carla Shatz, Professor and Chair, Department of Neurobiology at Harvard Medical School, and Dr. Sam Wells, Professor Emeritus, Duke University School of Medicine. Drs Satcher and Shatz were unable to attend this meeting but have been engaged in our progress via other communications.

This year's NAC began with a presentation I gave on "The Year in Review and Paving a New Future". I reviewed the progress we have made in achieving our Strategic Plan Translating Discoveries as outlined in the January 10th Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/01_10_05.html) and highlighted the major challenges we face over the coming months and year:

Education: Further refining the New Stanford Curriculum, including improving the didactic courses and scholarly concentrations; addressing the clinical rotations and experiences including improving the evaluation system; continued preparation for the upcoming LCME review this October; further development of clinical courses for bioscience students; working with the University on the Graduate Education Initiative; initiating a program for graduate education opportunities for clinical fellows; rebasing the program for continuing medical education.

Research: Continuing to support and advocate for basic science research throughout the school, recognizing this as our true core strength; further developing the infrastructure to support translational research through SPCTRM (Stanford/Packard Clinical-Translational Research Medicine) and STRIDE (Stanford Translational Research Database Environment) programs; continued development of the Stanford Institutes of Medicine, including the specific goal of further developing the stem cell and regenerative biology research programs in preparation of funding from the California Institute of Regenerative Medicine (CIRM). This work is being done in conjunction with our Stanford Program in Regenerative Medicine under the banner of the Stanford Cancer and Stem Cell Institute. In tandem, we are making progress in our application to become an NCI-designated Comprehensive Cancer Center and plan to submit it in October 2005. Progress is also being made in the organization of the Neuroscience and Cardiovascular Institutes and in the initiation of the Immunity, Transplantation and Infection Institute. We are also further developing the Strategic Centers and defining the School's connection to BioX and related University initiatives. In conjunction the School of Engineering, we continue to develop the new Department of Bioengineering, which is already off to a great start, and we are collaborating with University leaders in the broad programs on the Environment and on International Initiatives.

Patient Care: One of the most important tasks is to stay engaged with integrated clinical planning with both Stanford Hospital & Clinics (SHC) and Lucile Packard Children's Hospital (LPCH), both programmatically and for facility utilization. That said, the single most critical task is to complete the process of "funds flow" and begin implementation, albeit with a transition plan, in the FY06 budget. Also key will be the planning for the North Campus and, in tandem, the refinement of the long-range capital plan for both SHC and LPCH.

Professoriate: Of course one of our most important new initiatives is improving diversity throughout the School and in developing a broad ranging program for

leadership training and development, both under the guidance of newly appointed Senior Associate Dean Dr. Hannah Valantine. In addition, continued efforts are underway to better manage our available billets and, importantly, to improve, based on forthcoming recommendations from the Task Force led by Dr. Rob Jackler, the processes and procedures involved in academic appointments and promotions. Also important to our future is the further refinement of our programs to support Clinician-Educators.

Finance and Administration: One of our most important goals is the continued refinement and planning of space to support our research and education missions. We are in the process of completing the “Master Site Plan” for the Medical School Campus, which defines space options and opportunities for the next two decades. First and foremost is the program planning for the Learning and Knowledge Center, which will be located on the site of the Fairchild Auditorium, and Stanford Institutes of Medicine #1, which will be located on the parking lot south of CCSR. The infrastructure plans to support the entire medical site development (including future SIM’s 2-4) will be completed and the future of the original ED Stone Complex will be reassessed, in conjunction with the site development plans underway at SHC. Key to this planning is further refining both the costs of the new building projects, renovation and infrastructure support and, perhaps most importantly, the plans for funding these projects. We hope to have this planning completed in the next two months. In addition to planning for on-sight research space, we are also working actively on the off-site facilities. These include the Arastradero site, which will provide interim space for investigators in the Cancer and Stem Cell Institute and the Neuroscience Institute, as well as the renovations at California Avenue, where the genome centers are located, and the utilization of animal space on Porter Avenue. Given our significant needs for laboratory space we are also looking at the prospect for additional off-site rentals.

Communications/Advocacy/Government Relations: With the continued program development by Paul Costello, Executive Director of Communications and Public Affairs, and Ryan Adesnik, Director of Federal Relations, we have assumed a more vibrant and proactive stance on a number of important issues. Our ongoing agenda of course includes stem cell research, but I have also engaged in a number of issues, including funding support for the NIH, the challenges of conflict of interest, alignment of medical school deans around the upcoming reauthorization of the NIH, the recent issues of clinical trial challenges and the need to develop a clinical trial registry, and our failing health care “system,” among others. I hope you are pleased with the recent issues of *Stanford Medicine*. I anticipate continuing exciting editions in the future.

Development/Philanthropy: Our Office of Medical Development (OMD) is undergoing a needed transformation, thanks to the recruitment of Doug Stewart last October as the Associate Vice President for OMD. Doug has recruited a number of new staff and has reorganized operations. He is now focusing on fundraising plans, which include our key initiatives – the Stanford Institutes of

Medicine, Education and related hospital initiatives. Clearly this is a work in progress, but evidence of improvement is already evident. At the time of this writing, our medical development is \$20 M ahead of this same time last year. But we have some major needs to fill in both capital and program development through the School, Medical Center and University campaigns, as well as a specific need to more than double our annual cash from development. While this will require enormous commitment by our faculty, leaders and of course our OMD staff, I am confident that we will achieve the goals we are setting. I am certainly personally committed to doing all that I can to make this happen.

Planning for the Future: I also discussed with the NAC the important challenge that I believe we – and virtually all – academic medical centers will face in the years ahead. As I discussed in my February 7th Dean’s Newsletter commentary on “Charting the Future and Pondering Some Important Questions” (see http://deansnewsletter.stanford.edu/archive/02_07_05.html#1) I do believe that education and research and their relevance to patient care will undergo transformation as a consequence of new innovations, discoveries and opportunities. Important questions are the rate and pace of change and the ways Stanford can serve as a leader. This potential relevance to Stanford is one of the reasons I posed the broad question of how an academic medical center might be organized in 2005 if we were starting anew and planning to optimize our missions for the next 2-3 decades. Because aspects of this question could have immediate relevance to some of our current department chair recruitments, I also offered some advice to the search committee beginning their work on behalf of the Department of Medicine (see below). Obviously this is an issue we will be discussing and working on in the years ahead.

My presentation was followed by a update on the School’s diversity and leadership initiatives by Dr. Hannah Valentine along with contributions from Chequeta Allen, Assistant Dean for Postdoctoral Affairs, Dr. Gabe Garcia, Associate Dean for Admissions, Anika Green, Assistant Dean for Graduate Studies and Director of the Biosciences Diversity Programs, Dr. Fernando Mendoza, Associate Dean for Minority Advising and Programs, Julie Moseley, Manager of Organizational Development, Dr. Ellen Porzig, Associate Dean for Graduate Studies, and Ellen Waxman, Director of Faculty Relations. Dr. Valentine reviewed the plans she proposed at the School’s Retreat in January (see <http://news-service.stanford.edu/news/2005/february2/med-retreat-020205.html>) and received considerable praise from the NAC for the initiatives being taken and for the broad engagement through the School

The NAC also heard updates on two of the Stanford Institutes of Medicine (Dr. Bobby Robbins, Director of the Cardiovascular Institute, and Drs. Bill Mobley, Director of the Neuroscience Institute, and Karoly Nikolich, Chair of this Institute’s Advisory Council) and two Strategic Centers (Dr. Rick Myers for the Genome and Human Genetics Center and Dr. Henry Lowe for the Center for Clinical Informatics). Some of the materials related to these Institutes and Strategic Centers can be found on our Strategic Planning Website at <http://medstrategicplan.stanford.edu/retreat05/>.

We also discussed the Neuroscience Institute at Stanford (NIS) at our Executive Committee on Friday April 1st. Dr. Mobley reviewed the rationale for the Institute. The key elements of this rationale are that disorders of the nervous system are devastating and increasingly common; that we are learning to decipher disease mechanisms, encouraging prospects for effective new treatments; but that a variety of factors combine to slow the pace of applying the benefits of research to patient care. As a result, a new model is needed to accelerate research leading to treatments. This rationale gives rise to the vision and mission of the NIS: to relieve human suffering that arises from the dysfunction of the nervous system and to create a new culture to realize a bold vision for research, treatment, and teaching that arises from the synergy of diverse disciplines focused on the nervous system.

Dr. Mobley updated the Executive Committee on the progress he and his colleagues have made over the past year in the development of the Institute. They have made major strides in building the NIS community, identifying internal leaders, initiating fundraising efforts, securing external support, planning for meeting the Institute's space needs, and starting new scientific collaborations. He concluded by describing a few of the exciting recent research outcomes in laboratories associated with the Institute. The Executive Committee shared Dr. Mobley's enthusiasm for the scientific advances coming out of the Institute and applauded the progress that has been made to date.

Message to the Search Committee for the Next Chair of Medicine and Further Thoughts on "Charting the Future"

In my February 7th Dean's Newsletter I raised questions about the current and future organization of academic medical centers and schools of medicine. In doing so, I asked our school leaders and faculty to consider how they might construct an academic medical center if they were starting from a clean slate in 2005 and wanted to develop programs that would foster the future of medical education, research and patient care. I raised these questions in part because I believe it is incumbent on us, as the current stewards of Stanford, to reflect on how we can assure that our medical school and medical center continue to achieve excellence in the years ahead and serve as a role model for research-intensive schools of medicine in the 21st century.

In raising these questions— and in being purposefully provocative — I knew, and indeed hoped, that my comments would provoke discussion and creative thinking among our faculty and department chairs. To further the discussion, over the past several weeks I met in smaller groups with our basic and clinical science department chairs and I received correspondence from a number of faculty offering their input and recommendations. A number of opinions were expressed — some strongly — that offered different perspectives, points of view and biases. It is notable that even those who protested the prospect of changes in our current organization did acknowledge that some aspects of our current organization are not optimal and will likely change in the years, or decades, ahead. The question is when and how Stanford should participate in — or lead - that change.

Among the reasons for raising this topic at this time is the fact that we have several department chair searches that are ongoing or are being initiated. I felt it particularly important to set some definitions and boundaries now, so that we could more optimally define the scope of responsibilities and qualities that should characterize future leaders.

On Friday, March 25th, I met with the newly appointed Search Committee for the next Chair of the Department of Medicine and took the opportunity to offer some additional perspective and conclusions emanating from my discussions and thinking. The Search Committee is co-chaired by Drs Harvey Cohen and Gary Glazer and includes as members Dr. Mark Davis, Mr. John De Caro, Drs Scott Delp, Carlos Esquivel, Michael Jacobs, Michael Longaker, Bill Mobley, Daria Mochly-Rosen, Rick Meyers, Mike Peterson, Robbie Robbins, Alan Schatzberg, Matt Scott, Lucy Shapiro, and Irv Weissman. Ms Dee Morris and Ms Rebecca Trumbull are staffing this committee.

In charging the Committee, I began by providing a brief summary of the history of academic medical centers and schools of medicine. This is a relatively brief history, since the earliest academic medical center embracing basic and clinical science, Johns Hopkins, was established in 1893. Throughout the subsequent decades, there have been numerous organizational structures that have varied in as many, or more, ways as they have been similar. Some characteristics have remained consistent; for example, the split between basic and clinical departments has been a common thread throughout most centers. About 40 years ago significant changes in the size and scope of academic medical centers and their full time faculty occurred with the introduction of Medicare and the expansion of the National Institutes of Health. Today, academic medical centers and schools have many differences, but they also share some common features, one of which is the Department of Medicine.

Departments of Medicine have historically been and are often today loose amalgamations of a wide variety of disciplines. Differing cultures and changing dynamics both within medicine and within individual institutions have led to a variety of structures for departments of medicine, with inclusion of some disciplines, exclusion of others, and varying sizes, focus and scope. For example, some institutions have departments of medicine as large as 800-1000 faculty, which is larger than the entire school of medicine at Stanford. In one institution, neurology or dermatology might be a part of the department while oncology is not; in another institution it could just as easily be the other way around. Ultimately, each department of medicine is distinctive and is often the result of institution-specific changes and evolution, including, not infrequently, past leadership and institutional culture and mission.

While departments of medicine were often formed as an aggregate of distinct disciplines and subspecialties that became organized around divisions, surgery followed a different pathway. It disaggregated based on the argument that this fostered a more successful focus and development of specific surgical specialties (e.g., urology, neurosurgery, orthopedic surgery, otolaryngology, etc). Basic science departments have also evolved. Some schools have large departments and others smaller groupings, with the names of the

departments changing as new scientific disciplines arose but also with considerable overlap in the type of research being conducted despite differences in name.

Against this backdrop of the fluidity of the form and shape of medical schools and of departments of medicine in particular, I also focused in my remarks on Stanford's recent history. Prior to Stanford's move to Palo Alto in 1959, the preclinical activity of the medical school was located on the Palo Alto campus but the clinical programs and training took place in San Francisco. When the decision was made to bring the basic and clinical sciences together on the Stanford campus, many of the most senior and experienced clinical faculty stayed in San Francisco, resulting in an initially unbalanced configuration of the school. The historical emphasis and strength in the basic sciences at Stanford have led to one of the very best basic science programs in the world. This achievement, however, has been accompanied by clinical programs that initially lagged in their growth and development. It also resulted in the perception that clinical medicine was undervalued and, to an extent, less important to the school and university.

While underscoring the fundamental importance of the departmental structure as the foundation of the School, I shared some of my views about the future and about the opportunities for a new kind of interrelationship between the basic sciences and clinical care. A change is in the air throughout medicine and the delivery of health care, and Stanford could be at the forefront of how an institution reshapes itself to meet those new challenges. New paradigms for both MD and PhD education are unfolding, and Stanford could be the leader in developing those, just as we have begun to do with our new curriculum and the unfolding plans for graduate education. While maintaining the current strong basic science research departmental structure, I would like to encourage further connections and collaborations between the basic and clinical sciences.

I believe that Stanford should be at the forefront of crafting this new agenda, rather than passively watching it unfold elsewhere. Moreover I believe that as a small research-intensive school of medicine on a single campus, Stanford has a unique opportunity to craft the future of academic medicine. For example, the newly created Stanford Institutes of Medicine begin to provide the fundamental building blocks of this new structure, which will promote a greater interdisciplinary approach across all missions within the School of Medicine. The new strategic centers will serve as additional connecting points to these greater interdisciplinary endeavors. As the institutes and strategic centers grow and develop, the basic and clinical departments will have a key role in interacting and working collaboratively with them to achieve these goals.

In order to foster and provoke discussion about how we should approach the future, I specifically challenged our community to reflect on how we should change or re-invent ourselves. Not surprisingly, reactions to this challenge have varied, depending on a number of factors, including whether the individual is a junior or senior faculty member and whether the person is a chair or not.

Having said that, I also acknowledge that the school has undergone a tremendous amount of change in the past four years during which I have been dean, which themselves

followed the tremendous upheavals that took place in the antecedent merger and demerger with UCSF. In light of this recent history, I have been reflecting further on the desirability of increasing the pace of new change versus continuing the rate of change already underway following the introduction of our new models for education and the development of the Stanford Institutes of Medicine. Based on the feedback I have received I have come to the conclusion that a longer, visionary view of the future is more appropriate than more immediate organizational changes within the clinical departments. Accordingly, and specific to the department of medicine or pediatrics, I do not envision moves of clinical divisions outside the current home department. Nor do I plan other alignments of extant departments (e.g., neurology and neurosurgery).

That said, I do believe that much greater and more collaborative and cooperative interdisciplinary and interdepartmental program development is essential. It is my hope that the new funds flow model will help to foster that (see http://deansnewsletter.stanford.edu/archive/02_22_05.html) by breaking down some of the financial disincentives to joint program planning. At the same time, I do want to challenge each of our departments and divisions to critically examine how they are currently working and how new alignments might foster novel models for education, research and patient care. Even without moving divisions or departments together into new departments (e.g., cardiology, cardiovascular surgery, vascular surgery, interventional radiology) I want to charge those same divisions and departments to develop new virtual connections that enhance opportunities for education, research and patient care.

These expectations help shape the important characteristics I asked the Search Committee to consider as they begin evaluating candidates for the chair of the Department of Medicine. Among the characteristics I underscored as important to me are the following, which will be provided to each candidate:

1. Leadership skills and the *vision to shape the future rather than recreate the past*; unusual and unique leadership, creative thinker, forward-thinking;
2. Understands complexity of the world of academic medicine;
3. Stellar communication skills with range of constituencies, including basic scientists, clinicians, educators, the hospitals, broader university community, and the broader community beyond Stanford;
4. A known record of accomplishment as a scholar and investigator;
5. Dedication to clinical excellence that is placed on par with that of research excellence;
6. Willingness to engage in discourse about the future of medicine;
7. Willingness to have department work collaboratively with and be supportive of the Stanford Institutes of Medicine;
8. Willingness to work constructively and collaboratively with basic and clinical department leaders and faculty;
9. Ability to foster a sense of community within the department;
10. Ability to bring a sense of value and self-esteem to the department in difficult times and to bring value to the community.

In response to a question about how the departments and institutes might work together, I indicated that I envision the departments as the foundation of the school with institutes providing opportunities for broad interdepartmental and cross-school collaboration around key disciplines that are closely aligned to clinical centers of excellence within each of our affiliated hospitals. Both department chairs and institute directors need to be visionary leaders willing to make Stanford much greater than the sum of its parts.

It is my hope and intention that we should continue to challenge who we are and how we can foster the greatest level of excellence, innovation and discovery. While this can sometimes be unsettling, in the long run it will help Stanford to remain fresh, exciting and outstanding.

US News & World Report Rankings: Advocacy But...

During my time at Stanford (which reached four years on April 2nd!) I have been having an ongoing debate with US News & World Reports regarding the methodology they have employed to rank medical schools. I have been addressing the professional and not the graduate programs. Indeed, the graduate programs within the School of Medicine rank at the top of the list.

One of the major concerns that I have expressed to USNWR (and which I have discussed in this Newsletter) is that the ranking used for medical schools is unduly influenced by the size of the school rather than its quality. That is because one of the most important factors USNWR has employed in its ranking score is the total amount of NIH funding. Because Stanford is among the smallest of the research-intensive schools of medicine it really can't compete in total NIH funding compared to schools like Harvard, Hopkins, Penn and even UCSF, which are all considerably larger in their number of full-time faculty. So, my argument has been that USNWR should also include the amount of NIH dollars per fulltime faculty member as a better measure of faculty quality, rather than just size. After three years of annual visits to the editors at USNWR and many letters and communications, I was successful some months ago in getting agreement that this year's ranking data would include NIH research grant dollars per full-time faculty member. And indeed, in the rankings of medical schools that USNWR published on Friday April 1st (and here I am not fooling), they did include – for the first time – a column reflecting the per faculty NIH research dollars. Stanford is #1 on that score – nearly twice as high as Harvard (amazing how loyalties shift). So, in that regard, my advocacy worked and I do thank the editors at USNWR for their willingness to make this adaptation. That is the good news.

More disappointing is that despite the inclusion of per faculty NIH funding, our rank remained #8 in this years USNWR ranking. The reason still seems to be the size factor. While the editors did include the per faculty NIH funding, it was only 2/3 of the overall NIH score. Clearly the total NIH score impacts the outcome in favor of those larger schools that have significantly higher total NIH funding. But at least the data is clearer and the inclusion of the funding per faculty member offers a beginning counter to the size factor.

Clearly there is more advocacy work to be done, but at least the methodology is a bit more reflective of quality rather than simply size.

Seeing and Experiencing the Future of Medical Education

On Thursday evening March 31st the School of Medicine co-hosted a special event with Jerry Yang, Co-Founder and Chief Yahoo, Akiko Yamazaki, and Robert Bishop, Chairman and CEO of Silicon Graphics, Inc., entitled “The Future of Virtual Reality in Medicine”. The goal of this event was to highlight the way information technology and virtual reality are transforming the way we think about education and how they will impact on both how and where we educate and train students. We had the opportunity to witness the remarkable developments at SGI in virtual reality and to showcase some of the school’s ventures including “Anatomy Imaging of the Future” by Drs. Amy Ladd and Robert Chase and “High Tech Healing: Predicting Outcomes of Cardiovascular Interventions” by Drs. Charlie Taylor and Jeff Feinstein. Dr. Tom Krummel served as the host for the exhibitions. It was an incredible experience, and it offered a glimpse about how education, training and knowledge acquisition and dissemination will unfold during the 21st Century.

During this event we showcased out plans for the future Learning and Knowledge Center (LKC). This new facility will help transform the School of Medicine by providing state-of-the-art facilities for simulation and virtual reality in tandem with interactive small and large class rooms, a conference center and the digital library of the future that will become the School’s knowledge center. We envision that the LKC will provide the education home and hub for medical and graduate students, residents and fellows, faculty, continuing medical education and community events. When the 120,000 sq ft LKC is completed on the current site of the Fairchild Auditorium, it will open a new door for the Medical School to the University and especially to the Science and Engineering Quads. The LKC will be a showpiece for the School and University as well as a gateway to our community, locally and globally. This extraordinarily exciting facility will offer the opportunity for continuing collaboration with SGI, Yahoo and many other programs that have made Silicon Valley the center of the country and even the world for novel information technology development.

Considerable progress has been made on the detailed programming of the LKC, and we are now beginning presentations to the community to help raise the funds to bring it to life. We received wonderful endorsements from the attendees at The Future of Virtual Reality in Medicine event, which allows us to feel some optimism for our success. In addition to the wonderful presentations that were given by our faculty and the exceptional co-hosting by Bob Bishop, Jerry Yang and Akiko Yamazaki, I also want to thank Bruce Bingham, Michael Welsh, Dolly Patterson and our OMD colleagues who helped to make this program so successful. Our goal is to have the LKC completed by 2008. Accomplishing this important goal will require considerable work and effort, which I am absolutely committed to help lead.

Plans for a Visit with His Holiness the Dalai Lama

I am very pleased to announce that Tenzin Gyatso, the 14th Dalai Lama, Tibet's exiled leader and the spiritual leader of Tibetan Buddhism, will visit Stanford Nov. 4-5, 2005. He will make public appearances including a large-scale meditation and teaching event, a conversation about nonviolence and, most notable from my point of view, participation in a conference sponsored by the School of Medicine.

The conference will be a dialogue between the Dalai Lama and a group of distinguished scientists from Stanford and other major universities on the topic of "Craving, Suffering and Choice: Spiritual and Scientific Explorations of Human Experience." Participants will seek to identify common ground between Tibetan Buddhism and neuroscience, disciplines that use very different methods to understand how the mind works and how to treat its disorders. The Buddhists, with their 2,500-year-old tradition of introspective inquiry into the nature of the mind, are thought to have much to offer to neuroscience. Conversely, Western research tools and concepts may help to test the insights that come from Buddhist practice and better understand the mental states achieved through meditation. The goal for the conference is to establish a rich dialogue focused on problems that all of us experience.

A limited number of tickets will be available for the Dalai Lama's public appearances. One group of tickets will be available to Stanford faculty, staff and students between May 30 and June 12. Another will become available to the public beginning June 13. Complete information about ordering tickets, event times and other details about the Dalai Lama's visit, including descriptions of individual events, can be found online beginning April 4 on a website created for the Dalai Lama's visit at <http://dalailama.stanford.edu>. Because demand for tickets is expected to far exceed the supply, all public appearances by the Dalai Lama will be broadcast live on the website.

Other sponsors and co-sponsors of the visit of the Dalai Lama, in addition to the School of Medicine, are the Office for Religious Life, the Aurora Forum, and the Stanford Center for Buddhist Studies - Asian Religions & Cultures (ARC) Initiative. This will be a wonderful opportunity for the Stanford community, and I want to thank everyone who is working to make it a success.

End of Life Discussion

On March 31st, the day of Terry Schiavo's death, the medical school, in conjunction with the Stanford Center on Ethics, held a forum on the ethical and legal issues raised by her case. David Magnus, Professor of Pediatrics, Medicine, and Philosophy and Director of the Stanford Center for Biomedical Ethics, and Debra Rhode, Ernest W. McFarland Professor of Law and Director of the Stanford Center on Ethics, presented their views. They then fielded questions from the audience. The room was overflowing with participants, including members of the media, illustrating how much the Schiavo case has concerned both the medical community and the population more generally. In their presentations, both Professors Magnus and Rhode felt the ethical and legal issues had

been handled appropriately by the judicial system. In conformation with Florida law, the key factor in the judicial decisions was the patient's wishes, as represented by her husband and other witnesses. The principal of patient autonomy in decision-making was considered paramount. However, both Professors Magnus and Rhode acknowledged the "ambiguity" in the boundaries between individual decision-making and government intervention. Questions from the audience were provocative; they challenged the physicians and politicians who participated in the case, as well as the judicial decision itself. On the issue of written directives, both professors maintained that no piece of paper could replace frank, thorough discussions of one's wishes with loved ones.

The forum stimulated important discussion. We plan to work with the Stanford Center on Ethics to present further such forums to the medical community in the future on other ethical topics.

Continuing Stem Cell Debate: Update from Ryan Adesnik

During the past weeks there has been considerable debate and discussion about stem cell research. Accordingly I asked Ryan Adesnik, Stanford Director of Federal Relations, to offer comments on some of the issues unfolding at both the federal and state level regarding stem cell research. His comments follow:

“In the last few weeks you may have read about new developments impacting stem cell research policy in Washington, DC, and Sacramento.

Last week in Washington, the House Republican Leadership agreed to allow a vote on legislation that would loosen Bush Administration restrictions that limit federal funding to research on stem cell lines in existence prior to August 9, 2001. As many of you know, this issue is extremely important since the vast majority of the approved cell lines have proven to be unsuitable for scientific research. Last year, after a vigorous advocacy effort, 206 members of the House and 58 Senators signed a letter to the President requesting that he broaden this funding policy.

The new bill, introduced by Rep. Mike Castle (R-De) and Rep. Diane DeGette (D-CO), would specifically allow federal funding for research performed on stem cells derived from leftover human embryos from fertility clinics. Senators Arlen Specter (R-PA), and Tom Harkin (D-IA) have introduced similar legislation in the Senate. We will work closely with our peer institutions and patient advocacy groups as part of a comprehensive advocacy effort to gain passage of the bill. While this movement is a positive initial step, the legislation is a long way from being signed into law. The House leadership has agreed to a vote in the coming months, so people who follow this issue should expect a lot of twists and turns before this legislation is debated on the House floor.

It is important to note that the Castle/DeGette legislation is silent on the more contentious issue of using somatic cell nuclear transfer (SCNT) to develop additional stem cell lines. While the scientific community is united in its opposition to reproductive cloning, it is vital to protect the ability to perform

SCNT since this technique has so much promise to help us understand and treat disease. Unfortunately, Rep. David Weldon (R-FL) and Senator Sam Brownback (R-KS) have again introduced legislation that would impose significant criminal penalties on scientists who perform research that involves SCNT. It is important to recall that in the last Congress, the House passed the Weldon bill. However, stem cell supporters, including Specter and Senator Orrin Hatch (R-UT), have consistently blocked the Brownback bill in the Senate.

Congressional leaders who support stem cell research have chosen to address the issues of SCNT and expanded funding in two separate pieces of legislation. Legislation that would outlaw reproductive cloning, but specifically allow SCNT has been introduced in the House. Senator Dianne Feinstein (D-CA) and Senator Hatch will soon introduce a similar bill in the Senate. We will be active in support of the Hatch/Feinstein bill and will continue to provide updates as things progress.

In addition to all the activity in Washington regarding stem research, there has also been a lot of action in Sacramento with regard to Proposition 71. State Senator Deborah Ortiz, has joined with conservative Senator George Runner to introduce a Constitutional Amendment that would require: 1) that grant review meetings be subject to the state's open meeting laws; 2) that members of the Independent Citizen's Oversight Committee (ICOC) adhere to NIH conflict of interest standards; and 3) that the state receive revenues from IP agreement generated from Prop 71 funded grants in an amount that would repay the costs the state incurred by issuing the bonds. This proposed Constitutional Amendment requires a 2/3 vote of the California State Assembly and Senate, followed by approval at the ballot box.

Senators Ortiz and Runner have also drafted legislation that proposes a three-year moratorium on the use of hormones utilized to produce multiple eggs for research purposes.

We will be following these issues as they progress. If you have any questions in the interim please feel free to contact Ryan Adesnik in Government Relations at 5-3322; radesnik@stanford.edu.

Upcoming Program in Music and Medicine

Dr. Audrey Shafer has informed me that on May 2 at 5:00 pm at Fairchild Auditorium there will be an interactive concert and lecture sponsored by the Arts, Humanities and Medicine Program and by the Stanford Center for Biomedical Ethics. The program is called "Music and Medicine: The Art of Listening" and will feature well known music commentator and composer Robert Kapilow and the renowned ensemble-in-residence at Stanford, the St. Lawrence String Quartet. For further information, contact Dr. Shafer at ashafer@stanford.edu.

Honors and Awards

HHMI Investigators: On March 21st the Howard Hughes Medical Institute announced the selection of 43 “of the nation’s most promising biomedical scientists as new HHMI investigators.” The 43 new HHMI Investigators were selected from an applicant pool of more than 300 nominees and include 32 men and 11 women from 31 institutions. Stanford University had the opportunity to nominate 3 scientists and of note, all three were selected – the highest proportion from any university or biomedical research institute. The three new HHMI Investigators from Stanford include:

- **K. Chris Garcia**, Department of Microbiology and Immunology, School of Medicine
- **Liqun Luo**, Department of Biological Sciences, School of Humanities & Sciences
- **Steve Quake**, Department of Bioengineering, Schools of Engineering and Medicine

Congratulations to all – and to Stanford!

HHMI Student Training Fellowships: In addition to the HHMI Investigator Awards, several of our medical students have received notification of HHMI Student Training Fellowships. We are very pleased about this as well. To date the selected students are:

- Simon Hanft, SMS 4
- Tyler Hillman, SMS 1
- Yashar Kalani, SMS 1

Congratulations to all.

Burroughs Wellcome Fund (BWF) Clinical Scientist Awards in Translational Research: This award is one of the most prestigious and important awards for clinical and translational investigation. Per the BWF, “the program is intended to help reduce award recipients’ general clinical responsibilities, freeing more time for them to pursue the vital link between basic and clinical research. Most importantly, the program aims to identify and reward proven mentors and to increase their capacity to train the next generation of investigators skilled in translational research. In this way, BWF hopes to catalyze the development of a cadre of experienced physician-scientists critically positioned to bridge the gap between bench and bedside.” To do this, the BWF Clinical Scientist Award in Translational Research provides \$750,000 over a period of five years (\$150,000 per year). According to BWF, “the awards are intended to give recipients the freedom and flexibility to explore fundamental scientific questions, to apply the resulting knowledge at the bedside, and to bring insights from the clinical setting back to the laboratory for further exploration. BWF hopes these efforts will lead to better understanding of the mechanisms of disease as well as to new methods of diagnosing, treating, and preventing disease.” This year BWF made 7 awards –

and quite wonderfully, two of them were to Stanford faculty – both in the Department of Medicine. These two awardees are:

- **Dr. Jeffrey Glenn**, Assistant Professor of Medicine (Gastroenterology and Hepatology)
Project: *Hepatitis C virus: from molecular virology to effective pharmacologic eradication*
- **Dr. Dean Felsher**, Assistant Professor of Medicine (Oncology) and of Pathology.
Project: Pre-clinical validation of g-quadruplex drugs that target MYC to treat cancer

Please join me in congratulating Drs. Glenn and Felsher.

Dr. Paul Berg, Cahill Professor in Cancer Research, Emeritus will receive the 2005 Biotechnology Heritage Award from the Chemical Heritage Foundation and Biotechnology Industry Organization in June at the BIO 2005 meeting in Philadelphia. In announcing this award, Arnold Thackray, president of CHF noted, “Paul Berg’s scientific creativity underlies our knowledge of the genetics of all living things, and our ability to understand the functioning of cells from any species. His work was instrumental in setting the stage for today’s and tomorrow’s exciting advances in biotechnology.”

Congratulations – once again – to Dr. Berg.

Dr. Michael Link, Lydia J. Lee Professor in Pediatric Cancer, was honored on Tuesday March 22nd at a dinner celebrating his being named the first incumbent of the Lydia J. Lee Professor in Pediatric Oncology. This professorship is particularly special in that it is named in honor of a child who is now a long-term survivor of childhood cancer – and who was also a patient who Dr. Link cared for as her physician. During the past several decades there has been incredible progress in the treatment of pediatric malignancies – to the point where survival is now observed in the vast majority of children diagnosed with cancer. This is a testament to research as well as the compassionate and sensitive care that is conducted by physicians like Dr. Link.

Dr. Tony Wyss-Coray, Assistant Professor of Neurology and Neurological Sciences, has been named the first recipient of the John Douglas French Alzheimer's Foundation Distinguished Research Scholar Award. This Foundation is a non-profit public charity that provides funding to outstanding investigators in Alzheimer's disease. This award is considered to be among the most prestigious in this field. Congratulations to Dr. Wyss-Coray.

Appointments and Promotions

- **Christopher Contag** has been appointed to Associate Professor of Pediatrics and of Microbiology and Immunology, effective 4/01/2005.
- **Robert Robbins** has been promoted to Professor of Cardiothoracic Surgery, effective 4/01/2005.
- **Theodore Sectish** has been appointed to Associate Professor of Pediatrics, effective 4/01/2005.

Dean's Newsletter

April 18, 2005

Further Discussions with Departmental Leaders and Faculty Regarding the Future

Since my comments in the April 4th Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/04_04_05.html#2) regarding the future of academic medicine I have met with the faculty and staff leaders of the Department of Medicine and the faculty of the Departments of Neurology and Neurosurgery. We continued discussions about the future of departments and Institutes at Stanford, and most importantly, I listened to the views, concerns and suggestions of faculty and staff. At both meetings I reiterated my perspective that the future will require greater interdisciplinary and more interdepartmental alignments and collaborations in order to create new and exciting opportunities. I also affirmed that this was an opportunity for Stanford to be a national leader and to set and create new standards and expectations. That said, I also confirmed that we will work to achieve this by sustaining, and wherever possible strengthening, departmental functions and value. However, I added that I will expect that departments will seek to re-invent themselves from within, and, equally importantly, to foster more interactions and collaborations to enhance our missions in education, research and patient care. I further affirmed that we will seek to do this without major reorganizations within or among departments and that we will also look for strong and visionary leaders to help shape our broader institutional agenda for the future.

Based on discussions at and outside of these meetings, I am satisfied that our recent discussions about the future of academic medical centers have heightened interest, awareness and thoughtfulness about how we can work collaboratively to make Stanford an even better role model among research-intensive schools of medicine.

Update on the California Institute for Regenerative Medicine (CIRM)

Progress continues in establishing the California Institute for Regenerative Medicine. While the lay press has frequently commented on the problems and deficits of the CIRM and its Independent Citizens Oversight Committee, on which I serve, I am strongly persuaded that considerable progress is in fact being made. Indeed, the 29 member ICOC has been working quite hard to create the infrastructure that will enable the CIRM to begin funding, at least fellowship training grants, by late summer to early fall, 2005.

In the past couple of months, the ICOC has appointed an Interim President, Dr. Zach Hall, who is also working diligently to develop the infrastructure to support the grant making and policy programs of the CIRM. He is recruiting terrific leaders from around the state and country to help launch this effort and I am encouraged by the progress to date.

In the next months a number of ICOC committees will be completing important activities that will have a further impact on the CIRM. The Search Committee for the permanent president of the CIRM (on which I serve) is working intensely and on a remarkably accelerated timeline. In conjunction with the selected search firm, Spencer Stuart, more than 600 inquiries were sent to leading scientists and institutions across the country. The response has been exceptional and the Search Committee is already developing a short list of candidates for further evaluation. While this process must of course be highly confidential, I can say that I am extremely encouraged by the quality of the candidates who are being considered.

The ICOC is also identifying leading scientists and investigators, almost exclusively outside of California, who will serve on the scientific grant review boards. Again, a remarkable list of individuals has been compiled from recommendations received from both the scientific and public communities. This list has been vetted further and the Grants Committee (on which I also serve) is making contact with individuals to determine their willingness to serve. Once again I can say that the quality of the individuals being considered – and who have in turn expressed interest – is outstanding.

In addition, the ICOC Standards Committee is addressing the policies and procedures that will govern stem cell research. A National Academy of Sciences report due in April or May proposing guidelines for stem cell research will be an important resource for this committee. In addition, the Site Selection Committee will issue its report in early May regarding the headquarters for the CIRM. Clearly these are all positive advances.

At the same time there are a number of challenging issues facing the CIRM. Among these are various law suits and legislative bills challenging the ability of the CIRM to carry out its work on numerous fronts (intellectual property, conflict of interest, ability to fund research, and egg procurement among others). While it is understandable that different points of view are being expressed, it would be most unfortunate if these activities deterred the CIRM from its mandate to conduct important research in stem cell biology and regenerative medicine.

One of the issues continuing to receive attention is the perceived need for all of CIRM activities to take place in a completely open and public setting. Certainly the Bagley-Keene Act requires that all meetings (including conference calls) occur in an open and public setting. The ICOC supports that. However, some of the public continues to argue (as do editorials in newspapers like the Sacramento Bee) that grant reviews and even the presidential search committee take place in open settings. We have tried to be clear on why this would violate the process of peer review and, in the case of a high level search, almost surely mean that candidates would be unwilling to be considered, but to no real

avail. I am fully convinced that successful grant reviews require confidentiality, both for the investigator submitting a proposal and for the scientists carrying out the review. Despite considerable effort to explain why this is so important, including discussions with editorial boards in which I have personally participated, the counter view remains. While I certainly respect the right of individuals – and newspaper editorial boards – to disagree, I have full confidence in the peer review process as carried out by the NIH and virtually every non-profit foundation, and I believe that the CIRM should follow a similar confidential peer review process.

Challenges for the NIH and Academia

I have previously commented on some of the very significant issues impacting the NIH and, as a consequence, our academic medical centers. Of course one of the most disturbing is the deteriorating NIH budget, which, after several years of significant increases, is now facing funding shortfalls. This is due to the need to support multiyear grants and contracts and, most disturbingly, the significant decreases in the NIH budget appropriations during the past two years. The worrisome consequence of this is less funding for new and competing grants. I am very confident that our outstanding faculty will continue to compete well for whatever grant funds are available (Stanford is the top-ranked school in the nation in competitive NIH dollars per faculty member – see April 4th Dean's Newsletter – http://deansnewsletter.stanford.edu/archive/04_04_05.html#3). However, the difficulty for new young investigators to receive their initial RO1s and similar grants is a source of significant concern. Clearly we will need to monitor this carefully and do all we can to minimize the negative impact.

In tandem with the concerns about NIH funding is the fact that this once hallowed institution is under siege because of the conflict of interest infractions during the past year and, equally importantly, the rather dramatic over-reaction that the NIH imposed in response. I have also addressed this in recent Newsletters (see February 22 2005 edition - http://deansnewsletter.stanford.edu/archive/02_22_05.html#2). There is no question that clearly defined and universally followed conflict of interest regulations are essential to protect the integrity of investigators, institutions and the public trust. And, there is no question that some of the violations at the NIH reported in print media during the past year appear to have been egregious, they required swift and clear action. Indeed, I am quite sensitive to this matter, both because of the many years I spent as an intramural NIH investigator and because of my participation on the Blue Ribbon Panel that developed new guidelines for conflict of interest for the NIH just a year ago. Unfortunately, while my colleagues and I on the panel felt that we came forward with highly credible and manageable guidelines, the process rapidly become politicized. As a result, the NIH decided to develop more stringent restrictions on outside activities. These were followed just months ago by a one-year ban on all outside activities for NIH scientists.

This ban is creating considerable harm to the NIH, including the decision of a number of senior leaders and investigators to leave – and others not to come. Hopefully the NIH leadership will modify the very stringent restrictions that have been imposed, perhaps to

something closer to those of the Blue Ribbon Panel. The possibility that the current total ban might be modified is suggested from recent comments by the NIH leadership in the Washington Post and other public media. While the situation at the NIH is clearly different from that of academic medical centers, the unfolding events serve to remind all of us of the importance of exercising care and scrutiny in the surveillance and management of conflict of interest. I concur with the editorial comments by Drs. Richard Popp and Paul Yock in the April 6th issue of the Stanford Report (see also <http://med.stanford.edu/spotlight/index.html>). I also wish to underscore that it is incumbent on each faculty member to assure that she or he exercises full and complete disclosure and complies fully with any recommended oversight over potential or real conflicts of interest.

Conflict of interest issues also have relevance to the future organization of the NIH because of the “reauthorization” process slated to take place over the next year. While reauthorization in the past has not had major consequences, in this more politicized environment, and especially with the current shadow over the NIH, it is not beyond the realm of possibility that serious consequences could unfold, either inadvertently or directly. To help prepare for any exigencies that might result, Ryan Adesnik, Director of Federal Relations, and I asked the AAMC (Association of American Medical Colleges) to begin considering how we could work toward the most favorable outcomes of the reauthorization process. As a result, an Ad Hoc Work Group has been established through the AAMC that I am co-chairing with Dr. Bob Kelch from the University of Michigan. Last week we had our first conference call with a number of deans around the country. We alerted them to the risks at hand and the events that might unfold, and we defined steps we might take to do all we can to assure the future integrity of the NIH. I will share more about this with you in the months ahead.

On a more positive note, it appears that several NIH leaders are beginning to speak more openly about the current NIH limitations on funding embryonic stem cell research. Even NIH Director Elias Zerhouni has implied in recent testimony before Senators Harkin and Specter that he may advocate for a more engaged NIH position on stem cell research. I hope this is the beginning of a more enlightened NIH position. While we are fortunate in California to have future funding opportunities through the California Institute for Regenerative Medicine, I worry about the potential erosion of NIH funding if future research investments shift from the federal to the state sector. It is the NIH that has made the United States the unique and worldwide leader in biomedical research, so I hope it will continue to stand as the dominant supporter and funder of all biomedical research in the future.

Enhancing Clinical Research

I am pleased to report that the Stanford/Packard Clinical and Translational Research in Medicine (SPCTRM) will be formally launched in the near future, thanks to the efforts of Drs. Steve Alexander, Professor of Pediatrics and Director of the ACCESS Program, and Harry Greenberg, Senior Associate Dean for Research & Training, and Acting Co-chair, Department of Medicine. Considerable progress has been made during the past two years

in developing the key infrastructure components to help foster a robust clinical and translational program to support our faculty and help Stanford achieve its mission in *Translating Discoveries*. In addition, the innovative programs being developed by the Strategic Center for Clinical Informatics under the leadership of Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, and his colleagues will enhance SPCTRM.

Given the emphasis of the NIH Roadmap on translational research, such developments at Stanford are timely. The importance of clinical research and especially of training the next generation of students and postdoctoral trainees to understand and engage in clinical research was a topic for discussion at the recent Council of Dean's meeting that I attended on Sunday April 10th. It was noted that several task forces have addressed the importance of clinical research, including one sponsored by the AAMC (Association of American Medical Colleges) in 1999 as well as one initiated in the Fall of 2004. While the 1999 task force laid out a number of important goals for the education and training of clinical investigators as well as for the development and support of the infrastructure for conducting clinical research, it is not clear how well these recommendations were implemented.

A similar deficit appears to apply to a report produced in 2001 by a diverse group that included Stanford's Dr. Phyllis Gardner. This report offered strong recommendations for educating medical students about the scientific method underpinning traditional and non-traditional therapies and the ethics guiding clinical practice. Further, this committee recommended that students have a working knowledge of seminal clinical research findings and their application to patient care. In addition, they recommended that students be able to assess and critique the research findings published in major medical journals and know how to assess medical information. Although these and related goals are important and should be part of every student's learning repertoire, it has been widely acknowledged that most schools fall short of a formal didactic program of these important principles. At Stanford the principles governing clinical research are incorporated into a number of courses and there is a Scholarly Concentration devoted to clinical research – but it is clear that we can and should do more to foster knowledge and interest in this important area of medicine.

The need for additional emphasis on clinical research is highlighted by two important facts. First, there is a shrinking number of graduates pursuing careers in clinical research and second, a number of recent events have impacted the public trust regarding clinical research. With regard to the pipeline for clinical research, it has been estimated (albeit based on limited data) that only about 15% of the individuals who receive a K grant in clinical research actually make it to the point where they have two RO1 grants (a reasonable gold standard for career success). At the same time, data presented at the Council of Deans meeting underscored that individuals who enter clinical research have a high satisfaction with a career that combines patient care with the opportunity to generate knowledge that improves that care. However, it was acknowledged that the pressures and demands on such individuals are enormous. Further, in most academic centers, insufficient protected time is made available to carry out the expected clinical research,

and there are an inadequate number of truly knowledgeable mentors to guide the career development of junior faculty who seek a career in clinical research.

Dr. Bernard Schwetz, the Director of the Office for Human Research Protections, underscored to the Council of Deans the importance of learning how to conduct clinical research in a scientifically sound and valid matter. He noted that, particularly recently, the public trust in clinical research has been eroded. Surely a number of tragedies have contributed to this loss of trust (e.g., the gene therapy death at U Penn, the normal volunteer who died in a clinical trial on asthma at Johns Hopkins and, of course, the recent and widely reported cardiac deaths due to NSAIDs). The effects of these events has been compounded by assertions and perceptions of conflict of interest by physicians and investigators involved in carrying out the clinical trials. Of course this underscores the importance of conducting clinical studies with honesty, integrity, transparency and the highest ethical standards. It also underscores the importance of assuring that individuals involved in designing, conducting and reporting clinical trials have been well trained to carry out these tasks. Indeed it is incumbent on institutions to assure that these standards are met – both for investigators and for institutions.

One recent issue that is attracting considerable attention and debate relates to the question of clinical trial registries. The genesis for this comes from the concern by the public, regulatory agencies (including the FDA) and journal editors, that clinical research reports contain selected information and do not offer the full context of data to assure that therapeutic claims are justified. I have commented on this topic previously and have been working with the Institute of Medicine to craft a plan that will better align the various constituents involved in clinical research and that, most importantly will earn the public trust. We are planning a public meeting on this issue at the Health Science Policy Board of the IOM at the end of June to further address this important topic. I will keep you apprised of the outcome of these proceedings.

Progress in Bio-X and Bioengineering

On April 14-15th, the Stanford Advisory Council on Interdisciplinary Biosciences, which is comprised of leading figures from industry (including biotechnology and information technology) as well as venture capitalists, heard updates on the progress being made in Bio-X and Bioengineering. Dr. Scott Delp, Chair of the Department of Bioengineering, noted that some 55 departments and more than 280 faculty from at least four schools at Stanford participate in BioX. Since its faculty-initiated inception and the opening of the Clark Center in the summer of 2003, a series of themes have emerged that organize faculty into various networks. These include biocomputation, genomics/proteomics, biophysics, chemical biology, brain/behavior, regenerative medicine, imaging and biodesign. The Bio-X Graduate Student Fellowships, Postdoctoral Fellowships, Innovation Awards and a number of educational programs have complemented these efforts. Notably, on March 25th an exciting symposium, “Watching Life” was held in the Fairchild Auditorium (see below) and in tandem, another program entitled “Talks in English” extend the reach of Bio-X to a broad and very interested community.

Important progress is also being made in the new Bioengineering Department, which is unique by its joint placement in the Schools of Engineering and Medicine. The department is now admitting its second class of graduate students. More than 360 highly qualified students applied for less than 20 positions. Equally notable, approximately 80% of the students offered acceptance are choosing Stanford over peer institutions like UC-Berkeley, Cal Tech, MIT, Michigan, etc. This surely reflects the exciting community of excellence that is beginning to emerge in the department – evidenced also by the outstanding faculty recruitments, new core curriculum, and nascent evidence of successful faculty competition for major center grants. The latter include a training grant in regenerative medicine (Dr. Michael Longaker, PI), a training grant in biomedical computation (Dr. Russ Altman, PI) and the successful competition to be a Center for Biomedical Computation (Drs. Russ Altman and Scott Delp, Co-PIs), the latter being one of only four such centers in the nation. These early achievements provide some assurance that the department will achieve its goal of being a “top 5 department in 5 years and the number 1 department of bioengineering in 10 years.” With the leadership of Drs Delp and Yock, the excellent faculty joining the department and the superb students and fellows being selected, this goal surely seems achievable.

Dr. Paul Yock, Co-Chair of the Department of Bioengineering, described how the programs in BioX relate to the four Stanford Institutes of Medicine. These relationships provide a unique opportunity to engage a broad array of faculty and students into both thematic areas (see above) and important diseases and medical disciplines. The resulting interactions will further promote innovations, technology development and the opportunity to translate discoveries to improve the health of adults and children locally, nationally and globally.

We are clearly at the early days of interdisciplinary research and education , but there is little doubt that the efforts underway at Stanford will make us the leader in this important field. In addition to our institutional efforts, you may also be interested in reading more about the emerging experiences in interdisciplinary research. I would recommend the recent report published by the National Academy of Sciences entitled, Facilitating Interdisciplinary Research (<http://www.nap.edu/catalog/11153.html>).

Watching Life

On March 25th and 26th Stanford’s Bio-X Program celebrated the culmination of 400 years of imaging at their first large annual symposium, “Watching Life.” The Symposium was organized by Drs. Matthew Scott, Professor of Developmental Biology and Genetics and Chair of the BioX Leadership Council and Sam Gambhir, Director, Molecular Imaging Program at Stanford (MIPS) and Professor of Radiology, and was sponsored by the Bio-X Program, the Stanford Molecular Imaging Program, and the Stanford Beckman Center for Molecular and Genetic Medicine.

The symposium, held at Fairchild Auditorium and the James H. Clark Center, brought together nine of the world’s leading scientists in the field of imaging to present and discuss imaging at different scales of life. Over 420 attendees listened to presentations ranging from imaging intact cells to imaging cells in small organisms to human clinical

studies. The presenters covered new types of microscopy, diagnostic imaging, engineering, chemistry, medical bioethics and clinical imaging of human brain addiction. Learning about all scales of imaging is important in bridging the different ways scientists observe biological processes.

Following the scientific presentations, 49 posters exhibited some of the tremendously exciting research being conducted at Stanford. The poster session provided great opportunity for Stanford students and postdoctoral fellows to meet each other, the symposium's world leading speakers, and the attendees from industry. The workshop on Saturday at the Clark Auditorium was attended by over 120 of Stanford's faculty, students and postdoctoral fellows and concentrated on the technical aspects of imaging.

The symposium, the poster session and the workshop were all open to the public. The events were very well attended. The Speakers Dinner was attended by about thirty of Stanford's imaging specialists, and provided a fantastic environment for exchanging ideas. Bio-X will continue to sponsor annual symposia on topics in multi-disciplinary biosciences for the benefit of both the Stanford community and visitors from elsewhere.

Stanford in New York

During the last several months members of the School of Medicine have been participating in major Stanford University events around the country. These have included appearances in San Diego, San Francisco, and London and, on April 16th, New York. Our specific charge was to host a plenary panel on stem cell research and medicine and I was pleased to be joined by an outstanding group of panelists including Drs Paul Berg, Irv Weissman, Mary Lake Polan and Hank Greeley. We had a far-ranging discussion that began with the fundamentals of stem cell biology and regenerative medicine. We addressed the extraordinary opportunities we believe will flow from research in this area and how Stanford will help lead that effort. The discussion included the controversies surrounding stem cell research and egg procurement as well as some of the legal and moral issues that impact this important new area. Our panel had the opportunity to address important and challenging issues. It is incredibly important that we provide as much public information and education about this extremely important area of bioscience and medicine as possible, and I am very appreciative that the University leadership given us the opportunity to do so.

Stanford Postdoctoral Fellows Meeting

On Thursday April 14th the Stanford University Postdoctoral Fellows Organization, led this year by Drs. Adriana Parra and Joyce Furfaro, met to review areas of progress and challenge. I am pleased to say that Stanford Postdocs have played a key role in helping to foster and develop support programs at Stanford and have taken a leadership role nationally as part of the National Postdoctoral Association. During the past year the SUPD has continued to make progress in working with the university leadership to improve the health and dental benefits for postdoctoral fellows, including access to Stanford faculty physicians. Other advances have been the initiation of the Career Center

led by Michael Alvarez and the appointment of Chequeta Allen as the Assistant Dean for Postdoctoral Fellows.

Without question postdoctoral fellows represent one of the most important and significant assets at Stanford, and I am pleased to note the continued progress being made in providing support that improves their Stanford experience.

Call for Nominations

The Albion Walter Hewlett Award was developed by the Department of Medicine as a recurring award to honor an extraordinary physician with ties to Stanford. Nominees are welcome from all departments and are not confined to the Department of Medicine. The award committee invites your nomination for a possible award presentation in 2005. Nominees should be from among those living who have made a substantial investment in Stanford (past or present students, house officers, fellows or faculty) and who have consistently, over decades, demonstrated the exemplary combination of a scientific approach to medicine and sensitivity to patients. They should be consummate physicians and role models for future academicians in medicine. Their work should be well known at least at Stanford and, optimally, nationally. Deadline for nominations is due on May 1st. For more information please check out the website at <http://medicine.stanford.edu/hewlett/>.

Upcoming Events of Interest

I want to call your attention to two upcoming events that promise to be of great interest to our community.

MEDICINE and the MUSE: An Arts, Humanities and Medicine Symposium, Thursday April 21, 2005, 5 pm Cantor Arts Center Auditorium, Stanford University. All are welcome. This event is free and open to the public and will include presentations, music and an art exhibit by Stanford medical students. The keynote speaker will be David B. Morris, PhD. He will speak on "Pain & Narrative: Where does it hurt?" Dr. Morris is University Professor, University of Virginia, and author of *The Culture of Pain; Illness and Culture in the Postmodern Age*. A reception will follow at 7 pm. This event is supported by The Osher Foundation, The Vera M. Wall Center at Stanford, and Helen and Peter Bing. Sponsors include the Biomedical Ethics and Medical Humanities Scholarly Concentration Arts, the Humanities and Medicine Program, the Stanford Center for Biomedical Ethics, and the Iris & B. Gerald Cantor Center for Visual Arts at Stanford University

MUSIC & MEDICINE: The Art of Listening, An Interactive Concert and Lecture by Robert Kapilow and the St. Lawrence String Quartet, Monday May 2, 2005, 5pm Fairchild Auditorium. This event is about using music to explore the practice of medicine: communication, teamwork, focus & the human condition. It is free and open to the public, and a reception will follow at 6 p.m. Composer Robert Kapilow is music commentator for NPR and host for Lincoln Center's 'Great Performers' concert series.

The St. Lawrence String Quartet is an internationally-renowned ensemble-in-residence at Stanford. This event is supported by The William and Flora Hewlett Foundation; The Office of the Dean, School of Medicine; Office of the Dean, School of Humanities & Sciences; The Office of the President; Stanford Music Department; and The Vera M. Wall Center at Stanford. It is sponsored by the Arts, Humanities and Medicine Program and the Stanford Center for Biomedical Ethics.

If you have questions about these events, please be in touch with Dr. Audrey Shafer at ashafer@stanford.edu.

Events

- ***Thanks to Dr. Judy Swain:*** On Tuesday afternoon April 5th, faculty gathered to thank Dr. Judy Swain for her eight years of leadership in the Department of Medicine. During that time important accomplishments were achieved including significant improvements in the quality of residents admitted to the internal medicine residence program and the increased interest of these residents in careers as physician scientists; the recruitment of outstanding junior faculty, a number of whom are already being acknowledged for their accomplishments as physician-scientists; growth in a number of clinical programs; and a dramatic improvement in performance based clinical activity and the financial solvency and success of the department. In addition to her leadership of the department, Dr. Swain assumed a number of important leadership roles in the university including serving as chair of the Advisory Board and most recently a committee on the professoriate.
- ***Community Lecture Series Continues:*** Our extremely popular evening series that provides opportunities for faculty leaders to present exciting new areas of Stanford Medicine to our neighboring communities continues. On April 6th, Dr. Gary Glazer, Professor and Chair of the Department of Radiology, spoke about the fascinating changes that have occurred in the field of imaging, from its inception, to its current and future states. It is remarkable to witness the progress that has taken place and to anticipate the further evolution of this field, due to computer simulation, processing of large data bases, and the burgeoning field of molecular imaging.. This has been an area where Stanford has excelled. Thanks to Dr. Glazer's leadership, we have assembled one of the very best faculty in the world, and they are contributing significantly to new discoveries and innovations.
- ***Nobel Lecture Week:*** The Stanford community had the unique opportunity to hear presentations by two of the most significant figures in biomedical research, both of whose extraordinary contributions have been recognized by the Nobel Prize. On Thursday April, the Second Edward Rubenstein Lecture was presented by Dr. Sidney Brenner to a standing room audience in the Fairchild Auditorium. And then on Friday April 15th Stanford's own Dr. Arthur Kornberg gave the Annual Robert A. Chase Lecture entitled, "Reflections on Science and Medicine." Quite a week!

Awards and Honors

- **Dr. Stuart Goodman**, Professor of Orthopedic Surgery, along with five others from around the world in the fields of Biology, Medicine and Dentistry, has been named Adjunct Professor at the University of Helsinki, Finland for the year 2005-06. Dr. Goodman will teach and do research there for short periods of time in the fields of Orthopedic Surgery and Bioengineering. Congratulations to Dr. Goodman.

Appointments and Promotions

- **Richard Lewis** has been promoted to Professor of Molecular and Cellular Physiology, effective 4/01/05.
- **Liqun Luo** has been promoted to Professor of Biological Sciences, effective 4/01/05.
- **Julie Parsonnet** has been promoted to Professor of Medicine and of Health Research and Policy, effective 4/01/05.
- **Paul Wise** has been appointed to Professor of Pediatrics, effective 4/01/05.

Dean's Newsletter May 2, 2005

NAS Issues Guidelines for Stem Cell Research and the CIRM

On April 26th the National Academy of Sciences and its Institute of Medicine jointly issued the highly anticipated "*Guidelines for Embryonic Stem Cell Research*" (see <http://www.iom.edu/report.asp?id=26661>). Prior to this report, there were no clearly defined national guidelines for embryonic stem cell research, in part because the NIH has not been engaged in human embryonic stem cell research with the exception of the restricted stem cell lines allowed under the ruling imposed by President Bush in April, 2001. Even so, the NAS guidelines are timely because of ongoing stem cell research being funded by private philanthropy and publicly, at the state level. Perhaps the most notable source of public support is the California Institute for Regenerative Medicine (CIRM) created by the passage of Proposition 71, which will award nearly \$3 billion over ten years for stem cell and regenerative medicine research in California.

The NAS Guidelines offer 23 recommendations including the establishment of institutional Embryonic Stem Cell Oversight (ESCRO) Committees. These committees would work with Institutional Review Boards to provide the additional review and scrutiny warranted by the complexity of Human Embryonic Stem (hES) cell research. The ESCRO would assure that procurement processes were reviewed and approved in tandem with adherence to ethical and legal principles of informed consent and protection of confidentiality. The guidelines address the types of research that are acceptable (which include somatic cell nuclear transfer [SCNT]) and also address research that should not

be permitted (i.e., in vitro culture of intact human embryos longer than 14 days or until the formation of the primitive streak; research in which hES cells are introduced into nonhuman primate blastocysts or in which ES cells are introduced into human blastocysts; and the committee notes that “no animal in which hES cells have been introduced at any stage of development should be allowed to breed”). The Committee also offers recommendations on the procurement of gametes, blastocysts and somatic cells “for the purpose of generating new hES cell lines” and also addresses the informed consent of donors, adherence to standards of clinical care, compliance with HIPPA and guidelines governing other related areas of research (e.g., recombinant DNA research, animal care, gene therapy, etc). In addition, the Committee addresses the banking of hES cell lines and recommends the establishment of a National Policy Review Board.

The decision about how these guidelines will impact the work supported by the California Institute for Regenerative Medicine will be determined in the near future. There is every reason to believe that the NAS guidelines will underpin the CIRM standards, which are currently being developed by a Standards Committee. CIRM guidelines should be available in the next couple of months.

Also of note, the CIRM is making progress in getting its research management infrastructure in place. This past week, the committee assigned to select scientific grant reviewers met to consider potential reviewers, who had been distilled from a list that initially exceeded well over 1,000 names. The committee, on which I serve, vetted the list and selected as finalists the most promising and experienced individuals. All of the potential reviewers are from outside California, and some are even from outside the USA. Each of the finalists, who will be presented at the May 6th meeting of the ICOC (Independent Citizen’s Oversight Committee), was interviewed by committee members and the Acting President and was discussed extensively by the search committee. I have been enormously pleased and impressed by the quality of the scientific credentials of the scholars who have agreed to serve if selected. Clearly, proposals to the ICOC will benefit from extremely experienced and high quality scientific reviews.

In addition, progress is also being made on the selection of the President of the CIRM. I also serve on this committee, which has identified some wonderful candidates. We will be interviewing finalists in the weeks ahead. These discussions are occurring in executive sessions so I can only report my enthusiasm for the process at this point. Of course I don’t need to offer an update on the selection of the site where the CIRM will be located in California. I am not serving on that committee but the debate around this topic is being extensively covered in the press. Lots of progress is being made.

Faculty Counts and Challenges

At the Academic Senate on April 27th, Dr. Patricia Jones, Professor of Biological Sciences and Vice Provost for Faculty Development, presented the annual report on faculty “Gains and Losses”. The data presented included annual trends as well as 5 and 10-year comparisons. In the aggregate, the overall number of full-time faculty throughout the university increased from 1,431 on September 1, 1994 to 1,785 on September 1,

2004. Included in these numbers are tenure line faculty, non-tenure line (e.g., research and education) and medical center line faculty (The School of Medicine's Clinician-Educator faculty are not counted in this survey).

As of September 1, 2004, medical school faculty comprised 42% of the Stanford faculty. Further, medical center faculty accounted for 66% of the overall increment in faculty size during the past decade. To provide some additional perspective and context, I made several comments regarding our faculty size and composition. First, while the size of the medical school faculty (i.e., 750 as of 9/1/04) is larger than any other school at Stanford (e.g. Earth Sciences (47), Education (46), Engineering (227), Graduate School of Business (94), Humanities & Sciences (530), Law (43) and SLAC/Research (48) as of 9/1/04), I made it clear that the Stanford School of Medicine is still among the smallest in full-time faculty size for peer research-intensive medical schools in the nation. In fact, we are only approximately 60% the size of UCSF, a third as large as Johns Hopkins and less than 10% the size of Harvard Medical School. While I believe there are numerous advantages to being a small medical school, our size does pose some challenges. I have previously pointed out how it negatively impacts our ranking by magazines like US News & World Reports (http://deansnewsletter.stanford.edu/archive/04_04_05.html#3) and also challenges us in developing or providing a critical mass of expertise in various programmatic areas of research, education or patient care.

As you likely know, while there has been faculty growth during the past decade, we have been carefully regulating and, where possible, prioritizing our growth in light of the overall faculty cap of 900 that was determined by the Provost in 2003. Indeed, in a number of areas the historic incremental growth of approximately 30 faculty per year has slowed somewhat and is being carefully monitored by the Offices of Academic Affairs and Institutional Planning. For example, the faculty number as of 4/27/05 was actually lower (739) compared to the 750 recorded on 9/1/04.

In addition to supporting important departmental needs, our goals are to assure the optimal balance of faculty (including basic and clinical) and, in addition, to allow our Stanford Institutes of Medicine, related clinical centers of excellence and strategic centers to help define and regulate the areas of faculty growth. However, a number of drivers impact this. For example, clinical program development can necessitate growth in certain areas. I would argue that our investments in clinical faculty during the past several years have contributed significantly to enabling both Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) to achieve their programmatic and financial successes during the past several years. While additional programmatic growth in clinical programs will surely occur in the years ahead, it is also imperative that we support necessary and appropriate growth in our basic and clinical research programs. One of the major rate-limiting steps we now face is laboratory space for new faculty. While our long-term facilities plans will address this over time, the current limitations are stifling. I hope that our plans to lease research space off-site will help alleviate some of the bottleneck. However, I think the only realistic solution will come from the construction of our Stanford Institutes of Medicine research buildings on campus, which will hopefully take place over the next several years.

While there has been an increase in the overall number of women faculty at the University (from 17.1% in 1994 to 23% in 2004), the percentage increases in minority faculty has been less than desired (for men the change was from 9.8% of the faculty in 1994 to 12.3% in 2004 and for women it was from 3.3% in 1994 to 4.9% in 2004). Within the School of Medicine, the percentage of women faculty grew from 19.2% in 1994 to 25.2% in 2004. The overall percentage of minority faculty in the medical school rose from 13.3% in 1994 to 19.6% in 2004. However, we still have much to do in this area – especially among Black, Native American and Hispanic faculty. We are committed to making improvements in this important area since we believe it will enrich our school and community. Clearly there will be reports on our progress in the years ahead.

Enhancing Career Development for Women

As noted above, one of our continuing and most important goals is enhancing the career development for women and minority students, staff and faculty. In discussions following our most recent Strategic Leadership Retreat in January 2005 (see the coverage in the Stanford Report: <http://news-service.stanford.edu/news/2005/february2/med-retreat-020205.html>), I have focused on the challenges we face and underscored the importance of a serious commitment to improving our recruitment and retention of talented individuals who can further expand diversity within the School. A process to address this is being led by our recently appointed Senior Associate Dean for Diversity and Leadership, Dr. Hannah Valentine, and reports of the progress of her initiatives will be presented in future Dean's Newsletters.

While our local efforts are essential, various national organizations are also committed to leadership training. On April 20-21 I attended the annual meeting of ELAM (Executive Leadership in Academic Medicine), which focuses on leadership development of women faculty. I was impressed by the high quality of this program and do believe that it can play an important role in nurturing, developing, and networking future women leaders in academic medicine. Dr. Julie Barr, Associate Professor of Anesthesia, was in this year's ELAM class, and she shares some of her observations and experiences below.

Comments by Juliana Barr, MD, Staff Intensivist and Anesthesiologist,
VAPAHCS and Associate Professor of Anesthesia, Stanford University

Good leadership is hard to come by these days, particularly in Academic Medicine. Few individuals applying for and promoted to positions of responsibility, be it a Department Chair, Institute Director, Senior Associate Dean or even a Medical School Dean have had any formal leadership training. Traditionally, the criteria for promotion to these positions in academic health care have been primarily based upon seniority and research productivity in terms of peer reviewed funding and publications. In the past, if you could "run a successful and productive lab", you could run a Department, an Institute, or even a Medical School. Today's leaders in Academic Medicine face many new challenges that call for a broader set of leadership skills. Having a fundamental understanding of

accounting principles, development and fund raising, strategic planning, interpersonal and communication skills, curriculum development, and understanding organizational systems, dynamics, and the influence of change are all necessary in order to be a successful leader these days in an Academic Health Center.

Leaders must also reflect their constituencies. Over half of the students entering medical school, including Stanford, are now women. Yet women currently make up only 10% of the Deans of US Medical Schools, with even fewer minorities being represented. Most female physicians, who initially pursue an academic career in medicine, leave before being ever being promoted above the rank of Assistant Professor, with the attrition continuing exponentially above that level. For many years, the American Association of Medical Colleges (AAMC) has offered several multi-day seminars focusing on leadership training and professional development for women (www.aamc.org) at various stages in their academic career, but the numbers of women promoted to the top positions in Academic Health Centers continues to be small.

In 1995, the Hedwig van Ameringen Executive Leadership in Academic Medicine (ELAM) Program for Women was established as the first in-depth national program that prepares senior women faculty for leadership positions at Academic Health Centers. The year-long ELAM curriculum combines traditional MBA training oriented toward issues and strategies pertinent to academic health management, with personal and professional development focused on leadership, career advancement, communication, and the use of new information and learning technologies. Moreover, ELAM provides a unique learning experience for 45 senior women at either the Associate or full Professor level from academic medicine, dentistry, and the basic sciences. Most of the course curriculum is in the distance learning format, utilizing WebCT, conference calls, and email list serves to complete course assignments and readings. There are also 3 separate week-long residency sessions that ELAM Fellows are expected to attend: one in the fall and one again in the spring at a suburban setting in Bryn Mawr, Pennsylvania, and one session is held in November to coincide with the annual AAMC meeting, which ELAM Fellows are also expected to attend. Now in its tenth year, ELAM has matriculated over 400 women from its fellowship program, and the majority of these women have subsequently been promoted to leadership positions within academic health centers. Of the 13 women Deans of US Medical Schools, 4 of them are ELAM graduates (31%), and many other ELAM graduates now hold Vice Dean, Senior Associate Dean, Executive Vice President, Provost, Executive Director, and Department Chair positions at their institutions.

As a recent graduate of the ELAM fellowship, this has been an extraordinary year for me. My experiences as an ELAM fellow have fundamentally changed the way that I view Stanford Medical School, the VA Health Care System, and Academic Medicine in general. For me, the end of ELAM marks a new beginning. I am forever grateful for the opportunity to have spent this year developing my

leadership skills and getting to know such a remarkable group of women, whose relationships I will continue to nurture and cherish throughout my career. And I look forward to the opportunity to share my ELAM leadership experiences with the students and faculty at Stanford and the VA as a way of “giving back” to my academic community.

Stanford in Chicago

As part of our continuing discussions with Stanford alumni, we traveled with the President, members of the Board of Trustees and faculty to Chicago for another Stanford Day. As we did in New York City a couple of weeks ago, Drs. Paul Berg, Irv Weissman, Hank Greeley, and I joined together to conduct an interactive panel on stem cell research and biology. As with our past presentations, this topic has been of considerable interest to the public and our alumni, who are eager to hear more of the facts as well as the challenges this new area of research poses. This event ends this year’s nationwide city visit. I am pleased that the medical school has been able to participate in these events and to provide expertise that is of general and timely interest.

Admit Weekend

On April 20 – 22nd the School hosted 77 outstanding students who have been admitted to the School of Medicine Class entering this August. This is the highest number in the past three years, since the school has been having combined Admit Weekends, rather than two separate events. Based on the reports from the Admissions Committee the students who have been admitted to date are truly outstanding. Special attention has been paid this year in assuring that applicants are cognizant of our new curriculum emphasizing scholarship and research in addition to excellence in clinical training and that they are committed to the goal of becoming both clinicians and scholars/investigators.

Biosciences Ph.D. Admissions

Next Autumn there are 83 students who will begin studies toward their Ph.D. degrees in the twelve Home Programs in the Biosciences (Biochemistry, Biological Sciences, Biophysics, Cancer Biology, Developmental Biology, Genetics, Immunology, Microbiology & Immunology, Molecular and Cellular Physiology, Molecular Pharmacology, Neurosciences, Structural Biology.) The accepted students were drawn from more than 1,000 applicants. Each student was interviewed by 5-6 members of the Biosciences faculty. More than half of those students who were accepted to Stanford Biosciences decided to matriculate here.

This is the smallest class of Ph.D. candidates we have admitted in many years and it includes 15 students from under-represented minority groups. The students who will join the Biosciences community next Autumn include scientists from 12 countries: China, Venezuela, Japan, Trinidad and Tobago, Taiwan, Korea, India, Canada, Singapore, Croatia, Romania and of course, the United States.

We look forward to welcoming these highly qualified young scientists to the Stanford Community.

Update on Funds Flow

In the February 22nd issue of Dean's Newsletter

(http://deansnewsletter.stanford.edu/archive/02_22_05.html) I presented some of the governing principles that are guiding the plans to change the "funds flow" between Stanford Hospital & Clinics (SHC) and the School of Medicine (SoM). Establishing the further validation of these principles and the developing the new funds flow methodology have been an enormous undertaking. The committee that has worked on this effort (from the SoM Marcia Cohen, Mike Hindery and Norm Rizk and from SHC Gerry Shefrin and David Keane) has put in countless hours of effort to keep this process on its very ambitious schedule. I am pleased to say that the Joint SoM/SHC Funds Flow Committee has been able to meet its aggressive timelines, and it delivered an interim report at the SHC Finance Committee on Tuesday April 25th.

The Committee is further testing the model in order to determine what accommodations might be needed to make it most successful and also to develop a transition plan that will allow the new model to be instituted in the FY06 budget planning process, which is already underway. While I know that no new model is perfect and that there will be some adjustments necessary in this one, it bears underscoring that the new funds flow model is extraordinarily more rational than any that has existed to date. Accordingly I firmly believe that once fully implemented we will have a much improved funds flow – and equally if not more importantly, a significant diminution of the usual contention that has routinely surrounded the annual negotiations on funds flow.

Medicine and the Muse

Because I was out of town and thus unfortunately missed this year's Medicine and the Muse event, I asked Dr. Audrey Shafer, Associate Professor of Anesthesia, to provide a summary of her observations. According to Dr. Shafer "Stanford's annual arts, humanities and medicine symposium, packed well over 100 attendees into the Cantor Arts Center auditorium on April 21, 2005 for an exciting celebration of interdisciplinary work and creativity. Medical student committee members James Andrews, Sarah Bein, Tina Allee, Sarah Hilgenberg, Sarah Langley, Byran Maxwell, Cindy Mong, Jason Moss, Peter van Roessel and Joanna Wrede, as well as faculty sponsor Audrey Shafer, organized the event. Hosted by James Andrews, the evening featured keynote speaker David Morris, University Professor at University of Virginia and a cultural studies specialist on pain; project presentations by Jessica Goldman, Emmanuel Osei-Kuffour Jr., Joyce Pan and Erin Butler (Anatomy of Movement), and Hetty Eisenberg, Chris Adams, Cheri Blauwet and Lori Rutman (medical scholars and concentration projects); poetry readings by Tina Allee and Candace Pau; and musical performances by Cindy Mong, Prasanna Ananth, Jason Moss, Jonathan Riboh and Matt Siedhoff. The art and poster exhibit included sculpture, literature, painting and photography by 19 students. The event was sponsored by the Biomedical Ethics and Medical Humanities Scholarly

Concentration, the Stanford Center for Biomedical Ethics and the Cantor Arts Center, and supported by grants from the Osher Foundation, The Wall Center, and Helen and Peter Bing.

I am so very pleased that the artistic talents of our students are valued by the School and that there is an opportunity for them to share their many contributions with our community at the annual Medicine and the Muse event. I also want to thank Dr. Shafer for her wonderful leadership.

Practice of Medicine (POM) Projects in the News

I was pleased to see the recent media coverage on two projects completed by some of our first year medical students, under the direction of Dr. Clarence H. Braddock, Associate Professor of Medicine, as part of the Practice of Medicine course.

One project, a proposal to let unused medicine be dispensed to the needy, was aired on April 27 before the State Senate Health Committee. State Senator Joe Simitian submitted the proposal, which calls for the State to establish a program allowing pharmacies to dispense previously sold, unexpired and unopened prescriptions medications to patients, especially those with low incomes or severe disabilities. The students who worked on this project were Josemaria Paterno, Emiley Chang, Michael Mancuso, Joe Peraza, and Sheila Ravi. The second project, launched on April 5th, is a state-wide online organ donation registry. More than 87,000 Americans, including about 18,000 Californians are waiting for an organ transplant, and 17 patients on the waitlist die every day. The goal of the online registry is to help organize a database, so that, in case someone doesn't have a donor card on them, this can now serve as the backup method. The students involved with this project were Liz Oosterhuis (a first year law student), Meghan Ramsey, Frederick Dewey, Emily Curran, Sudeb Dalai and Monique Barakat.

The Practice of Medicine is one of the new courses in the curriculum revision that began in the fall of 2003. Its goal is to provide students with the skills and perspective necessary to begin their entry into medical practice. In addition, the course has embraced our collective goal that Stanford Medical School graduates become excellent clinicians and future leaders in medicine. It is this latter emphasis that led to the "POM Project."

At the beginning of the first year of medical school, Stanford medical students form groups that select a contemporary topic in public health or community medicine. Over the course of the year, they conduct background research on the topic, including becoming informed about ethical, health policy, and community health implications of the issue. They also attend sessions in which they are introduced to the community perspective, both in concept and in practice, as they hear from people in communities about how they have turned their passion for change into actual change.

As the students become more informed about their chosen topic, they are teamed with a community partner, someone working in the area of their interest who can mentor them into turning their interest and passion into action. Each student group develops an

advocacy plan, in which they will take some concrete action to make an impact on the health of the community.

The POM Project embraces a larger role for the physician in society – not just a healer and advisor, but also a community advocate and effective agent for change. This perspective on the physician's role in contemporary practice puts Stanford at the forefront of preparing future physician leaders. Stanford students will indeed be future leaders, as they enter practice equipped with skills and perspectives that to date few physicians have ever possessed.

History of Social Work Exhibit at Lane Library

There is a new exhibit at Lane Library that I want to bring to your attention. It is entitled ***From the Fruit and Flower Mission To the McGann Lectures: An Historical Record of Social Work at Stanford University***. The exhibit was inspired by the recent publication by Leona M. McGann and Flora M. Finney, emeritae members of the Department of Family, Community and Preventive Medicine, of their *History of Social Work in the Leland Stanford Jr. University School of Medicine, 1913-1981*. Lane Library has combined photographs and documents from Lane's Special Collections and Archives with original correspondence and memorabilia provided by McGann and Finney to tell the story of the history of social work at Stanford. The exhibit is located in two cases on the courtyard level of Lane Library.

In the early years, the Stanford Department of Family, Community and Preventive Medicine collaborated with the small town of Livingston in the Central Valley (18 miles north of Modesto) and established a student volunteer clinic, primarily serving migrant workers. When McGann joined Stanford, she assumed responsibility for recruiting volunteer medical faculty. A similar clinic, called the Farm Worker Clinic, was later set up in the Salinas-Watsonville area. After their full day in Stanford Clinics, which ended at 5pm, a social worker and volunteer physician traveled to these remote clinics to treat patients the medical students had screened earlier in the day. Students were responsible for follow up patient care. Below are some links to early photos in other clinics in San Francisco:

[Waiting Room, Stanford Hospital Clinics, 1920](#)

[Cardiac Clinic, Stanford Hospital Clinics, 1955](#)

After the Stanford School of Medicine moved to Palo Alto in 1959, the Medical School Social Work program continued to make lasting contributions. This well-established clinical program was inherited by the Stanford Hospital in 1981 and continues to grow. It is complemented by the Department of Social Work in Lucile Packard Children's Hospital (LPCH).

The legacy of Stanford's Clinical Social Work program is alive and well in programs that include:

The **McGann Lecture Series**

The **Help Center**

The **Housing of Medical Emergencies (H.O.M.E.)**

The **Health Insurance and Advocacy Program (HICAP)**

If you are interested in a copy of *History of Social Work in the Leland Stanford Jr. University School of Medicine, 1913-1981*, contact Lane Library. Thanks to Leona McGann and Flora Finney for their valuable efforts to ensure that this important part of the School's history is preserved and to Heidi Heilemann for her work in putting together the exhibit. I hope you will stop by Lane Library to view the exhibit, which will be up through the summer.

Thanking Those Contributing to Financial Aid

Stanford is unique in a number of important ways. One perhaps not as well known as others is the remarkably low debt burden that our MD students incur upon graduation, even though many do 5 or more years of matriculation. Indeed, whereas the average national debt burden for students graduating from four years of medical school is approximately \$131,000, Stanford students graduate with about \$61,000 of debt – the lowest in the nation for private or public medical schools. Not only is this low debt level an enormous benefit to young people beginning their lives and careers, it also permits our students to feel free to engage in research during medical school and to pursue career pathways that are most consonant with the goals and values of Stanford School of Medicine. Of course this doesn't happen by accident. The low debt burden is the result of a robust financial aid program that is made possible by the remarkable gifts and donations of alumni and members of our community on behalf of medical education.

It is nearly impossible to thank enough those who have contributed so much to the financial aid of our students. One lovely event that helps us to express a portion of our gratitude is the annual "Financial Aid Dinner" that unites donors with the students to whom they have provided support. Allowing students and their sponsors to meet, share their stories and get to know each other provides a remarkable bond as well as a human face that each can value and celebrate. Thus it should not be a surprise that both donors and students love to attend this dinner event and find it emotionally exhilarating.

The Financial Aid Dinner we held on April 26th was no exception. Donors and students met, some for the first time, while others re-acquainted past relationships. We also had the opportunity to hear personal life stories from Sepideh Gholami, Lance Okeke and Joshua Spanogle, three of our students. They talked about how they came to Stanford and about the positive impact the financial aid they are receiving will have on their lives and careers. While there was only time to hear from three students I know that the personal stories from virtually every student would be compelling and meaningful.

I too want to thank our very generous donors for their wonderful and enduring contributions to our students and the School. They are one more reason why the Stanford School of Medicine is so special.

Upcoming Events

Cinco de Mayo - Celebrate Cinco de Mayo at a Happy Hour hosted by the Office of Diversity and Leadership, Thursday, May 5, 5-6 p.m., at the Alumni Green (by Fairchild Auditorium)

Diversity in Action: The Changing Face of Stanford University School of Medicine, presented by the Stanford Medical Alumni Association, Friday, May 6, 9:30 a.m. – 2 p.m., Fairchild Auditorium

Stanford University School of Medicine recognizes the importance of diversity. The number of women and minorities among the student population and faculty is growing, and work continues to increase their numbers. A diverse group of participants will share their Stanford experiences from medical school, postgraduate training, and faculty life. The panel exemplifies the positive role diversity plays in the practice of medicine in the 21st century.

Discussion concludes at noon and is followed by a luncheon on Alumni Green. Panelists include Dr. Fernando Mendoza (moderator), Dr. Bonnie Maldonado, Dr. Roger Peeks, Dr. Estaban Burchard, Dr. Iris Gibbs, Melissa Enriquez (student) and Cheri Ann Blauwet (student).

Information and registration about this event and other Stanford Medical School Reunion 2005 programs can be found at: <http://med.stanford.edu/alumni/reunion2005.html>

Community Lecture Series - Fifty Years of Computational Biology, by Michael Levitt, PhD,

Professor of Structural Biology. May 4, 7:00 p.m., Clark Center Auditorium. Free and open to the public.

The lecture will survey the field of theoretical structural biology as it has developed since the prediction of the alpha-helix structure by Linus Pauling in 1951 and DNA by Crick and Watson in 1952. Topics will include: predictive modeling and simulation of molecules as 3-D objects; protein molding—the process of self-assembly in which protein molecules organize into precise nano-machines; and bio-informatics with attention to classification of protein structures.

Appointments and Promotions

- **Jayanta Bhattacharya** has been appointed Assistant Professor of Medicine (Primary Care and Outcomes Research), effective 11/01/2005.
- **Mildred Cho** has been appointed to Associate Professor (Research) of Pediatrics, effective 5/01/2005.

- **Thomas Clandinin** has been appointed to Assistant Professor of Neurobiology, effective 2/01/2006.

Dean's Newsletter

May 16, 2005

Clinical Trials Under Public Scrutiny

During the past year there has been significant escalation in public scrutiny of the conduct and reliability of clinical trials leading to the approval of new drugs in the USA. These concerns have focused on the policies and procedures that assess the safety profile of currently prescribed pharmaceuticals agents. These worries have been fueled by the recent revelations regarding safety of the COX-2 class of non-steroidal anti-inflammatory drugs (e.g., Vioxx) and the use of antidepressants in teenagers.

One of the concerns frequently expressed is that the business of drug development and marketing can be at odds with the goal of assuring public safety. This tension is aggravated by the large investments drug companies must make in the development, testing and licensure of a new drug (which some estimate to be between \$800M – \$1.2B) and their need to recoup these costs and generate a profit. The proprietary concerns of industry can, according to a number of observers, impact on the transparency and even veracity of the data reported or made publicly available, in part to avoid actions that would either affect the investment of stakeholders or stock values or give an edge to competition. It goes without saying that drug development is a multi-billion dollar business and that the stakes for success or failure are enormous at many levels. It is also important to note that the development and approval of new drugs, biologicals and devices have had numerous positive effects on disease morbidity and outcome, so that it is important to find the correct balance between the needs and expectations of the public and those of industry.

One of the practical concerns that have come to the forefront is the potential selective reporting of clinical trials in medical journals, whether purposeful or inadvertent. Almost all scientists and investigators know it is hard to get negative data published even when those data are the result of well-designed experiments or clinical trials. Recently editors of major medical journals have expressed the concern that reports of clinical trials do not always adhere to the endpoints delineated in the clinical protocol and that “cherry picking” may be occurring in order to place the data in a better light. In fact such concerns have become so significant that in 2004 the editors of 13 major international journals published concurrently in their respective journals a joint statement entitled “*Clinical Trial Registration: A Statement from the International Committee of Medical Journal Editors (ICMJE)*” (see JAMA 2004;292:1363-64). The statement announced that clinical trial registration would become a prerequisite for consideration of publication in any of their journals (which include the *NEJM*, *JAMA*, *Annals of Internal Medicine*, *Lancet*, and the *Canadian Medical Journal* among others). The Association of American Medical Colleges (AAMC) and the AMA endorsed the statement. Other organizations, including the World Health Organization, have also adopted

recommendations favoring a clinical trials registry. While not a panacea, the registration of clinical trials in a publicly accessible data-base would provide the opportunity to assure that all the key constituencies – including the public, journal editors, the academic community, industry, the FDA, and the NIH – had access to the important information that forms the basis of clinical trials, thus avoiding the potential for selective bias in reporting or regulatory filing.

In order to move this process forward, the Health Science Policy Board of the Institute of Medicine (which I chair) held a public meeting on clinical trials and reporting in December 2004. Because we made so much progress during that session, Gail Cassell, also a member of the IOM Health Science Policy Board, and I held a series of additional meetings between January and March with major medical journal editors and pharmaceutical industry leaders to work through remaining differences. We made considerable additional progress and at least by way of principles agreed that a clinical trial registry must be:

- Global in perspective
- Accessible to the public for a nominal fee or at no cost
- Located on a single website or linked via a single portal
- Open to all prospective registrants
- Managed by a not-for-profit organization
- Searchable electronically
- Able to provide a mechanism to ensure the validity of the registration data
- Able to ensure adherence to the registry standards
- Set up so as not to reduce the incentive to do clinical research, whether public or privately funded

We further defined nearly all the elements that would be contained in a clinical trials registry, and we will be discussing those at our public meeting at the end of June. Given the current activity in the Congress to regulate clinical trial reporting and registries and the strong stance taken by medical journal editors, industry and the public, this process is timely. We will be publishing the work we have accomplished to date on the IOM website in the next two weeks and will welcome comments as we attempt to move this issue to resolution in a manner that values the public trust.

Important New Faculty Recruitments

During the next couple of weeks I will be announcing a number of truly important faculty leadership recruitments that will play a major role in shaping some of our most important School of Medicine and Medical Center initiatives. I will bring those forward as soon as we have reached final agreement. But I am very pleased to announce two of these today.

Dr. Beverly Mitchell has accepted our offer to come to Stanford as Deputy Director of our proposed Comprehensive Cancer Center. Dr. Mitchell, currently Professor of Medicine at the University of North Carolina, has had a distinguished career in hematology and oncology. She is the past President of the American Society of Hematology and a member of the Institute of Medicine of the National Academy of

Sciences. She will play a major leadership role in our efforts to be designated a Comprehensive Cancer Center. Along those lines, I am happy to report that we are on track to submit our proposal to the National Cancer Institute this October. Dr. Mitchell's academic appointment will be in the Department of Medicine. She will join us in June.

Dr. Mike Clarke has agreed to come to Stanford to help lead our cancer and stem cell initiative as the Associate Director of the Institute for Cancer and Stem Cell Biology. Dr. Clarke has had an enormously distinguished career at the University of Michigan where he is Professor of Medicine. Among his many important discoveries, he and his collaborators recently identified the breast cancer stem cell - a finding that has galvanized attention on the role cancer stem cells might play in unraveling tumorigenesis and paving the way for developing more specific therapies. Dr. Clarke's academic appointment will also be in the Department of Medicine, as well as in the Institute for Cancer and Stem Cell Biology.

Please join me in welcoming Dr. Mitchell and Dr. Clarke to Stanford.

Inside the ICOC – What was Most Important Didn't Make the Headlines!

On Friday May 6th, the Independent Citizens Oversight Committee (ICOC) for the California Institute of Regenerative Medicine (CIRM) met in Fresno. Among the items on the agenda that attracted the most public attention – in a nearly circus like atmosphere – was the selection of the city that will house the administrative headquarters of the CIRM. Given the nearly minute-by-minute press coverage of the event, you surely must know by now that San Francisco was selected to house the CIRM offices. While a thoughtful process to determine which city would “win” the competition for becoming the “stem cell center of California” had been undertaken by the Site Selection Committee of the CIRM, in the end the vote of committee closely followed the regional residence of the ICOC members (there were only 2 exceptions among the 29 members). And while San Francisco was proclaimed the winner over San Diego and Sacramento (which had also made the final list of contenders) this surely requires some perspective. I should immediately add that I voted for San Francisco, likely for some of the same reasons that members from Southern California voted for San Diego or those from the Central Valley voted for Sacramento. And while I am pleased with the outcome, I never felt that this was the most important decision or set of recommendations emanating from the ICOC. Indeed, it may be worth stepping back a moment to consider this decision a little more objectively.

The CIRM is a remarkable and history-making event for all of California and, as a consequence, for the USA. While there may be some cachet for the city that can claim that it houses the administrative hub of the CIRM, which will fund nearly \$300M of research programs per annum for the next decade, it must be quickly added that the vast majority of that research will happen outside of San Francisco. The actual scientific work will take place in the universities and research institutes and centers throughout the state. And while it has been asserted that the location of the CIRM administrative offices will promote developments in biotechnology in its host city, it is more likely, in my opinion, that these developments will be driven more by where the science and research

is leading the edge – which obviously will include Stanford and almost surely the San Diego corridor – in addition to San Francisco.

While I am happy that the location of the CIRM administrative headquarters has now been decided and reported around the nation (albeit with all-too-much fanfare), it is perhaps unfortunate that the even more important decision made at the May 6th ICOC meeting received little public attention. This was the appointment of the 15 scientists and investigators who will serve on the “Scientific and Medical Research Funding Working Group.” This group will serve as the reviewers of the research and training proposals that will come to the CIRM for funding. What is particularly notable is the excellence of the individuals who were selected and who have agreed to serve on Funding Working Group. I was a member of this selection committee, and I can assure you that the process we followed was thoughtful and rigorous. It offers true evidence that the CIRM will be successful and that our scientific colleagues from throughout the nation are committed to making it so.

A few words about the process for selecting the Funding Working Group: The process began in January with discussions of the eligibility criteria for potential members and of how nominations would be solicited and evaluated. Potential candidates needed to be “outstanding and highly recognized experts in the field of stem cell research, including biomedical research that is necessary to develop therapies to implement stem cell research.” However it was also noted that potential candidates could (and should) include scientists in related areas of biomedical research. They would have substantial evidence of scientific achievement (measured through their own publication record) as well as experience in grant reviews. Further, potential candidates needed to reside outside of California, be willing to make the time commitment to the review process and not have any conflict of interests based on a set of criteria established on April 7, 2005.

Based on recommendations from scientific peers in California and throughout the USA as well as from professional societies, the National Academy of Science, patient advocacy groups, general public, etc, some 800 names were collected for review. The committee divided these into a “top tier” group of 200 names and a “second tier” group of 600 names. The lists were then divided randomly among six two-person interview teams, who reviewed and then ranked their assigned list, with the knowledge that individuals from the second tier could be moved to the top tier if appropriate. The interview teams then reviewed the CVs of their assigned candidates and distilled their list into a subgroup that was interviewed by phone. Each of the six two-person review teams then recommended eight names to the Committee Chair. Additional interviews to address issues such as conflict of interest in more detail were conducted by Dr. Zach Hall, the Interim President of the CIRM. When this process was completed the entire committee met to present, discuss, review and select the top 15 candidates, as well as alternates, who would be presented to the entire ICOC for approval on May 6th. The process was rigorous, thoughtful and transparent. And in the end an amazingly well qualified group of individuals were approved at the first members of the CIRM’s Scientific and Medical Research Funding Working Group. To give you a flavor of the quality of the individuals

who agreed to serve and who were selected on May 6th I am taking the liberty of listing them below:

Selected Scientist	Area of Expertise	Institutional Affiliation
Susan Bonner-Weir	Diabetes	Harvard/Joslin Center
Ali Brivanlou	Developmental Biology	Rockerfeller University
Patricia Donahue	Cancer/Developmental Biology/Pediatric Surgery	MGH/Harvard
Andrew Feinberg	Cancer	Johns Hopkins
Alexandra Joyner	Developmental Biology	NYU
Judith Kimble	Stem Cells, Organogenesis	University of Wisconsin
Jeffrey Macklis	Neurodegenerative Diseases	Harvard
Stu Orkin	Hematopoiesis/Pediatric Oncology	Dana Farber Cancer Institute/Harvard
Jeffrey Rothstein	Neurodegenerative Diseases	Johns Hopkins
Pablo Rubenstein	Hematopoiesis (and cord blood stem cells)	New York Blood Center
Dennis Steindler	Neurological Disorders	University of Florida Stem Cell Institute
Ranier Storb	Hematopoiesis, Stem Cell Transplantation	Fred Hutchinson Cancer Research Center
Clive Svenden	Neuro Stem Cells	University of Wisconsin
Alan Trounson	Stem Cells including SCNT	Monash University (Australia)
George Yancopolous	Neuro and Auto-Immune Disorders	Regeneron Pharmaceuticals

In addition to these 15 individuals (the number specified by Proposition 71), an equally distinguished group of alternates was selected who will serve for selected reviews or as replacements for individuals who may drop out in the future. These lists are comprised of superb scientists – both basic and clinical – who have a variety of backgrounds, areas of expertise and institutional representation. A number are members of the NAS, IOM, HHMI and all have evidence of wonderful credentials. Seven patient advocates who are members of the ICOC will join these scientists to comprise the 22 members of the Scientific and Medical Research Funding Working Group. This is terrific news. In my opinion this was the story of the day, although it did not get the requisite public attention compared to that given to the site selection decision described above.

Although we are still early in the process, I am increasingly optimistic that the CIRM will be successful in funding rigorously reviewed and high quality research – and that this will surely add to our knowledge of stem cell biology and regenerative medicine and thus enhance this important field and the national discussion that continues to unfold around it.

Where are We With Our Facilities for Education and Research?

I have previously reported on our facilities plans for the School of Medicine but thought it would be helpful to give you an update on where we are now and where we are going. Currently master facility planning is underway in the Medical School, at both of our affiliated hospitals and at the University. These include locations both on and off-campus along with immediate timelines and those that extend over the next 1-2 decades. Given the rather disorganized way that facility planning and building has occurred at the Medical Center (in contrast to the University) it is essential now – perhaps more than ever – to develop an integrated plan within the School and in relation to the Medical Center and the University.

Within the Medical School we have recently completed a Master Site Plan in tandem with the University that defines the buildings that will come (and go) during the next 10-20 years. As part of the SEMC (Science, Engineering and Medicine Campus planning) we have been working on two major buildings at the School of Medicine. One is the Learning and Knowledge Center, a 120,000 gasf (gross available square feet) building that will be located on the site of the current Fairchild Auditorium. It will house small and larger group classrooms, a multifunctional conference center, hospital and clinic simulation and virtual reality centers, and a digital knowledge and information center (representing the library of the future). The LKC will serve as the central hub for knowledge and learning for medical and graduate students as well as residents, fellows and faculty. It will also be a community resource for the public and for continuing medical education. In tandem with the new LKC we envision renovating portions of the Lane and Alway buildings to accommodate student services and related administrative support functions.

This ambitious and exciting project will create a new front door to the School as it faces the University and especially the new Science and Engineering Quad. While the ultimate construction of the LKC is contingent on funding from a variety of sources – most notably philanthropic support – it is our hope that this new facility can be completed between 2008-2009, which will be both the centennial anniversary of the School of Medicine and the 50 year anniversary of the relocation of the School from San Francisco to Palo Alto. Although much work remains, we had the opportunity last week to present a status report of our planning efforts for the LKC to an ad hoc committee of the Board of Trustees that oversees facility planning and development on campus.

The second project that is part of the SEMC plan is the Stanford Institutes of Medicine 1 (SIM1). This is currently slated to be a 200,000 gasf building on the parking lot south of the CCSR. We are planning to house portions of the Institute for Cancer and Stem Cell Biology, including the Comprehensive Cancer Center, and the Neuroscience Institute in this building. Because we are so space constrained at this point, we have also recently leased a 70,000 gasf research building on Arastradero Road in the Stanford Research Park. We will initially house investigators in the Cancer/Stem Cell and Neuroscience Institutes in the Arastradero building until SIM1 is completed (also hopefully by 2009). We would then use the Arastradero building as swing space for the Cardiovascular Institute or the Immunity, Transplantation, Infection Institute as well as other school

initiatives, until SIM 2, 3 and 4 are constructed. These other SIM buildings are clearly on the more distant horizon. Once SIM 2 is completed, likely 5-10 years from now, it is probable that the Fairchild Science building will come down and that area converted to green space. During this period every effort will be made to achieve more unity and better coordination of the medical school campus by aligning the east-west corridors and developing a much more integrated campus plan.

In addition to the LKC and SIM 1-4 we are also assessing (and reassessing) the future of the Stone buildings and, in particular Grant, Alway, Lane and Edwards. I recognize that these buildings are nearly 50 years old and lack the floor-ceiling ratios now required for wet laboratory construction, along with many other missing facets. On the one hand nearly 30 % of our research laboratories are located in these now ever-aging buildings and we lack alternative space. Obviously the costs of renovation, as well as the price tags already mounting for other new buildings, will influence our assessment. So too will the time line in which we can exercise options. In reality until we have SIM 2 (and ideally SIM 3) it will be very hard to find space for the research programs currently in the Stone buildings. In the meantime we are continuing to renovate the space, move new programs into it and prepare for the necessary seismic retrofitting.

The decisions around the Stone buildings will also be influenced by hospital planning and in particular by the fact that SHC will not be able to house patients in their portion of the Stone building after 2030. While that is certainly a long way in the future, it is important to recognize the long lead-time needed for planning, approvals, funding, etc. So these issues are very much on our radar screen today. Our original hope had been to replace the wet laboratory functions in the Stone complex with dry research laboratory and administrative space, and these are still active considerations. In addition, we are exploring leasing additional research space off campus to meet some of the current demands and to provide some relief until SIM 1 and the other SIM buildings are available.

At this juncture my highest priority is to get forward traction for the LKC and SIM1. Both are critically needed and for different reasons. But together they are critical for our ability to carry out our fundamental missions in education and research, and they offer the next bold steps in the continued transformation of Stanford as a leading research-intensive school of medicine and university.

Medical Student Research Day

On Wednesday May 11th, the Twenty-Second Annual Stanford Medical Student Research Symposium was held in the Fairchild Lobby and Terrace. Approximately 43 students presented posters of their work, which ranged from basic to clinical research, and which they had performed as Medical Scholars, or in their Scholarly Concentrations or via other programs. The topics were far-ranging and I was particularly pleased to see how engaged the students were in their own research, and equally how much their classmates and colleagues engaged with them during their presentations to discuss, critique and learn from each others' contributions.

I want to thank the SMAA for their continued support of this important annual event and also the members of the Program Committee for attending to all the details that made the event so successful. These included Dr. Pat Cross, Associate Dean for Medical Student Research and Scholarship, Benjamin Berk, MS II, Benjamin Hoehn, MS VII, Eliza Long, MS IV, Mary-Elizabeth Muchmore, MS III, Marie Huong Nguyen, MS IV and Eric Sundberg, MS I. I also want to thank Marie Berumen, the Symposium Program Coordinator.

Report from the Neuroscience Institute at Stanford Annual Retreat

The Neuroscience Institute at Stanford recently held its Annual Retreat. Because the efforts of this Institute are so important to the future of Stanford, I asked Dr. Bill Mobley, the NIS Director, to provide a summary of the Retreat. His report follows:

“The Third Annual Retreat of the NIS was held on May 8th through 10th at Asilomar. This exciting event captured the interest of the entire neuroscience community. A total of 207 registered; in attendance were large numbers of faculty, postdoctoral fellows, graduate students and staff members. In addition, several members of the NIS Advisory Council were present as were representatives from the biotech industry. Twenty-five platform presentations and a large number of posters highlighted the diversity of studies being carried by members of the NIS. All levels of analysis of the nervous system were represented and both fundamental mechanisms and clinically relevant issues were covered. While some presentations focused on the biology of individual channels or molecular machines, others defined the biology of neuronal circuits, learning mechanisms in animals, or the consequences mutant transgenesis on neuronal function. Equally exciting was the diversity of tools used by investigators. They ranged from genetic, pharmacological and cellular probes in cells and animals; to the use of platforms for examining the structure and activity of circuits in vitro; to a newly invented 2-photon microendoscope to visualize individual hippocampal neurons and blood vessels in vivo. A final indicator of diversity was the departments from which participants were drawn. Whether located in the School of Medicine or in the School of Humanities and Sciences, essentially all basic science departments in which neuroscience is done were represented as were all of the clinical neuroscience departments. Finally, attendees were entertained and informed by keynote speaker William Dement whose many years of contributions to Sleep Medicine were beautifully detailed. We intend in future years to continue this tradition of inviting a senior or former member of the Stanford neuroscience community to present the keynote address. It provides a unique opportunity for younger members of the community to learn about the traditions of neuroscience at Stanford.

The faculty met as a group during the retreat to review progress and plans. The Director of the NIS, Dr Mobley, reviewed accomplishments over the last year. Most importantly, the NIS has demonstrated its commitment to building the entire neuroscience community and to establishing the relationships needed to initiate and sustain major collaborative efforts involving basic and clinical

neuroscientists. The NIS has or is providing support for the recruitment of no less than 7 new faculty members distributed across both basic science and clinical departments. Current plans include participating in additional recruitments, at least one of which is to be joint with the Stem Cell Institute. The NIS sponsors a diverse collection of Theme Group meetings, at which faculty discuss their work, and a seminar series that attracts the interest and participation of the entire community. In addition, Dick Tsien and Liqun Luo are just now completing work on plans for the Beckmann Symposium which this year is entitled “Sensation to Action.” With help from the Packard Foundation and the Harman Endowment, the NIS has inaugurated a new grant program for basic and clinical studies in developmental neuroscience. With funds from a private donor, it can now initiate a research program focused on the biology of Parkinson’s disease. New Core facilities have been established for animal behavior and for fabrication of new tools to support neuroscience research. In addition, the NIS has undertaken to support new efforts in graduate and medical student education. Finally, it has committed through fundraising to develop the new resources that will be needed for further program development.

While effort over the past 18 months has focused appropriately on building the neuroscience community, the faculty believes that now is the time to define major cooperative, collaborative, and synergistic programs that broadly represent the faculty and that capture the most dynamic and exciting possibilities in neuroscience research. While the NIS faculty recognizes the importance of translational research, they acknowledge that developing a truly robust vision of translational neuroscience means developing an equally robust vision for fundamental neuroscience and for linking the two. It was agreed that a focus that was purely fundamental or purely translational would neither serve the diverse NIS faculty nor accomplish the vision that the NIS has set for itself. With this in mind, the faculty has begun to define major, ambitious programs that capture the interest and support of the entire faculty.

One suggestion was provided by Sue McConnell, a member of the NIS Steering Committee. She characterized it by applying the term “seeing neural circuits in whole new ways.” As Sue indicated, “at the forefront of neuroscience are imaging technologies that enable us to visualize neurons and circuits in powerful new ways. By virtue of our strengths in neuroscience, engineering, and computer science, Stanford is perfectly positioned to marry the development of new technologies with classic questions in neurobiology and neurology. These methods span the levels of analysis used in neuroscience, and include: the use of confocal microscopes to detect protein movements and trafficking at the subcellular level, ultra-fast imaging methods and physiological indicators to measure the responses of individual neurons in active neural circuits, genetic expression of fluorescent and enzymatic tags that enable the visualization of neural connections in development and adulthood, tiny two-photon “endoscopes” that permit sneak looks at neural activity and blood flow deep inside the brain, novel electron microscopic methods that enable the reconstruction of complete

synaptic circuits, and potent imaging methods to visualize the firing patterns of neurons in awake, behaving animals and humans. Stanford researchers have pioneered these new methodologies and are continuing to do so in ever-more creative ways. These new methods enable us to visualize the neurons, their constituent proteins, their connections, and their activities in development, adulthood, and disease. Most importantly, they also enable us to see the nervous system in new ways, leading to new concepts and hypotheses about the mechanisms that enable normal function and those that break down and lead to neurological disease. This theme encompasses most of the work that goes on at Stanford". She correctly identifies it as a way to "market the uniqueness of the NIS," thus differentiating it from other neuroscience institutes that are emerging across the country. There was enthusiasm among the faculty also for decoding the signals generated in circuits, a theme that beautifully complements the emphasis on imaging. The faculty was in agreement that building and properly supporting a program to see circuits and decode their signals would serve to establish stronger programs in both fundamental and translational neuroscience and to link the two.

A number of approaches must now be considered for supporting "seeing neural circuits." We will consider carefully how the initiative might lead to new faculty recruitments and to support research in existing laboratories that have been or wish to do such work. Another mechanism is to support the development of new tools by the faculty and to provide increased access to existing tools for imaging circuits and recording their function. The NIS is now planning for the use of space at the Arastradero facility. In support of "seeing neural circuits" it was agreed that we would develop space for a new effort in neuroimaging that would use the most sophisticated existing methods and support the development on new ones. This effort, designed with the entire faculty in mind, would be financed from fundraising. It would also provide computational support for investigators that use the facility and those who carry out studies on campus that require advanced needs for computation. The need for other Core facilities (e.g. animal behavior, clinical databases, unique or expensive molecular reagents) was also indicated.

We anticipate equally exciting additional new program development and will ask our faculty to take a leading role in defining what the NIS can do for them. We will ask that new programs appeal to a broad audience and attract significant funding from philanthropic donors and foundations. In this light, the NIS is working carefully with the OMD and we are hopeful that this will yield much success."

Alumni: Perceptions and Annual Events

May 6-7 was the Annual Alumni Weekend sponsored by the Stanford Medical Alumni Association. It was an outstanding weekend featuring special gatherings of graduates dating back to the 1940's and featuring in particularly the 50 Year Alumni Celebrants

from the Class of 1955 (of which there was an A and B graduating class!). Among the exciting events was the Saturday morning symposium “New Frontiers in Medicine: How the Four Institutes of Medicine Will Change our Profession.” The Symposium featured presentations by our four Stanford Institute of Medicine Directors including: Dr. Bill Mobley, Director of the Neuroscience Institute at Stanford; Dr. Bobby Robbins, Director of the Stanford Cardiovascular Institute; Dr. Mark Davis, Director of the Stanford Institute for Immunity, Transplantation and Infection (IITI); and Dr. Irv Weissman, Director of the Stanford Institute for Cancer and Stem Cell Biology and Medicine. Each gave status reports on their Institutes and described how they will likely evolve in the years ahead. The Directors also each invited faculty colleagues to illustrate specific areas of progress or opportunity related to the work of the Institutes. I want to thank our faculty speakers for Neurosciences (Drs. Jaimie Henderson and Greg Albers); Cardiovascular (Dr. Tom Quertermous); and IITI (Drs. David Relman and Judy Shizuru for wonderful presentations and contributions. Thanks also to the Institute Directors for a very well informed and interesting symposium.

The Alumni Association is currently working hard to embrace more fully the wider spectrum of Medical School graduates, including MD and PhD graduates as well as residents and fellows. Making the School and University more attractive and meaningful to our graduates is an important objective, one that I support enthusiastically. A recent survey done by the Stanford Alumni Association regarding graduate students found that 97% of graduates of the various graduate and professional schools at Stanford were satisfied with the academic experience they had at their school. Interestingly, while the School of Medicine graduates score highest on believing that they had excellent academic preparation, they do not have the highest overall positive feelings as alumni about the Medical School in comparison to other schools at Stanford. Thus, there is still considerable work to do to assure that our alumni feel as engaged and informed as possible. That said, I do want to acknowledge the notable progress that has been made in recent years in improving our alumni association and interactions. For their many efforts in this area I would like to thank Dr. Ross Bright, Associate Dean for Alumni Affairs, and Dr. Linda Hawes Clever, MD’65 who served so admirably as SMAA President from 2003-2005. Her leadership was very dedicated and significant and I am most appreciative. Linda will be succeeded by Dr. Susan Knox, MD ’85, Associate Professor of Radiology; I will very look forward to working with her as well.

Upcoming Events

- Roy Vagelos, MD, retired CEO and Chairman of the Board for Merck and Co., Inc., will speak on "The Changing Pharmaceutical Industry" at noon on May 23 in Fairchild Auditorium. Dr. Vagelos will describe changes in the pharmaceutical industry with the perspective of an insider of the highest reputation. He is a biochemist and a member of the National Academy of Sciences. Dr. Arthur Kornberg will introduce Dr. Vagelos.
- The Departments of Radiology and Radiation Oncology invite the Stanford community to to celebrate the Centennial Anniversary of Radiology at Stanford

on Saturday, May 21st at the Lucas Center (1201 Welch Rd). This special event will open with interactive poster presentations of important scientific advances in medical imaging and radiation oncology from 1:00-2:30 pm. A symposium will follow, from 2:30 pm - 5:00 pm, which will celebrate Stanford Radiology's pioneering efforts over the past 100 years and showcase the promising future of imaging and the potential of personalized medicine.

Industry speakers will include: Jeffrey Immelt, President and CEO of GE, Richard Levy, President and CEO of Varian, Erich Reinhardt, President and CEO of Siemens Medical Solutions. Stanford speakers will include: Sanjiv Sam Gambhir, M.D., Ph.D., Amato Giaccia, Ph.D., Gary Glazer, M.D., Richard Hoppe, M.D., Saul Rosenberg, M.D., John Shoven, Ph.D. and Matt van de Rijn, M.D.

For further details visit :<http://100yearsofradiology.stanford.edu>

Honors and Awards

- **Dr. Dan Bernstein's** appointment as the Alfred Woodly and Mabel G. Salter Professor of Pediatrics was celebrated at a lovely event at the Faculty Club on Monday May 9th. Among the guests were the grandchildren and great grandchildren of the Salter family along with friends, colleagues and members of Dr. Bernstein's family. Dr. Bernstein has had a most distinguished career in pediatrics cardiology at Stanford. During the past 19 years he has helped shape the division of cardiology and the department of Pediatrics as well as the Lucile Salter Packard Children's Hospital (LPCCH). Dan has also played a key role in some of the major recruitments in cardiology and cardiovascular surgery that have propelled LPCCH into the top tier of children's hospitals in the USA. Congratulations to Dr. Bernstein.
- **Dr. Stephen Fortmann**, Professor of Medicine and Director of the Stanford Prevention Research Center is the 2005 recipient of the Joseph Stokes Award from the American Society of Preventive Cardiology. This award is given in recognition of excellence in furthering education, research and the practice of preventive cardiology. The Stokes award honors Joseph Stokes III, M.D., a cardiologist and epidemiologist and co-principal investigator of the Framingham Heart Study, a study that is widely recognized for advancing understanding of the causes and prevention of heart disease. The award was presented May 1st in conjunction with the Annual Conference on Cardiovascular Disease, Epidemiology and Prevention held in Washington D.C. Best wishes to Dr. Fortmann.
- **Dr. William Northway, MD '57**, Professor of Radiology (Diagnostic Radiology) and of Pediatrics (Pediatric Radiology), Emeritus received the 2005 JE Wallace Sterling Lifetime Alumni Achievement Award at the Alumni Dinner on May 6th at the Cantor Arts Center. Dr. Northway had a most distinguished career as a clinical radiologist and investigator and is perhaps best known for his seminal

studies that defined the pathogenesis and natural history of bronchopulmonary dysplasia. In addition to his wife and children, Dr. Northway's career was celebrated by his colleagues and friends including, Drs. Phil Sunshine, Herb Abrams and Bruce Parker. Congratulations to Dr. Northway.

Appointments and Promotions

- **Xiaoyuan Chen** has been appointed Assistant Professor (Research) of Radiology, effective 6/01/05.
- **Christine Cartwright** has been promoted to Professor of Medicine, effective 6/01/05.
- **Ronald Dalman** has been promoted to Professor of Surgery at the Palo Alto Veterans Affairs Health Care System, effective 5/01/05.
- **Terry Desser** has been promoted to Associate Professor of Radiology, effective 5/01/05.
- **Sabine Girod** has been reappointed to Assistant Professor of Surgery (Plastic Surgery), effective 5/01/05.
- **Kristen Ganjoo** has been appointed to Assistant Professor of Medicine (Oncology) at the Palo Alto Veterans Affairs Health Care System, effective 5/01/05.
- **Shashank Joshi** has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 5/01/05.
- **Laurence Katznelson** has been appointed to Associate Professor of Neurosurgery and of Medicine (Endocrinology, Gerontology and Metabolism) at the Stanford University Medical Center, the Lucile Salter Packard Children's Hospital and the Palo Alto Veterans Affairs Health Care System, effective 5/01/05.
- **Paul Sharek** has been appointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 5/01/05.
- **Phillip Yang** has been appointed to Assistant Professor of Medicine (Cardiovascular Medicine), effective 5/01/05.
- **Christine Wijman** has been reappointed to Assistant Professor of Neurology and Neurological Sciences, effective 5/01/05.

Dean's Newsletter

May 30, 2005

Secretary of HHS Participates in Stanford Public Policy Forum

On Monday May 23rd we had the pleasure of hosting Mike Leavitt, Secretary of Health and Human Services, for a Stanford School of Medicine Public Policy Forum. The Secretary's presentation can be viewed at the School of Medicine Website (<http://med.stanford.edu/events/leavitt/>). Secretary Leavitt assumed his role as the 20th Secretary of HHS on January 20th, having most recently served as the Administrator for

the Environmental Protection Agency. Prior to that he was a three term Governor of the State of Utah, where he served with distinction and where he developed an interest in health care and information systems. Secretary Leavitt began his visit to Stanford with an informal breakfast meeting that included President Hennessy as well as selected leaders from the School, Hospitals and University. He then held a town hall-like meeting, entertaining questions from the audience on a wide range of topics, from stem cell research to the state of health care in the country.

Throughout his visit the Secretary demonstrated a keen interest in learning about the opinions of faculty and staff on important topics and proved to be a thoughtful listener. He acknowledged that our current health care system is in need of significant improvement and proffered that among the two major driving factors for change is a shift from a focus on treatment to one on wellness and prevention of disease, and a significantly improved information system (and electronic medical record) with true connectivity among the providers, payers, consumers, etc. From the visit in April by David Brailer, MD, PhD, the first national coordinator for health information technology (see http://med.stanford.edu/spotlight/archive/scci_brailer.html), it is clear that improving information technology and the electronic medical record will be an important initiative for HHS and the federal government during the current administration.

The Secretary also offered concerns about the increasing costs of care and addressed in particular the impact of Medicaid on state and federal budgets. At the same time he was silent on Medicare – which is a much more costly component of the health care system, albeit one that is very politically charged because of its impact on seniors. With the national cost of health care now just above 15% of the GDP (and projected to reach 18.4% by 2013), mechanisms to control rising health care costs must figure prominently into any approach to improving the health care “system.” Among the major drivers of increasing health care costs are prescription drugs, technology and administrative costs. These rising costs challenge the drive to reforming health care in the USA, but because of the many powerful constituencies that are involved, also impact on reasoned solutions.

Gathering a better understanding of the issues and problems facing health care is an important step in seeking solutions. Unfortunately, physicians have not played as major a role in seeking solutions as they might, although many are feeling increasingly disenfranchised or disillusioned by the impact of the market place on medicine as a profession. I certainly count myself among those – but I would rather find ways to help change the system than be co-opted by it. I note that the *Annals of Internal Medicine* is beginning a series on “Understanding Rising Health Care Costs” the first article of which is written by Thomas Bodenheimer (see <http://www.annals.org/cgi/content/full/142/10/847>). Over the next several issues he and others will review some of the important issues from a variety of different perspectives focusing on the following questions:

1. “Are high and rising health care expenditures a serious problem, or is the national preoccupation with health care costs excessive?”

2. Why are health care expenditures higher in the United States than in other countries?
3. What strategies are available to slow the rate of growth of health expenditures?
4. Do any strategies exist that enable physicians to reduce costs while improving or protecting quality?"

While these questions just address one facet of the issues, I think it is clearly prudent for all of us to become as informed as possible. While change in the current health care system in the USA seems inevitable, it is my hope that physicians will take on greater leadership in stimulating and implementing these changes than they have heretofore.

Stanford as a Past, Present and Future Pioneer in Imaging and Radiation Therapy

I felt proud to be a member of the Stanford Medicine community on Saturday May 21st when the Departments of Radiology and Radiation Oncology hosted a symposium to celebrate the 100 years of Radiology at Stanford. Since the faculty and leadership guide our current success and future opportunities, it is important to begin by thanking them and acknowledging their remarkable contributions. In so doing, I want to especially thank our current departmental leaders – Dr. Gary Glazer, Chair of Radiology and Dr. Richard Hoppe, Chair of Radiation Oncology – for the roles they have played in stewarding the excellence of these programs. It is notable that Stanford has been a world leader in these disciplines – from their virtual inception. In fact, that relationship began back in 1904 at the Cooper Medical College, which became the Stanford University School of Medicine in 1908.

In a number of ways, the impact of radiology and radiation oncology epitomizes the connectivity between basic undirected research, innovation, technology development and improved patient care. When Wilhelm Roentgen questioned, in 1895, whether light might be emitted when a vacuum was created in a cathode tube connected to an induction coil, he surely did not have in mind the discovery of X-rays. Like other great discoveries, his pursuit had an unexpected result – the most important consequence of which was not anticipated by the initial inquiry. Indeed, finding that the “light” Roentgen was seeking created a “skeletal portrait” of his own hand (and eventually the famous X-ray of his wife Bertha’s hand) was a remarkable coincidence. For this work Roentgen received the Nobel Prize in Physics in 1901 – the first year that the prize was offered. From that observation the field of radiology was born – although it has undergone many quantum changes in the century that followed.

Interestingly, Roentgen’s discovery of the X-ray also contributed, somewhat coincidentally, to the field of radiation physics – and its connection to radiation oncology. In 1896, a year following Roentgen’s discovery, Henri Becquerel attended a lecture by Roentgen and became interested in the “rays” that might be emitted from other sources, including uranium salts. He began his own inquiries and demonstrated a “ray” that was produced over time by uranium – that was dubbed the “Becquerel ray.” The “Becquerel rays” were subsequently investigated by Pierre and Marie Curie, whose work laid the foundation for “spontaneous radioactivity.” The Curies, along with Becquerel, shared the

Nobel Prize in Physics in 1903. Of interest, Marie Curie went on to win a second Nobel Prize in Chemistry in 1911 for her studies on radium and plutonium and her daughter, Irene Joliot-Curie, also won a Nobel Prize in Chemistry in 1935 (along with her husband Frederic) for their discovery of new radioactive elements. Clearly these women scientists, along with countless others, offer counter evidence to the unfortunate remarks made by Harvard President Larry Summers earlier this year.

As we learned at the symposium celebrating the 100 years of Radiology at Stanford, a number of important associations have existed with Stanford Medicine during that first century – and there is enormous promise that imaging will have a remarkable impact on medicine in the 21st century. It was thus fitting that the symposium was divided into a reflection on the past, an assessment of the current efforts and their role in shaping personalized medicine (largely through the connections between molecular imaging and genomics) and importantly, the impact of new discovery, innovations and technology on the nation's health care system and economy. Indeed, Stanford has been instrumental in moving these fields forward. Stanford physics professor Felix Bloch discovered magnetic resonance in 1945 for which he won the Nobel Prize in 1952. That same year, in a parallel but different field, Stanford Professors Henry Kaplan (in Radiology) and Edward Ginzton (Physics) carried out pioneering interdisciplinary research that led to the invention of the first medical linear accelerator – which ten years later led to the remarkable translational medicine discoveries that resulted in the effective treatment of Hodgkin Disease. Stanford continues as a leader in this field today.

The contributions of Stanford faculty in diagnostic imaging and radiation oncology during the past several decades have been remarkable. Much of this history is captured in a commemorative book entitled *“The World of Stanford Radiology. 1901-2005”* edited by Otha W. Linton. It is both a remarkable history and a wonderful forecast of how imaging – especially molecular imaging – will almost certainly stimulate the process of personalized medicine.

A century later imaging extends into a multiplicity of fields. From diagnostic imaging to interventional radiology to functional and molecular imaging, it not only plays an essential role in virtually every medical specialty, but also is highly relevant to educational models and fields as diverse as archeology, psychology, law and ethics. It continues to serve as a model of interdisciplinary collaboration among physicists, physicians, chemists, computer scientists and engineers – and it has forged successful collaborations between academia and industry. Quite a story from its beginnings just over a century ago, when Wilhelm Roentgen queried whether light would emanate from a cathode ray tube.

Getting Ready for the NCI: External Advisory Committee Assess Our Progress

On Thursday May 26th, our External Advisory Board (EAB) chaired by Dr. John Niederhuber (University of Wisconsin) visited Stanford to review the current status of our planning efforts to apply to the National Cancer Institute to become a designated Cancer Center. Members of the EAB include: Dr. Shelton Earp, University of North

Carolina, Chapel Hill; Dr. Edward Harlow, Harvard; Dr. Ronald Herberman, University of Pittsburg; Dr. Richard Jones, John Hopkins; Dr. Joyce Niland, City of Hope; Dr. Louise Strong, University of Texas, Houston and Dr. Marcy Waldinger, University of Michigan, Ann Arbor. Several members of the Advisory Board participated in the March 2004 review while others were visiting for the first time. Since the last visit we have made consistent and remarkable progress thanks to the efforts of our faculty and key leaders. I particularly want to thank Dr. Karl Blume, Professor of Medicine, Emeritus, who has worked incredibly hard and diligently to continue moving this effort forward to its current success and for coordinating a highly diverse group of faculty leaders, issues and challenges.

Since the last visit of the EAB a number of significant changes have occurred. Among the most important, Dr. Irv Weissman, now the Ludwig Professor and Director of the Cancer/Stem Cell Institute, was named the Comprehensive Cancer Center Director and will serve as the Principal Investigator of the P30 grant. In addition, we have been fortunate in recruiting Dr. Beverly Mitchell from the University of North Carolina (see May 16th Dean's Newsletter: <http://deansnewsletter.stanford.edu/>) who will join Stanford on July 1st to serve as the Deputy Director of the Comprehensive Cancer Center. With the arrival in July 2004 of Dr. Steve Leibel, the Ann and John Doerr Medical Director of the Clinical Cancer Center and Professor of Radiation Oncology from the Memorial Sloan Kettering Cancer Center, the leadership team is now complete. Indeed, Drs. Weissman, Mitchell and Leibel form a complementary continuum from basic and translational research to patient care. In addition, faculty have made terrific progress in further refining their projects and we now have assembled a group of nine projects (basic, clinical and population) that are outstanding and that reflect our strengths in innovation and discovery. These are nicely complemented by a number of important cores (or shared services) that will truly enrich the environment for faculty and trainees committed to cancer research. Further, we have made progress in supporting considerable infrastructure development from a variety of private and public sources. Also, key to the grant proposal, we are fortunate to have Joanne Murphy join us as the Associate Director for Administration of the Comprehensive Cancer Center. In addition, we have leased space on Arastradero Avenue to provide a critical mass of research space to help launch our efforts and, as you know from my last Newsletter, we are in the midst of planning SIM1 that will house the NCI Comprehensive Cancer Institute, the Cancer/Stem Cell Institute and the Neuroscience Institute at Stanford. So, taken together, considerable and important progress has been made.

Thankfully, the External Advisory Board was also quite pleased and impressed by our progress. Perhaps most importantly, they judged the various programs that were presented to them during their visit as truly excellent to outstanding. They felt assured that we would have a very competitive grant submission. However, recognizing the many additional components to the grant that are necessary to make it successful – especially for a first time application – they encouraged us to make our application on February 1, 2006 instead of October 1, 2005 as we had intended coming into the EAB review. Since our final goal is to make the submission successful, we agree that this slight delay is appropriate. That said, the enormity of the task before us is considerable and while the

submission date is slightly delayed, the preparation time will need to remain on an accelerated format – with most components needing to be in place by the end of summer. That would allow us time for additional reviews including a mock site visit.

While our formal planning process began on February 1, 2003 and our now likely submission date will be three years later (February 2006), the reality is that an enormous amount of work has been accomplished. In addition to the assembly of fantastic science, we have recruited some terrific new faculty members and leaders, have undergone the cultural shift that now embraces the value of having an NCI Comprehensive Cancer Center at Stanford and have assembled the programmatic, financial and capital resources to move us forward. As a result, we have won the respect and confidence of leading peers around the country who recognize Stanford's remarkable accomplishments in cancer research and treatment, but who once doubted that Stanford would take this step towards official designation. They are now convinced that we are ready and prepared to support us.

So while it has taken longer than I originally hoped for to get to where we are today, it is appropriate to recognize and thank the many individuals throughout the school and university who have helped get us to this point. Obviously more to follow!

Department of Neurosurgery Hosts the Annual Meeting of the Society of Neurological Surgeons

On May 21-23, Stanford hosted the annual meeting of The Society of Neurological Surgeons, the oldest professional society in this discipline, which began in 1920 with Harvey Cushing as its first president. Comprised largely of department chairs and program directors who have been elected to the Society, its primary focus is to help assure the academic integrity of neurosurgery, especially in education and research. As host, Dr. Gary Steinberg, Professor and Chair of the Department of Neurosurgery at Stanford, worked with the Society leadership to put together an outstanding program.

Accordingly, the scientific program began on Sunday morning with a discussion by President John Hennessy on the "University as a Source of Innovation." That was followed by a presentation that I gave on "Addressing the Challenges of Academic Medicine for the 21st Century." In my presentation I highlighted some of the particular forces now confronting academic medicine (e.g., decreased funding from the NIH, challenge surrounding conflict of interest, lower number of MDs pursuing research and academic careers, pressures of training and cost of education, difficulties in school-hospital-community interactions – especially around economics, impact of the lack of a real health care system in the USA and the loss of public trust for medicine as a profession). I also discussed the various ways that we have sought to address some of these challenges through our Strategic Plan *Translating Discoveries* (<http://medstrategicplan.stanford.edu>). In particular I focused on the changes we have made in our medical school curriculum to train future physicians/scholars/leaders, our goals for graduate student education, and our aspirations to foster greater research opportunities for residents and fellows – which has special relevance to surgical

specialties like neurosurgery. I also described our efforts to enhance translational discovery and interdisciplinary research and education through the formation of our Stanford Institutes of Medicine, and their important alignments to clinical centers of excellence at our affiliated hospitals as well as to other academic programs within the university. Naturally, I focused specifically on the Neuroscience Institute at Stanford and the important role it is playing in fostering broad interdisciplinary themes of research across the Institutes. In addition to these positive steps forward, I also proffered that it is important for physicians and professional societies to assume greater leadership and advocacy to improve and even radically change the health care system in the USA. I also commented on how important it was to develop more interdisciplinary clinical programs or centers that align medical, interventional and surgical disciplines – lest we run the risk of continuing divisiveness within our academic centers and the consequent negative impact on training and education. Short of such changes, the great strides we have made in research will not be matched by successful alterations of our health care system – and as a consequence we could fall short of reaping the true benefits of our promise during the 21st century.

It was clear from my interactions with attendees at the meeting that the Stanford program in neurosurgery is winning accolades across the country, thanks to the role of faculty in research, patient care and education. It is abundantly clear that the much improved stature of Stanford Neurosurgery is also a reflection of the leadership of Gary Steinberg - and we all owe him thanks for that.

Continuing the Planning for the LCME

On Thursday May 25th, the Steering Committee overseeing the generation of our report to the Liaison Committee on Medical Education met to review the penultimate draft of the summary report that will accompany the more than 3,000 pages of data analyses, etc., being submitted to the LCME for our upcoming accreditation review this October. Spearheading this effort are Dr. Oscar Salvatierra, Faculty Leader, and Rebecca Trumbull, Project Director. Clearly hundreds of hours of work have gone into this effort to date and enormous progress has been made as well. While there is much to be done, including a mock site visit in late summer, I am very pleased with where we are at this point in time. I want to thank our leaders and the many faculty, staff and students who have served on the numerous committees and subcommittees working on the LCME report. I also want to thank the student committee that generated the companion medical student assessment of Stanford Medical School. We surely still have a fair amount of work to accomplish but the efforts today are gratifying – and promising.

A Question of Moonlighting

Recently, several questions have come to the Dean's office regarding "moonlighting." In reviewing this matter it struck me that it would be helpful to simply announce our policies regarding this matter. To do so, I asked Ann James, from the General Counsel's Office, to review and summarize those policies and her comments follow directly.

Per Ann James "The policies regarding clinical practice are defined in the Professional Service Income Letter Agreement (Letter) and the Rules of Practice for the Faculty Physician (Practice Rules) at Section 2.103. II. A through C. The Letter and the Practice Rules address all of the situations in which a faculty member might "moonlight" or provide patient care services for which a professional license is required, and retain the professional fees generated from such services.

Upon employment as part of the faculty of the School of Medicine, all faculty members sign the Letter, which states that: "As a condition of your University appointment and/or employment, any fees which are charged for your services are irrevocably assigned by you to, and belong to, the University (or other institution designated by the University), and must be transmitted to the accounts designated by the School of Medicine." The letter points out that there are certain exceptions, defined in the Practice Rules, but also affirms that the Stanford University malpractice program does not provide coverage for any activities for which the individual personally retains fees.

In the Practice Rules, the term "practice income" is defined as "Any income derived from direct or indirect patient care services requiring physician or other licensure for professional services, including physicians, psychologists, and doctors of philosophy involved with clinical activities... as part of their employment by Stanford University is practice income, regardless of the source of payment for those services or the purpose for which the professional service/opinion is rendered." The rules further define such practice income as: "All professional fee-for-service or contract income derived from direct, indirect or consultative patient care services requiring medical licensure regardless of whether they are of a recurrent or non-recurrent nature;..."

Income from consultation on claims or testimony as an expert or witness on the medical condition or treatment of any person is also considered "practice income" unless the services (1) involve consultation or testimony that is based solely on a review of medical records for a person who is not a current Faculty patient, (2) do not involve use of any Stanford Hospital and Clinics (SHC) or Lucile Packard Children's Hospital (LPCH) facilities, and (3) do not involve personally examining or interviewing the person. Fees from personal consultation or expert witness service on medical condition or treatment are not an exception to "practice income" unless such work meets these three criteria. The other exception to categorizing such fees as "practice income" is an arrangement that has been approved by SHC and LPCH and the income from such services accrues to the School of Medicine or to a Department solely for academic purposes.

Practice income includes all medical direction income from a laboratory, diagnostic or therapeutic facility, or any other nonprofit or for-profit enterprise where the medical director has responsibility for the quality of services rendered. Practice income does not include serving on an advisory or governing board of such an enterprise.

An exception to the income policy allows professional income earned during scheduled vacation periods to be excluded from "practice income" so long as these conditions are met: the vacation is at least 14 calendar days in duration, approved by the Department Chair, and the Chair gives prior written authorization to conduct professional patient-related services during the vacation.

Any exception to these income policies must be approved in advance by the Department Chair and the Senior Associate Dean for Clinical Affairs.

The only approved sites of practice for the faculty are the facilities of SHC, LPCH, or sites designated by the Dean of the School of Medicine after consultation with SHC and/or LPCH. The Practice Rules are clear: "No Stanford University full-time Faculty may ever maintain a professional practice outside of the sites of approved practice." The Practice Rules do provide that professional services may be provided at other sites on a non-recurring basis if approved by the Department Chair, and income from such activities is treated as "practice income."

In summary, full-time faculty of the School of Medicine have assigned all professional fees without exception to the University, which has in turn assigned such fees to LPCH and SHC. All clinical practice is to be rendered within LPCH, SHC, affiliated or contracted facilities, or facilities designated by the Dean. Consultation for faculty that involves professional income must meet limited and specific exceptions for fees to be individually retained, and every consultation that involves such professional services should be reviewed carefully to make sure it meets the appropriate exception.

If you have questions, please review them with your department chair or send an inquiry to Ann James (anjames@stanford.edu).

Community Lecture Series

Stanford physician scientists are focused on uncovering deeper understanding of neurological disorders and developing new ways to treat these diseases. Come to the next Community Lecture Series to hear experts in stroke, multiple sclerosis, and movement disorders discuss their work and the potential of new therapies to prevent or reverse the damage caused by neurological diseases. This seminar, open to the public, will be held at 7:00 pm on Wednesday, June 1st at the Clark Center Auditorium. For more information about this and other Community Lecture Series events, call: 234-0647.

Awards and Honors

- Two Stanford University School of Medicine affiliates have been elected to the National Academy of Sciences (NAS) – **Axel Brunger** (Molecular and Cellular Physiology; Neurology and Neurological Sciences) and **Gretchen Daily** (Biological Sciences). They are among the 72 new members and 18 foreign associates selected on May 3 in recognition of their distinguished and continuing achievements in original research. Congratulations to Drs. Brunger and Daily!

- **Erik Cabral, SMS II** will be a recipient of the 2005 Herbert W. Nickens Medical Student Scholarship from the Association of American Medical Colleges (AAMC). This program is designed to assist medical schools achieve diversity objectives and eliminate health care disparities. Congratulations to Erik!
- **Kent Garman M.D., M.S.**, received the prestigious Distinguished Service Award from the California Society of Anesthesiologists. This is the highest award given by the CSA and has been given out only 21 times in the past 55 years. Kent was the founder of cardiovascular anesthesia at Stanford and continues to be listed in the Best Doctors section of San Francisco magazine. Well done Kent!
- **Miriam Goodman, Ph.D.** (Molecular and Cellular Physiology) is a recipient of the 2005 McKnight Scholar Award, which grants young scientists in the early stages of establishing their own independent laboratories and research careers and who have demonstrated a commitment to neuroscience. Best wishes to Miriam!
- **Simon Hanft, SM IV** has won the William Bean Student Research Award from the American Osler Award. This annual award enables a student to pursue a project in the medical humanities. Simon will be studying the literature of physician authors, emphasizing the relationship between John Keats and William Carlos Williams. He plans to link their poetic endeavors to their training and experience as physicians and how that influenced their writing.
- **James Mark, M.D.** (Cardiothoracic Surgery) has been chosen by the Hewlett Award Committee as the 17th recipient of the Albion Walter Hewlett Award. As winner of the award, Dr. Mark will speak on “How Good Were the Good Old Days? During the Medical Ground Rounds on Thursday, June 23 at 8:00 am in Fairchild Auditorium. Congratulations James!
- **Eric Shooter, PhD**, Professor Emeritus Neurobiology delivered the Ninth Annual Stephen W. Keiffer Memorial Lecture on Thursday, May 26th. Professor Shooter’s presentation also marked the inauguration of a new series of lectureships to honor-selected faculty who become emeritus. This Emeritus Lecture series will enable Stanford faculty to learn more about the remarkable careers and works of their colleagues. Dr. Shooter also learned that with his becoming emeritus, the faculty in the Neurology Department voted unanimously to change the name of the “Keiffer Lecture” to the “Eric Shooter Lecture” as a reflection of their respect for Dr. Shooter and the enormous impact he had on neuroscience.
- **Eric Sibley, MD, PhD**, Assistant Professor of Pediatrics will become the next Editor-in-Chief of the Journal of Pediatric Gastroenterology and Nutrition. He will begin his 5-year term in January 2006. Congratulations to Dr. Sibley!

Appointments and Promotions

- **Harley McAdams** has been promoted to Professor (Research) of Developmental Biology, effective 6/01/05.

Dean's Newsletter June 13, 2005

The Dean's Newsletter will be published intermittently during the summer months. Regular biweekly issues will resume after Labor Day.

Dr. Frank Longo Will Join Stanford as Next Chair of Neurology

I am very pleased to announce that Dr. Frank Longo will be joining Stanford as the next chair of the Department of Neurology; he succeeds Dr. Bill Mobley, who will remain as Director of the Neurosciences Institute at Stanford. Dr. Longo, who was identified through a national search, is currently the H. Houston Merritt Professor and Chair of Neurology at the University of North. Dr. Longo received his MD and PhD from the UCSD. Following an internship in Medicine at NYU, he trained as a resident in Neurology and Fellow in Neurobiology at UCSF. He was Professor (in residence) and Vice Chair of the Department of Neurology at UCSF. In 2001 he moved to UNC where he became Chair of Neurology. By every measure Dr. Longo did a spectacular job as Chair at UNC, building both the clinical and academic programs, recruiting excellent faculty and enhancing the visibility of the department in both the University and community.

Dr. Longo is an internationally recognized investigator and an outstanding teacher and mentor. Indeed he has won numerous teaching awards as well as considerable praise for his research and clinical contributions. Importantly he is also a superb leader with skills that he has demonstrated in numerous settings, most recently at UCSF and UNC. I am enormously pleased to welcome Dr. Longo to Stanford and am confident that he will play a major role in neurology, neurosciences and our broader school and university initiatives. Frank will be joined by his wife Anne, a Stanford alumna and by their two children, Sophia and Daniel. Anne played a major role in the development activities at UNC. We will look forward to welcoming the Longo family to Stanford.

Commencement 2005

June 11-12th marked Commencement Weekend at Stanford. We held our School of Medicine commencement exercises on Saturday June 11th on the Dean's Lawn where we announced the graduation of 63 students receiving the MD degree, 61 receiving PhD degrees, 7 receiving PhD/MD degrees and 28 receiving Master degrees. For each graduate this represented the culmination of a long and challenging sojourn – albeit one that only ends with new beginnings – as postdoctoral fellows or residents. As always,

graduation is a wonderful day – permitting us to celebrate the accomplishments and achievements of our students with their families, friends and with our faculty.

I want to add my congratulations to our 2005 graduates and to their families and friends. Entering the world of science and medicine in the 21st century is extraordinary but carries special responsibilities. Our students will need to be prepared for – and to deal with – the rising tide of anti-science sentiment that is pervading parts of our country as a consequence of an increasing wave of religious fundamentalism. And our students will have to face – and I hope help to address – the reality that we have a fractured and increasingly dysfunctional “health care system” that needs significant repair, if not a total overhauling. It remains my hope that Stanford students will, through their knowledge and intelligence, assume positions of leadership, advocacy and responsibility that will create better paths for our citizens to follow in the 21st century.

**Commencement Address by Dr Paul Berg, Robert W. and Vivian K. Cahill
Professor of Cancer Research, Emeritus and Nobel Laureate**

Some years ago, as a result of a rather unnerving episode as a university commencement speaker, I vowed never to chance that experience again. Being an alumnus and a then recent recipient of the Nobel Prize, I was invited to speak at the Penn State University’s spring commencement. I worked frantically to prepare an inspirational address, setting forth the critical local, national and international challenges facing humanity that I believed any graduate should be challenged to solve. Confident that I had hit the right tone, I faced the 25,000 students and their families arrayed before me in the stands of their magnificent football stadium. As I began my oration, I glanced up expecting the assembled to be on the edge of their seats waiting for my pearls of wisdom. But all I could make out was a sea of half naked bodies popping champagne corks. As my talk progressed, the din of popping corks rose and the raucous hijinks that often follows popping corks became more and more evident. At that point, the futility of my mission was clear and I skipped much of what I had prepared. A huge roar of approval greeted my words “summing up.” I’m prepared to believe a widely held view that audiences at commencements are notoriously indifferent to almost anything said on that occasion.

Nevertheless, there was no way to refuse the very gracious invitation from the institution where I’ve spent more than half my life in teaching and research. And because I am forever an optimist, I will try to plant a few thoughts that you will carry away from your experience at Stanford.

First, let me say how pleased I am to share this occasion with you and what a real privilege it is to have been asked to speak at this gathering. For you, the graduates, who have worked so hard and sacrificed to make this day happen, it is, indeed, a special moment. It is also a notable occasion for your families and friends who, in spite of wondering if today would ever arrive, provided the moral and financial support to make it possible. Today is no less special for your teachers, all of whom take pride in the transformation of merely promising, talented college graduates into newly minted science and health professionals. I’m confident that I speak for all members of the medical school

faculty in congratulating you all on a job well done. But let me also add that our expectations for your future accomplishments are no less demanding than they were when you arrived.

Experience has shown us that progress in medicine is deeply rooted in and dependent upon advances in science. The inevitable consequence of breakthroughs is an avalanche of new insights and approaches to existing problems. Formerly intractable questions disappear or give way to solutions; other problems change form and raise new issues. A changing perspective is the history of science and medicine. For that reason your experience at Stanford's Medical School has been so heavily weighted to applying a scholarly and investigative approach to medical science.

Pursuing that goal after you leave here requires ongoing learning and paying as much attention to the vast areas of ambiguity and plain ignorance about human biology and disease as you presently do to accepted information and practices. You will have to cope with a rate of change greater than anything we have experienced before. For it has never been clearer that the future of medicine lies in the unknown; so many things about the physiologic and behavioral processes of human and other organisms are waiting to be discovered.

The intense effort in attending to patients in the practice of medicine will challenge your commitment to its science core. That problem came home to me some years ago when I was teaching in the Stanford's Post-Graduate Medical Education Program. During one of the breaks, I asked one of the physicians why he returned year after year when it necessitated paying a hefty fee as well as the costs of leaving his practice for a week. His answer was that when he was a medical student, he believed that medicine was part of the scientific canon. Now, in his every day practice of medicine he felt divorced or dissociated from that base. Aside from being updated about new techniques and therapies, he said that coming back to Stanford each year provided him with continuing evidence and reassurance that medicine was indeed a science. He had to "touch base with the core of medicine."

In my view, each of you by your training acquired an obligation to contribute to the fund of knowledge from which you have drawn. In an essay in *J. Clinical Investigation*, Michael Brown and Joseph Goldstein, Nobel Prize recipients for their work on hypercholesterolemia, emphasized the critical importance of patient-oriented research as distinguished from disease-oriented research. Disease-oriented research, they felt, seeks to understand the pathogenesis or origin of a disease but does not require direct contact between the patient and the scientist; their test for this is whether the investigator has ever shaken the hand a patient with the disease they are studying. By contrast, there is the investigator who studies the disease process by observing, analyzing and managing individual patients and by a synthesis of what they learn are able to uncover clues to the disease process. The latter type of physician scientists, they lament, are in too short supply because fashion, fame and financial support favor the choice of disease-oriented research. Considering the number of medical and scientific advances that have their

origins in patient-oriented research this type of clinical research is a specialty we dare not let wither.

Hopefully your stay at Stanford has, at one time or another, provoked what Horace Judson called “ the acute discomfort of incomprehension.” We all need to bear in mind that the successes that have been achieved thus far do not amount to a complete or even a very profound understanding of the distinctions of health and disease. Indeed, current ignorance is vaster than current knowledge. Nothing in the man-made world rivals the complexity and diversity of living things. No man-made information system approaches in content the amount of information encoded in genomes or the complexity of the intricate machinery for its function. In some instances, we have learned enough at least to identify important areas of ignorance. Certain of these concern long-standing questions concerning development and differentiation, or the molecular basis of mind. Others are new questions raised by the very achievements themselves. And of course, we should be wary: some things that we think we know may become less clear in the years to come or even prove to be utterly wrong.

For those of you whose appetite for investigation was whetted let me quote a passage from J. Robert Oppenheimer.

“Although we are sure not to know everything and rather likely not to know very much, we can know anything that is known to man, and may, with luck and sweat, even find out some things that have not before been known to man.”

For me, and hopefully for you, finding out something that has not been known before is an exhilarating experience. Such experiences are rare, personally rewarding and not always recognized by prominent prizes. Triumphs of the mind have their own prize---self-satisfaction!

My parting words to you are that each of you must find your own way. It is your abundant talent, your knowledge, your energy, your spirit, your courage, your commitment to humanity, to scholarship, to work and to family that will define your world and your achievements. You have more freedom to shape yourselves than young people anywhere or anytime in the history of our species. But it is a blessing beyond measure. The burden cannot be conquered nor the blessing realized by standing in anyone’s shadow.

Don’t let your talent and learning be wasted. Think creatively, courageously and independently, but above all think. Don’t allow the most extraordinary organ on earth - your brain – to grow flabby from disuse. It has the remarkable power to improve with continued use. Aim high, try hard, don’t lose your enthusiasm and idealism and above all, keep a sense of humor and enjoy life. Best wishes and good luck to you all.”

MD Student Speaker, Al Vincent Taira

I missed my college graduation, and I wasn't sure I was going to be able to attend this ceremony. A conversation with my mother a few months ago helped to clarify my plans. "My dear," she said, "I do hope you are able to go. But I want you to know that whether or not you go – they will need to tie me down in chains before I miss that ceremony.... And it would be a shame if my own boy weren't there."

I am very glad to be here and I think my mother was right. Graduation from medical school is not the same as graduating from college. When I graduated from college, it never occurred to me to think: "I can't believe they're going to give me an Economics degree. I know as soon as I start working I am going to be unmasked as an incompetent. I just hope I don't kill anyone before I'm discovered."

Have any of you ever felt that way about getting an MD degree? Do any of you feel that way today? I think we all sense that there's something different about having society refer to us as "Doctor." It will, to a large extent, define us for the rest of our lives, in our own minds and in the minds of those around us.

A surgery resident once told me, "It's a real privilege to do what we do. I know that sounds like a cliché, but it's true. We are present at the most important times in people's lives. For them and their families. Over and over. Day after day. It's not always the case, but it happens an awful lot." We have all been witness to this. I remember the faces. I know all of you have your own situations you can't forget. The patient being told, "We can't operate." Family members struggling with a DNR order for their mother or father. The parents of the child in the ICU who might not make it through the night. These images stick to your bones. And they remind you of the unique nature of the work that we are going to be allowed to do.

Before we leave this place, we would be remiss not to thank those who played such an important role in our really remarkable transformation from first year med students to proto- interns. First, for many of us, there were those of you in the faculty who chose ... 'by not killing us to make us stronger.' There is a special warm place in our hearts for your focused attention and care.

And for all of our attendings, instructors and advisors: we know you could find other jobs that would give you more disposable income, more time with your families. But there is something about being involved in the training of young physicians that draws you to academia. For your commitment and caring, we are tremendously grateful. And of course our friends in the office of student affairs and the many others involved in shepherding us through this process: Thank you so much.

Finally, we know that whatever we have been able to accomplish during our 4 to 10 years here, we owe in large measure to the support and caring of our family and friends, many of whom have joined us here today. Not surprisingly, I have heard often today, "Congratulations Al on graduating!" I say reflexively, "Thanks." Today though, what I really mean to say is "Thank you." Thank you to my wife, my friends and family...

Mom and Dad. Thank you for being there when things got tough. Thanks for your support, your encouragement, your guidance. Thanks for not giving up on me on those couple of days when I thought I might give up on myself. And of course thanks for making me laugh. Often, that (and sometimes a cold beer if it was a particularly tough day) was exactly what was needed.

Med school can be tough. Each of us has had our own challenges, our own disappointments, and our own minor triumphs. But remarkably, we have made it through. And that is in no small measure because of the support we received from those close to us.

I'm told that a good commencement speech ends with a bit of inspirational advice. My advice is simple. Tomorrow when we officially become doctors, I would sign up for a lot of new magazines. Make sure you check the "Dr." box on the subscription card rather than the other choices. Apparently, most doctors do this. Then, you too can be confident that even your mailman will know you have entered a new, prestigious phase of your life.

Graduates of the Class of 2005, it has been my great fortune to spend the last five years of my life with you as friends and colleagues. Good luck and congratulations to us all.

Graduate Student Speaker, Karine Alexine Gibbs

Like my parents before me, I ran track in high school. So my natural instinct is to compare graduate school to a running event, for example a marathon. Instead, I think a more accurate comparison is to a mid-distance race such as the 800-meter dash. The 800-meter dash is a race in which there is no time to think; one simply runs as fast as you can for half a mile. Before you fully comprehend it, it's over. And it's hard to believe as I stand here today that graduate school is truly over.

However, I think in making the comparison to a sprinting race, I fail to fully explain the amazing experience that graduate school is, especially here at Stanford. Who cannot remember the excitement of interviews? Our first glimpse of the Stanford campus, staying at the Sheraton hotel, having the chance to speak with some of the top scientists in the world, enjoying drinks at the Nuthouse or Oasis with current students—these all contributed to the initial excitement and thrill of not only being at Stanford, but of also starting a new chapter in our lives.

And then we arrived on campus starting with the Biomass camping trip and departmental orientations. Giddy with the freedom of having the chance to pursue in-depth studies of our chosen field, we migrated from one lab to another during our first year of rotations. For those unfamiliar with rotations, during our first year, we spend 10 weeks in three different research groups anywhere within the University (including on main campus). At the end of these rotations, we choose a lab in which to pursue our doctoral studies. To those outside of graduate school, these rotations must seem like a strange dating ritual: I hang out with you for three months, you hang out with me for three months. We see if

we get along. And if so, do we really have enough in common to actually make this relationship work? Yes, the research matters... but only so much.

Lucky for me, my advisor, Julie Theriot, has been a wonderful fit, and I have had a great time working with her during graduate school.

Once we chose a lab, we devised a novel biological question to answer as our thesis project. We began to develop the tools and processes needed to address it, and it seemed as if life and work continued to fly by at a rapid pace. Somewhere along the line, our initial enthusiasm of “learning new things and exploring the unknown” began to wane under the reality of classes, qualifying exams, committee meetings and experiments that didn’t seem to work no matter how hard we tried. Nights of going to the Nuthouse with friends were slowly replaced with nights of sitting at our bench moving a small amount of liquid from one vial to the next. Saturdays of hiking in the foothills slowly became weekends of analyzing data or watching cells move in the microscope. Our thesis project in the abstract was exciting. And though we were doing the kind of work that we enjoy—making small, but new discoveries—the repetitiveness of the everyday could sometimes be discouraging. And before we knew it, we were in the middle of graduate school—in other words, a dark tunnel with no light readily apparent at either end.

I think most, if not all, graduate students go through this at some point. I did. I remember sitting in Julie’s office one day during one of our bi-monthly meetings, and saying, “I’m done. I can’t do this anymore.” And she sat silently for a moment, looked at me kind of strangely and said something to the effect of, “no, you’re not. But you’re closer to being done than you were.” And to tell you the truth, at that moment, that did absolutely nothing to help me feel better.

You see, that’s kind of the point. Graduate school, for all of its requirements and examinations, is really a personal journey. It is a time where we are able to solely focus on one question—of our own creation—and to take the time and care to answer it as deeply as we so desire. With this gift, however, come drawbacks. There is self-doubt. There is fear. There is tiredness. There is loneliness. Because in the end, we are responsible for our own work. If it doesn’t get done, it’s our fault. If it is inaccurate, again, it is our fault. Quite frankly, this awesome responsibility is daunting.

Worse, to actually leave this place, we must pass through the penultimate moment of writing (and defending) our dissertation. But really, who wants to sit down and chronicle the failures and achievements of their studies of the past few years when more exciting discoveries are waiting to be made? Especially since graduation seems to come just as all of our (or at least my) experiments are working really well. However, we cannot move on with our lives or explore new opportunities without completing this task—this final hurdle of presenting the sum total of our efforts and discoveries to our colleagues and mentors with the expectation of being deeply questioned about it in order to show that we are the experts on our work.

As with most challenging journeys, the joy of completion wipes away most of the tribulations of graduate school. We regain aspects of the enthusiasm with which we entered. Now, however, this enthusiasm for science and new discoveries is bolstered by the knowledge that we were able to excel at a mentally demanding endeavor and that we can achieve great things.

And so with that, congratulations to all the graduates! Enjoy much softball, much sun and the joy of being done!

Faculty Awards

In addition to congratulating our students for their accomplishments, commencement is also a time to honor faculty who have made significant contributions to their education. Accordingly, I am pleased to list the teaching awards that were announced at the School of Medicine Commencement.

The Arthur L. Bloomfield Award: In Recognition of Excellence in the Teaching of Clinical Medicine

D. Scott Smith, Infectious Diseases

Theodore Sectish, Pediatrics

The Henry J. Kaiser Family Foundation Award: For Outstanding and Innovative Contributions to Medical Education

Garry Gold, Radiology

The Henry J. Kaiser Family Foundation Award: For Excellence in Preclinical Teaching

Clarence H. Braddock, III, Medicine

Andrew J. Connolly, Pathology

David B. Lewis, Pediatrics

Hannes Vogel, Pathology

The Henry J. Kaiser Family Foundation Award: For Excellence in Clinical Teaching

Peter Pompei, Medicine

Elizabeth Stuart, Pediatrics

Elliott Wolfe, Medicine

The Franklin G. Ebaugh, Jr. Award: For Advising Medical Students

Alfred T. Lane, Dermatology

The Lance Armstrong Foundation Compassion in Medicine Award

Neil Gesundheit, Medicine

The Alwin C. Rambar-James B.D. Mark Award: For Excellence in Patient Care

George A. Fisher, Jr., Medicine

Stanford University School of Medicine Award: For Graduate Teaching

Joseph S. Lipsick, Pathology

Stanford University School of Medicine Award: For Outstanding Service to Graduate Students

Joseph S. Lipsick, Pathology

The Graduates of 2005

The complete program for the School of Medicine Commencement, including listing of all graduates, is contained in the attached PDF file

Other Awards and Honors

- I would like to add another Stanford University School of Medicine affiliates who was recently elected to the National Academy of Sciences (NAS) – *Iain Johnstone*, who holds a joint appointment in Statistics and Health Research and Policy, was recognized for his contributions to statistics and biostatistics when the NAS designation was bestowed upon him on May 3rd. Congratulations Dr. Johnstone!
- The Pacific Free Clinic was recently recognized with The Dean of Students Outstanding Achievement Award, honoring student groups for their efforts in the Stanford community and beyond. This student-run free clinic now in its third year of operation provides services to low-income immigrants in the San Jose area, particularly targeting those who require medical interpretation to communicate with health care providers. More information about the clinic can be found at: <http://pacific.stanford.edu>.

Faculty Award Honorees, 2004 - 2005

Paul Berg, Biotechnology Heritage Award,
Chemical Heritage Foundation and the Biotechnology Industry Organization

Mark Blumenkranz, Alcon Research Institute
Award in Ophthalmology; Gertrude Pyron Lecture Award, American Society of Retinal
Specialists

Matthew Bogyo, Searle Scholar

Axel Brunder, National Academy of Sciences

Howard Chang, Dermatology Foundation
Physician-Scientist Career Development Award

Ajay Chawla, Charles E. Culpeper Medical Scholar Awards, Rockefeller Brothers Fund

Larry Chu, Career Development Award, National Institute of General Medical Sciences
of the National Institutes of Health

Sheila Cohen, Distinguished Service Award, Society for Obstetric Anesthesia and
Perinatology

Stanley Cohen, Albany Center Prize in Medicine and Biomedical Research; Shaw Prize
in Life Science and Medicine

Mark Davis, Institute of Medicine

Karl Deisseroth, Charles E. Culpeper Scholarship in Medical Science

William Dement, Peter C. Farrell Prize in Sleep Medicine at Harvard

Sarah Donaldson, Elizabeth Blackwell Award, American Medical Women's Association

Peter Egbert, Outstanding Humanitarian Service Award, American Academy of
Ophthalmology

Stanley Falkow, American Society of Microbiology Graduate Teaching Award; Society
Citation, Infectious Disease Society of America

Dean Felsher, Burroughs Wellcome Award; American Society of Clinical Investigation

Andrew Fire, American Academy of Arts and Sciences; Institute of Medicine; Laureate
of the Dr. H.P. Heineken Prize for Biochemistry and Biophysics, Royal Netherlands
Academy of Arts and Sciences; Gairdner Award

Robert S. Fisher, Most Outstanding Contribution to Epilepsy, Northern California Epilepsy Foundation; National Service Award, American Epilepsy Society

Sanjiv Gambhir, Doris Duke Distinguished Clinical Scientist Award; Society of Molecular Imaging Achievement Award; Distinguished Basic Scientist of the Year, Academy of Molecular Imaging

Christopher Garcia, Howard Hughes Medical Institute Investigator

Miriam Goodman, Eppendorf and Science Magazine Prize for Neurobiology

Christian Guilleminault, Lifetime Achievement Award, National Sleep Foundation

Edward Harris, Distinguished Rheumatologist Award, American College of Rheumatology

Leonard Herzenberg, Special Immunology Prize, Novartis; Abbott Laboratories Award in Clinical and Diagnostic Immunology

John Huguenard, Javits Neuroscience Investigator Award, National Institute of Neurological Disorders and Stroke

Richard Kempson, H.P. Smith Award for Distinguished Pathology Educator, American Society for Clinical Pathology

Seung K. Kim, Juvenile Diabetes Research Foundation Living and Giving Award

Stuart Kim, Ho-Am Prize

David Kingsley, American Academy of Arts and Sciences

Arthur Kornberg, Honorary Member, Japan Academy

Ronald Levy, William Dameshek Price, American Society of Hematology

Robert Malenka, Institute of Medicine; American Academy of Arts and Sciences

Olivia Martinez, Fujisawa Basic Science Award, American Society of Transplantation

Hugh McDevitt, Clinical Immunology Prize, Novartis

Fernando S. Mendoza, Juan Villagomez, M.D. Humanitarian Award, California Latino Medical Association

William Mobley, Institute of Medicine

Tirin Moore, Alfred P. Sloan Foundation Research Fellowship; Pew Biomedical Scholar

Robert Negrin, Doris Duke Distinguished Clinical Scientist Award

Indor Perkash, Ronald Reagan Republican Gold Medal

Stephen Quake, National Institutes of Health Director's Pioneer Award; Howard Hughes Medical Institute Investigator

Marlene Rabinovitch, American Heart Association Basic Science Research Award

Thomas Rando, Ellison Medical Foundation Senior Scholar in Aging

Saul Rosenberg, Karl Musshoff Prize, German Hodgkin Study Group; Rosetta Medical Award, Lymphoma Research Foundation

Oscar Salvatierra, Transplant Pioneer, National Kidney Foundation

Alan Schatzberg, Distinguished Service in Psychiatry Award, American College of Psychiatrists

Matthew Scott, Edwin O. Conklin Medal in Development Biology

Lucille Shapiro, Selman A. Waksman Award in Microbiology, National Academy of Sciences

Norman Shumway, Transplant Pioneer, National Kidney Foundation

Stephen J. Smith, McKnight Technological Innovations in Neurosciences Award

David Stevenson, Neonatal Education Award in Perinatal Pediatrics, Section of Perinatal Pediatrics of the American Academy of Pediatrics

Julio Theriot, MacArthur Foundation Fellowship

Irving Weissman, New York Academy of Medicine Medal for Distinguished Contributions in Biomedical Sciences

Alice Whittmore, Janet L. Norwood Award for Outstanding Achievement by a Woman in the Statistical Sciences

Christine Wijman, National Scientist Development Award, American Heart Association

Sherry Wren, Outstanding Teaching Award, Association for Surgical Education

Appointments and Promotions

- **Todd Alamin** has been reappointed to Assistant Professor of Orthopaedic Surgery, effective 6/01/05.
- **Dorsey Bass** has been reappointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 11/01/05.
- **Gerald Berry** has been promoted to Professor of Pathology, effective 6/01/05.
- **Ricardo Castillo** has been reappointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 3/01/05.
- **Michael Edwards** has been appointed to Professor of Neurosurgery, effective 6/01/05.
- **Cheryl Gore-Felton** has been appointed Associate Professor of Psychiatry, effective 6/01/05.
- **Samuel LeBaron** has been promoted to Professor of Medicine (Family Medicine), effective 6/01/05.
- **David Lewis** has been promoted to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 6/01/05.
- **Randall Vagelos** has been promoted to Professor of Medicine (Cardiovascular Medicine), effective 6/01/05.

Dean's Newsletter June 30, 2005

Shared Responsibility, Individual Integrity

On Wednesday June 15th I participated in a panel discussion sponsored by the Executive Leadership group of the Federation of American Societies of Experimental Biology (FASEB) to address "Shared Responsibility, Individual Integrity: Scientists Addressing Conflict of Interest in Biomedical Research." The goal was to bring leaders from academia, industry and the NIH together to consider the impact of conflict of interest from the perspectives of scientists and academic institutions. The conference was prompted by the LA Times report (12/08/04) regarding violations of conflict of interest policies by NIH leaders and scientists and the unfortunate events that followed. My task at this conference was to focus on how we address these issues at Stanford.

Based on the perspectives offered by Dr. Elias Zerhouni, Director of the NIH, Dr. Bill Brody, President of Johns Hopkins University and Dr. Gail Cassel, VP for Infectious Disease at Eli Lilly, who spoke before me, I underscored my personal belief that we need to do everything we can as individuals and as institutions to address conflicts of interest in a responsive and transparent manner. It seems clear that this matter is now in the public eye. Further, I believe it would be irresponsible to assume that it will simply disappear as a source of concern or that it will not be pursued by the press or by legislative or regulatory bodies. Accordingly, it is imperative that we have clear institutional guidelines and expectations and that members of our community of scientists

and physicians each take personal responsibility for acting in a manner that is beyond reproach. Given the events that occurred at the NIH last year and that have unfolded in the pharmaceutical industry within the past several months, it seems obvious that public trust has been seriously eroded – and that this is something that must be regained.

The reasons for concern – at least grounds for worry - are also compelling. For example, of 210 life science organizations surveyed in 1994, 90% reported some relationship with academia. More notably, 88% retained faculty as consultants and at one academic institution (which is likely representative) a third of the faculty had consulting, speaking or advisory board relations with industry. At top research universities, half or more of faculty had some consulting arrangement. With the passage of Bayh-Dole in 1980, these relationships are not surprising, but they do offer some grounds for concern, or at least reflective monitoring. For example, nearly 50% of academic investigators reported receiving “research-related gifts” from industry, including equipment, biomaterials, discretionary funds, student support, travel funds, etc. Moreover, nearly two-thirds of those academic scientists who received gifts reported that they were important to the progress of their research.

In addition to gifts, equity relationships have increased during the last two decades. While the actual number varies among institutions, one reported that 14% of its faculty were involved in such relationships (Boyd E and Bero L *JAMA* 2000;284:2209-2214). Obvious concerns are that such arrangements can affect academic openness, objectivity and bias among faculty and that they could jeopardize the training of graduate students and other trainees. Just this year two books addressing these concerns have been published: Jennifer Washburn, *University.Inc., The Corporate Corruption of American Higher Education*, Basic Books, February 2005, and Jerome Kassirer, *On the Take, How Medicine's Complicity with Big Business can Endanger Your Health*, Oxford University Press, September 2004. Both are receiving attention from regulators and lawmakers, among others. These publications underscore the increasing level of concern about the academic and medical community's evolving relationships with industry and about conflicts of interest.

While it is clear that the greatest risk and concern apply to conflicts of interest involving clinical trials and patient studies, it is also important to note that the dangers transcend these obvious areas. For example, the commentary by Brian Martinson et al entitled “*Scientists Behaving Badly*” published in the June 9th issue of **Nature** (435:737-738) raises many concerns. The authors describe an anonymous survey of 3,247 early and mid-career scientists. Of the respondents (there was a 52% response rate), 15.3% reported that they had changed the design, methodology or results of a study in response to pressure from a funding source. While overt fabrication and falsification was rare, over 10% admitted to overlooking others' use of flawed data or others' questionable interpretations of data, or dropping observations or data points from analyses based on a “gut feeling” that they were inaccurate. Amazingly, 27.5% reported “inadequate record keeping related to research projects.” Although some circumspection is appropriate in interpreting such a survey, it does seem that a worrisome pattern is evident. Particularly concerning is the inference that can be drawn from the data that scientists and physicians

may be biased because of ties to funding sources, most notably to industry. These findings make it imperative that individual and shared responsibility be at the forefront of concern and institutional oversight.

We recognize the important benefits that accrue from productive relations with industry. Nevertheless, it is essential to remember that the primary responsibility of each faculty member is to Stanford University and to her/his participation in its primary missions of research, education and patient care. There is no question that sharing knowledge and scientific discoveries through lecturing, writing, etc. is an essential component of the academic process and that faculty are assessed on their national and international reputations, which can be enhanced by appropriate relations with industry. These benefits have been well demonstrated with the important connections that accrued, for example, in genetic engineering – which arose in institutions like Stanford – and which spawned much of modern biotechnology. Similarly, there is every reason to believe that genome profiling and stem cell biology will have similar impacts in the future. Indeed, academic medical centers such as ours have an obligation to translate discoveries, which requires effective partnerships with industry. At the same time, academic medical centers have an equal obligation to conduct clinical research – and I would argue all research – without bias and in a manner that protects the integrity of the data as well as the public safety and trust.

It is for these reasons that all Stanford faculty are required to disclose any personal financial interests they may have regardless of the dollar amount, including honoraria and equity (stock, stock options, royalty for the faculty member, spouse/partner, or dependent children). These must be disclosed in the informed consent forms for faculty engaged in clinical research and in any public presentations and publications. While disclosure is mandated and while failure to disclose results in loss of investigator status, it is not unreasonable to query whether this policy is sufficient.

As I have commented in recent Dean's Newsletters, the School of Medicine has established clear guidelines regarding conflict of interest and has published both guidelines and tips to faculty on how to manage potential conflicts (see http://deansnewsletter.stanford.edu/archive/02_22_05.html and <http://med.stanford.edu/conflict/>). One of the important aspects – and assets – of our policy is that our Office on Conflict of Interest and the appointed Committee on Conflict of Interest begin with the assumption that our faculty will do the “right thing” if appropriately informed and educated. Hence, I encourage you to seek guidance if you have questions or concerns. Our goal is not to impede your research or opportunities but to assure that they are consonant with our values and your role as a member of the University community.

As a general rule, if a personal financial incentive becomes a significant motivation, one is likely moving into dangerous waters where objective advice and guidance are needed. Similarly, it is always wise to ask whether basic academic values are being maintained, including an open academic environment. It is also essential to assure that there no restrictions on publication or dissemination of results, that fair licensing practices are

upheld, that the research is appropriate to the mission of the university and that resources and facilities are appropriately used. It is critical as well to assure that students and trainees are not being exploited by any academic/industry relationship. While there are certainly many nuances, it should not be missed that conflict of interest is something that the public easily understands – as do journalists – so thinking about how one’s personal situation would look on the evening news or on the front page of a local or national newspaper is a good “smell test.”

I also think it is important to recognize that standards that have been accepted in the past will be more stringent in the future. Regardless of whether or not this change is manifested in new regulations or legislation, it seems implausible that this issue will disappear from public attention. It would be naïve to assume that conflict of interest will be entirely avoidable, but there is every reason to expect that such conflicts can and must be managed, especially if the faculty member seeks guidance and follows institutional recommendations. This is both an individual and a shared obligation.

Whether we need to move to broader oversight over our institutions, as discussed at FASEB, is less clear to me. I think the ultimate key is making sure that we each take our personal and university responsibilities seriously. Should you have any questions about how our conflict of interest policies apply to your research activities, I strongly recommend that you engage our institutional resources to provide help and advice. Feel free to contact Ms. Barbara Flynn, Manager, Conflict of Interest Review Program (barbara.flynn@stanford.edu) or Dr. Harry Greenberg, Senior Associate Dean, Research, Department of Medicine (harry.greenberg@stanford.edu) with your questions or concerns.

Comparing Notes on Translating Discoveries

On Thursday June 16th, I participated in a Workshop on Translational Research and Medicine sponsored by the National Cancer Institute. My role was to reflect on how we are approaching this challenge at Stanford. In doing so I shared our still evolving efforts to integrate our overarching mission in *Translating Discoveries* across the spectrum of our programs, from education to research and patient care. While we have much work to do to fully realize our goals, I think we have made progress in many areas since our Strategic Plan *Translating Discoveries* was formulated in early 2002. These include:

- **Medical Student Education** – Our New Stanford Curriculum, which commenced in the Fall of 2003, has served to refocus our medical student education objectives toward developing a strong foundation in science along with its connection to patient care. The scholarly concentrations, which enable students to engage in specific areas of inquiry and research, are perhaps the most distinctive facet of our new curriculum (<http://med.stanford.edu/md/curriculum/>). In addition to the range of possible choices for scholarly concentration, I highlighted the one focused on clinical research since it relates directly (albeit not exclusively) to translational research. Indeed, I further emphasized that all students receive some training in clinical research, but that the scholarly concentration provides a deeper

experience along with the opportunity to do research. That said, several of our other scholarly concentrations also afford opportunities to engage in clinical or translational research.

- ***Graduate Student Education*** – Our programs for graduate students begin with a focus on basic science. However we have recently introduced a number of courses that permit graduate students to learn more about the challenges in clinical medicine and the opportunities to engage in translational research. In addition, initiatives like the BioX innovation awards and the Biodesign program offer opportunities to engage graduate students in research or innovation that has a translational focus, as will the new Department of Bioengineering, which is jointly held in the Schools of Medicine and Engineering. In addition, work is proceeding to develop a “Masters in Science” program for graduate students, and we are also participating in the Commission on Graduate Education, which is seeking to develop new opportunities for interdisciplinary education across the entire University.
- ***Postdoctoral Fellow Training*** – Although postdoctoral training has traditionally been more departmental or even investigator based, we are developing ways to integrate training across the continuum. One of the opportunities we are exploring is extending the scholarly concentrations developed for medical students into the clinical training years. Another is to develop the Advanced Residency Training at Stanford (ARTS), which is being modeled after the UCLA “STARS” program. ARTS will provide PhD training for residents and clinical fellows; we hope this program will be initiated by 2007.
- ***Faculty Development and Research*** – and its relation to patient care – are being orchestrated through the development of the Stanford Institutes of Medicine and the Strategic Centers. These are designed to promote interdisciplinary education and research and to foster translational research and medicine. These also complement the Centers of Excellence at both Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital, as well as the broader BioX programs at Stanford.
- ***Support for translational research*** – To help facilitate our efforts in clinical and translational research, a number of programs are being put into place, most notably the STRIDE program, which will handle clinical data base development. Another important effort underway is the development of the Stanford/Packard Translational Research Medicine program. This initiative will facilitate protocol development and clinical/translational research through the provision of support for biostatistics, data management (including budgeting, contracting, automatic billing, accounting and audit), compliance, study source document archiving, research coordinator support, etc. These serve as a prelude to developing a Center for Translational Research at Stanford.

While each of these programs can be considered discrete, our attempt to integrate them and to draw associations and relationships between our missions in education, research and patient care and translational medicine and innovation will make us unique and will further shape the future of Stanford Medicine.

Getting Ready for a Review by the Association for the Accreditation of Human Research Protection Programs (AAHRPP)

The following commentary was prepared by Kathy McClelland, Director, Research Compliance Office, and Ann Arvin MD, Associate Dean of Research: Arthur Bienenstock, Vice Provost and Dean of Research and Graduate Policy, joins us in announcing to our research community that Stanford University is seeking accreditation of its program of protection of human subjects in research through the Association for the Accreditation of Human Research Protection Programs (AAHRPP) (www.aahrpp.org). Voluntary accreditation of human subjects research programs is a new initiative that is being undertaken by academic research institutions throughout the U.S. Stanford's program includes human subjects research conducted at the University, Stanford Hospital and Clinics (SHC), Packard Children's Hospital (LPCH), the Veterans Affairs Palo Alto Health Care System (VAPAHCS), and Palo Alto Institute for Research and Education (PAIRE).

This process will involve all of us because AAHRPP accreditation is based on the principle that human research protection must be part of the fundamental culture of institutions like Stanford. In December 2005, AAHRPP will conduct an on-site review of all aspects of our human subjects research programs. This visit will involve examining documents and interviews with Stanford faculty and staff. The site visitors could choose to interview you, if you are an investigator or study coordinator conducting human research protocols. You will be notified in advance if you are selected to talk to AAHRPP site visitors. Their questions will focus on the mechanisms in place at our organizations and in your own research program to protect study participants.

An Advisory Board, led by Dean Bienenstock and Associate Dean Arvin, is helping to prepare for AAHRPP review and on-site evaluation. Members of the board are:

- Steven Alexander, MD, Director of ACCESS
- Penny Eckert, PhD, Chair, Non-medical IRB
- Harry Greenberg, MD, Senior Associate Dean of Research
- Rodney Johnson, JD, Senior Medical Center Counsel
- Steve Jung, Director, Internal Audit and Institutional Compliance
- Rick Kraemer, MD, Associate Chief of Staff, VAPAHCS
- Nancy Lee, RN, Vice President, Clinical Services, Stanford Hospital and Clinics
- Steve Leibel, MD, Medical Director, Stanford Cancer Center
- Vicki Link, RN, MBA, Director, LPCH Quality Management
- David Magnus, PhD, Director, Stanford Center for Biomedical Ethics
- Kathy McClelland, Director, Research Compliance Office
- David D. Oakes, MD, Chair, Medical IRB Panel #1

- Paul Yock, MD, Professor of Medicine-Cardiovascular Medicine, Bioengineering

Watch for updates and more information about AAHRPP in upcoming newsletters and announcements. Any immediate questions can be directed to: kathy.mcclelland@stanford.edu, 723-4697.

Differentiating the Cancer/Stem Cell Institute and Comprehensive Cancer Center

In December 2002 I announced the establishment of the Stanford Institute for Cancer/Stem Cell Biology and Medicine – the first of our four Stanford Institutes of Medicine. At that time the association of cancer and stem cell biology in a single institute made sense and seemed opportune. Cancer cells and stem cells share the common characteristic of self-renewal, and there seemed to be significant potential for convergence of the fields of cancer biology and stem cell biology in shedding light on each other and in the prospect of therapeutic insights and opportunities. Since then several important events have transpired. One, of course, was the passage of Proposition 71 in November 2004 and the formation of the California Institute for Regenerative Medicine (CIRM). The second has been our evolving efforts in planning to apply to the National Cancer Institute to become a designated Comprehensive Cancer Center. As reported in the June 13th Dean's Newsletter, our current plans are to submit our application to the NCI in February 2006.

While there remains considerable and appropriate overlap in the scientific underpinnings of cancer biology and stem cell biology – and it is likely that Stanford will be especially recognized for elucidating these interconnections – it is also clear that this titular connection engenders confusion.. Accordingly, to provide clarity we have decided to create a nominal separation between the two. Effective immediately, Stanford Institute for Cancer/Stem Cell Biology, which heretofore has included our planned Comprehensive Cancer Center, has been renamed as follows:

- ***The Stanford Institute for Stem Cell Biology and Regenerative Medicine*** will encompass our broad programs in stem cell research as well as the Program in Regenerative Medicine. The Director of the Institute will be Dr. Irv Weissman, the Ludwig Professor; the Associate Director will be Dr. Mike Clarke, who will be officially joining the School in September 2005 from the University of Michigan. The Program in Regenerative Medicine includes initiatives in Education (led by Dr. Minx Fuller), Research (led by Dr. Roel Nusse), Stem Cell Policy (led by Drs. Linda Giudice and Julie Baker), Bioethics (led by Dr. David Magnus) and Facility Planning (led by Dr. Michael Longaker). Dr. Michael Longaker serves as the Program Director. Of note, the Institute and Program have a close affinity to the current and future efforts of the CIRM.
- ***The Stanford Comprehensive Cancer Center***, which we hope will soon achieve an NCI designation, will include the programs and cores being developed for our planned application to the NCI in February 2006. Dr. Irv Weissman will be the Principal Investigator and Dr. Bev Mitchell, recently recruited from the

University of North Carolina, will serve as the Deputy Director and Co-Principal Investigator. Dr. Karl Blume, who has been so incredibly instrumental in bringing forth our collective efforts for the NCI application, will serve as a Senior Program Advisor for the Comprehensive Cancer Center. They will be joined by several Associate Directors including Dr. Steve Leibel (Clinical Research), Dr. Mike Cleary (Basic Research), Dr. Ronald Levy (Translational Science), Dr. Dee West (Population Research), Yanru Chen Tsai, PhD (Shared Resources) and Ms Joanne Murphy (Administration).

I hope that this change will provide clarity to those who were confused about the connections between cancer and stem cell biology, and in particular about our institutional commitment to each of these areas. There is little doubt that there are – and should be – scientific, educational and patient care overlaps between these disciplines, as there will be with stem cell biology and our other three Stanford Institutes of Medicine. However, it is also true that making these efforts discrete will help us to communicate more effectively with those communities who are less familiar with our initiatives and unique research agendas.

California Health Care Institute Advocacy in Sacramento

In conjunction with other selected members of the Board of Directors of the California Health Care Institute I visited Sacramento on Monday June 13th to meet with the Governor's Executive Cabinet regarding issues of interest to the academic and biotechnology communities. One of the most important issues is our commitment to innovation. My task was to address the importance of the National Institutes of Health (NIH) in supporting academic research and our concern that the current downturn in the NIH budget will have deleterious effects on the California biomedical research enterprise. While we all celebrate the doubling of the NIH budget that was achieved in 2003, we have now witnessed two years of funding that has barely kept pace with inflation. Of concern is that the President's FY06 budget for the NIH provides less than a 1% increase, which is well below inflation and which decreases the amount of actual research dollars available. Despite the fact that Stanford can boast the highest amount of NIH research support per faculty member of any school in the nation, our real concern must be the support available to young faculty who are seeking their first competitive RO1. At a time when the biomedical research engine has perhaps the greatest promise ever, we face a period when the ability to support and develop new faculty is challenged. The consequences have enormous implications for academia as well as for innovation and thus are of interest to the Governor and the state.

Last year the Governor wrote to the President on behalf of NIH funding and it is our hope that he will do so again. Obviously advocacy for improving NIH funding is something that should be pursued through our individual and collective efforts, including through our various professional societies. Of concern is the fact that, whereas the NIH has long had strong bipartisan support, its recent tarnishing, especially in the area of conflict of interest, has the potential to impact adversely on the support it so needs to be successful.

This is yet another reason to pay careful attention to the impact of public perception on science and medicine.

Honors and Awards

- **Stephen Baccus, J.D., Ph.D.**, Assistant Professor of Neurobiology, was recently chosen as a 2005 Pew Scholar in the Biomedical Sciences. This award has been coveted for its intended flexibility, as it is designed precisely to enable scientists to take calculated risks, expand their research and follow unanticipated leads. Congratulations to Dr. Baccus!
- **Roger D. Kornberg**, the Mrs. George A. Winzer Professor in Medicine, received the Alfred P. Sloan Prize for his discoveries involving the inner workings of RNA and the role of genes as a cause of cancer. The Sloan Prize is given by the General Motors Research Foundation for contributions in basic science related to cancer research. Congratulations to Dr. Kornberg!
- **Dr. Eric Knudsen**, Professor and Chair of the Department of Neurobiology will share the Peter Gruber Foundation 2005 Neuroscience Prize with Dr. Masakazu Konishi of the California Institute of Technology, for the work on sound localization and neural plasticity. Each will receive a gold medal and \$200,000 in unrestricted cash at the Society of Neuroscience's Annual Meeting on November 13th in Washington, DC. Congratulations to Dr. Knudsen!
- **Dr. Michael Longaker**, Professor of Plastic and Reconstructive Surgery, has been named the recipient of the prestigious 2005 Joan and Julius Jacobson Award from the American College of Surgeons (ACS) in recognition of "an outstanding surgeon engaged in research advancing the art and science of surgery." The award will be presented at the fall meeting of the ACS. Congratulations to Dr. Longaker!

Appointments and Promotions

- **James Brooks** has been promoted to Associate Professor of Urology, effective 7/01/05.
- **Randy Buckner** has been appointed to Professor of Psychology, effective 9/01/05.
- **Sheau-yi Hsu** has been reappointed to Assistant Professor of Obstetrics and Gynecology, effective 9/01/05.
- **Lei Xing** has been appointed to Professor of Radiation Oncology, effective 7/01/05.

Dean's Newsletter

July 25, 2005

The Question of Gifts from Pharma

The July 15th issue of **The Wall Street Journal** contained a front-page article entitled “To Sell Their Drugs, Companies Increasingly Rely on Doctors.” It was ironic but relevant that this article, whose subtitle read “For \$750 and Up, Physicians Tell Peers About Products: Talks Called Educational,” was published on the same day as a presentation to the School’s Executive Committee on this very topic. While there is no doubt that the pharmaceutical industry (also known as Big Pharma) has developed medications that have significantly improved the lives of adults and children, there is also no doubt that pharmaceuticals are big business – and in fact the cost of drugs is one of the major factors contributing to the ever-rising cost of healthcare in America. And while there are very important relationships between Pharma and Academia (as well as the medical profession writ large) that should be acknowledged and supported, it is increasingly clear that the boundaries between proprietary interest and public good are getting too blurred.

In this context, the presentation by Dr. Gilbert Chu, Professor of Medicine and of Biochemistry, at the July 15th Executive Committee meeting was important and sobering in its elucidation of the relationship of the pharmaceutical industry and the medical profession. As you likely know, I have been commenting on some of these issues in recent Dean’s Newsletters, including the most recent one (see <http://deansnewsletter.stanford.edu/#1>), and I feel even more strongly after Dr. Chu’s talk that both collectively and individually we need to understand the relationship between Academia and Pharma and assure that it is managed with integrity.

Dr. Chu provided background about the huge scale and scope of Big Pharma. For instance, the ten biggest pharmaceutical companies worldwide account for 50% of worldwide sales. Among Fortune 500 companies, the 10 pharmaceutical companies in a recent year posted a combined net profit of \$36B, while the other 490 non-pharma companies had a combined profit of \$34B. The CEO salary plus stock options at one company were reported as \$151M; at another, the figures were \$82M. Amazing numbers!

Of course there is no question that pharmaceutical companies are essential for bringing new drugs to market. It is important to remember, however, that the basic research in identifying drug targets and candidate classes is most often done in academia or biotech, whereas pharmaceutical companies complete the drug evaluation process, support the clinical trials and secure FDA approval. However, questions about financial conflicts of interest in physicians’ relationships with the pharmaceutical industry have recently become more pointed. Books such as Jerome Kassirer’s, *On the Take, How Medicine's Complicity with Big Business can Endanger Your Health*, Oxford University Press, September 2004, have cast serious doubt on the integrity of the relationship between medicine and big business.

Dr. Chu explained that the business strategy of Big Pharma includes several components: making new drugs, patenting the drugs, lobbying lawmakers, educating patients, and educating physicians. Each of these components can be used to increase the profits of the company while only marginally, or not at all, increasing the health of the population. For instance, after one drug is patented and marketed and is making a profit, a “me too” drug (basically the same drug, with a slight variation in biochemistry but virtually no difference in efficacy) can be patented and used to enlarge the market - and generate new profits. Dr. Chu pointed out that the pharmaceutical lobby is the largest in Washington DC, with 1274 registered lobbyists, including 40 former members of Congress. The industry spends \$12B per year (\$10K per MD in this country) on physician education. Dr. Chu noted the ubiquitous presence of gifts of pens and food at seminars and the financing of 60% of CME by pharma.

Dr. Chu’s findings show that pharma has changed significantly over the past 25 years, away from finding novel drugs and towards aggressive marketing, and he is concerned that the pipeline for new drugs is drying up. Indeed, these issues foster the increasing practice of marketing drugs through TV ads (which are distressing in their own right) to the increasing role of using physicians (including academic physicians) to “market” drugs through “education” sessions – including those highlighted in the Wall Street Journal article mentioned above. I would go further and add that being on a “speaker’s bureau” or program blurs the lines between scholarship and business.

One of the most egregious current practices, and one that has become increasingly common, is the drafting of scientific reports on clinical trials by the drug company sponsoring the trial or by consultants with the expectation that the clinical scientist doing the trial will simply sign off on the article and have his/her name as the author. It is my hope that no faculty member at Stanford would engage in such a practice. Such ghost-written manuscripts (especially when the ghost is Big Pharma) are incompatible with rigorous independent scholarship.

Dr. Chu concluded his presentation with a series of questions that ask, “What should Stanford do?” Should we ban gifts from pharma? Do we want pharma food at seminars? Should we ban pharma from clinics? Can we mandate effective disclosure? How do we ensure good science in our research collaborations? These indeed are extremely important questions that deserve our attention. It is my plan to readdress these issues with the Executive Committee in the months ahead. In doing so, I am most interested in also getting input and comments from faculty and students. So please share your reactions, thoughts and recommendations with me.

NIH Reauthorization

During the past year, Ryan Adesnik, Director of Federal Relations, and I have been concerned about the potential impact of the reauthorization of the NIH – which we knew might be forthcoming. For the first time in 13 years, the House of Representatives began consideration of legislation to reauthorize the NIH. Reauthorization legislation consists

of a broad based policy review of the agency. Given federal budgetary constraints, and in follow-up to the 2003 IOM report, “Enhancing the Vitality of the National Institutes of health—Organizational Change to Meet New Challenges,” the House Committee with NIH oversight authority is now considering proposals to improve planning and efficiency at the NIH.

Last week the House Energy and Commerce Committee released a draft bill to begin the reauthorization process. Many of the important details of the proposal are currently under negotiation so it is probably best to consider the discussion draft as a work in progress. The committee asserts that it has tried to draft a document that seeks to enhance the NIH’s ability to develop planning across the NIH, strengthen the NIH Director’s authority to coordinate the NIH’s research portfolio, and direct the development of standardized reporting requirements and data collection to promote greater accountability to Congress and the public.

The Energy and Commerce Committee draft specifically proposes:

- The creation of a Division of Program Coordination, Planning and Strategic Initiatives within the Office of the Director that would be tasked with developing broad based, trans-NIH planning for the agency.
- The organization of the NIH, for funding purposes, into four divisions: 1) Mission Specific Institutes—focusing on disease specific efforts; 2) Science Enabling Institutes and Centers—defined in the committee’s proposal as those entities that provide support and tools to assist the efforts of the mission specific institutes; 3) The aforementioned Division of Program Coordination, Planning and Strategic Initiatives; and 4) Office of the Director.
- Giving the Director the Authority to reorganize institutes and centers with the consent of the HHS Secretary, Congress and a public process yet to be defined. The HHS Secretary currently has this authority.
- An increase in the amount of funding that the Director may transfer between institutes and centers for the purposes of implementing trans-NIH initiatives. The Director’s transfer authority is currently set at 1%.
- Uniform reporting requirements and improved data collection across the NIH to improve transparency.

Last week NIH Director Elias Zerhouni testified before the Energy and Commerce Committee to provide his comments on the discussion draft. Dr. Zerhouni indicated that, while there are many important details to be worked out, he believes the committee’s general approach would benefit planning and operations at NIH. He also stressed the importance of preserving the sanctity of the peer review process and support for investigator driven grants.

As noted above, over the last year I have been monitoring discussions regarding a possible reauthorization bill in Congress. While I think that the discussion draft seems to support some recommendations from the IOM report and some ideas that many of us support (i.e., some increased authority for the Director and better data collection and portfolio management) we have to work to make sure that any changes enhance the NIH's research mission rather than disrupt it. A number of members on the Energy and Commerce Committee stated last week that the NIH is not a "broken agency" and urged caution in any reform proposal. In particular, I have been very concerned about changes that could further erode the RO1 research pool.

The process is in its very early stages and it is still unclear how Congress will proceed. At our suggestion, the AAMC set up a Dean's Task Force to develop a constructive approach to provide input if such a reauthorization proposal began to move forward in Congress. I chair that task force with Dr. Bob Kelch from the University of Michigan. I will continue to work within that group, with the Association of American Universities and with other groups in the biomedical research community to provide reasoned input.

If you have any questions as the process moves forward please do not hesitate to contact our Director of Federal Relations, Ryan Adesnik at radesnik@stanford.edu. Information is also available at this AAMC web site:

<http://www.aamc.org/advocacy/library/washhigh/2005/072205/start.htm#1>

Mini-Retreat to Further Enhance the Progress of the Stanford Institutes of Medicine

On Saturday July 16th, I held a "mini-retreat" with the directors and associate directors of the Stanford Institutes of Medicine and the Stanford Comprehensive Cancer Center, to gather updates and status reports on each of the Institutes and, importantly, to address several key questions:

- Which projects now under the auspices of the Institute or Comprehensive Cancer Center (CCC) would be (or not be) in existence if the Institute or CCC did not exist?
- What activities are ongoing or planned to foster and develop Institute or CCC education and training programs?
- What lessons have been learned from launching the Institute or CCC and how can this benefit other Institutes?
- What is truly unique about each Institute or CCC and how is that distinguished from the work of Departments? How can the Institutes work more closely together and how can they collaborate with the Departments?

Attending the mini-retreat were Drs. Mark Davis and Carlos Esquivel (Stanford Institute for Immunity, Transplantation and Infection), Drs. Bill Mobley and Karoly Nikolich (Neurosciences Institute at Stanford), Dr. Bobby Robbins (Stanford Cardiovascular Institute), Drs. Irv Weissman and Mike Clarke (Stanford Stem Cell Biology and

Regenerative Medicine Institute), and Drs. Beverly Mitchell, Steve Leibel, and Karl Blume (Stanford Comprehensive Cancer Center).

The Mini-Retreat was highly interactive and successful in addressing the questions posted above and also in identifying important future challenges and opportunities. Among these is the importance of having the Institutes work more interactively with each other – including having regular meeting to update status, compare progress and determine areas for improved collaboration and interaction. There was unanimity in recognizing that the Institutes need to better engage faculty from throughout the university (although considerable progress on this has already been made) and to optimally align the work of the Institutes and CCC to the clinical and research programs in the Departments and Medical Center. The need to foster even closer collaboration with Stanford Hospital & Clinics and the Lucile Packard Children's Hospital was highlighted by a number of the Institute and CCC directors.

I fully recognize that the Stanford Institutes of Medicine and the Comprehensive Cancer Center represent significant change within the School and could be conceived by some as threats to existing organizational entities, especially departments. I don't see it that way at all. Indeed, I truly believe that strong basic and clinical departments are quite compatible with strong Institutes and the CCC. The challenge is to align structures and resources so that leaders across the School are able to see beyond the traditional boundaries of authority and control and are able to ask how these programs can make Stanford Medical Center stronger and more successful. At the end of the day our ability to be truly transformational will be decided by the quality and vision of our leadership throughout the School and by our individual and collective ability to create the future rather than defend the past. Needless to say, this will be an iterative process, requiring adaptation and compromise by all involved. But as stewards of the future, it remains our responsibility to assure that evolution occurs in a manner that enhances Stanford and furthers our ability to create new knowledge, train future leaders and translate discoveries.

Next Steps in the Faculty Appointments and Promotion Process

Last September I announced the launching of a Task Force on Faculty Appointments and Promotions, chaired by Dr. Rob Jackler, Professor and Chair of the Department of Otolaryngology-Head & Neck Surgery (http://deansnewsletter.stanford.edu/archive/09_07_04.html#8). The purpose of the Task Force is to examine our faculty appointments and promotions processes with a view toward streamlining them so that they can be completed more efficiently and quickly, with appropriate attention to the quality of the evaluation. I also asked the Task Force to assess the feasibility of using web- based technology for this process.

At the July 1st meeting of the Executive Committee, Dr. Jackler gave a progress report on the work accomplished to date. The Task Force has done an extensive review of the current A&P processes and has made a series of recommendations for change. Senior Associate Dean for Academic Affairs David Stevenson and I have approved these

recommendations, which will be implemented in the next months. For example, in conjunction with the Provost's Office, the School will be initiating changes in the forms used in the A&P processes. One good outcome is that there will be fewer forms, and the instructions for their use will be simplified and clarified. In addition, benchmarks for how well departments perform in accomplishing appointments, reappointments, and promotions will be established and tracked. Furthermore, the Task Force, under the leadership of Phil Constantinou, Director of IRT System Development, has completed a proposal for a Faculty Appointment and Promotion Web Application, which was demonstrated to the Executive Committee.

The objective of a web-based system would be to improve the speed of long form assembly and review by expositing the process steps to all the stakeholders, automating business rules to reduce errors and speed processing, and alerting responsible parties of delinquent tasks. Developing the full system will be a major project that would take several years to fully implement. The proposal is under review.

The Executive Committee was impressed by and enthusiastic about the Task Force's accomplishments. Dr. Jackler will return to the Executive Committee later in the calendar year, and I will keep you informed of further progress. Thanks to Dr. Jackler and the other members of the Task Force: Brian David, Sarah Donaldson, Jason Irwin, Linda McLaughlin, Julie Moseley, Annelies Ransome, Channing Robertson, Kim Thomas, Scott Walters and Kathy Gillam. Their work will have a significant positive impact on the school in the months and years ahead.

LCME Review Right Around the Corner

On July 20th the written documentation supporting our accreditation application by the LCME was sent to the Review Committee that will visit Stanford on October 16-19th. In addition to the 48-page Institutional Self Study Summary Report and the Student's Review, the application materials include over 3000 pages of background and supporting documents. The written documentation has been under preparation for more than a year and is the result of input from more than 200 faculty, students and staff within the School of Medicine as well as engagement by University officials and trustees. In thanking them, I also want to offer particular acknowledgement to Dr. Oscar Salvatierra, Professor Surgery and Pediatrics, who served as the LCME Faculty Lead, and to Ms. Rebecca Trumbell, our LCME Project Manager. Their efforts in coordinating this enormous project has been outstanding and I am deeply appreciative of their tremendous contributions.

We have received input on the written materials from our external advisors and have worked diligently to address the concerns or questions that they raised in their review. To refine our presentations, we will have a "mock site visit" in September and then, of course, use these experiences for the October visit.

I am fully cognizant that this LCME visit will take place under the shadow of past reviews, a number of which raised concerns, especially about library and education facilities. We in fact agree with the concerns that were raised and have worked diligently

to address these issues. I thought you might like to know what has been done to date and what will be accomplished in the immediate future. The following is abstracted from the LCME Self Study Summary Report. I share it with you so that you will be as informed as possible about this important issue.

The School has made an investment of over \$17.7 million to facilities since the 1997 site visit...the School has built and will continue to improve an IT infrastructure that allows ubiquitous electronic access to knowledge resources “anywhere, anytime,” recognizing the shift in balance from a library facility itself to an unlimited ability to access information; and finally, the School will build a new education facility, the Learning and Knowledge Center (LKC), which will provide the new kind of learning spaces and environment required by medical students today [and in the future]. The five component parts...have been addressed as follows:

1. Changes to the Lane Library facility itself include the elimination of a number of traditional book stacks to create expanded study spaces; the complete renovation and addition of handicapped accessibility to bathrooms within 44 yards of the entrance to the library; and the installation of evaporative coolers throughout the library building as a means of air conditioning. A number of other functional, comfort, and aesthetic upgrades have also been provided.
2. Small group teaching spaces have been created and/or renovated throughout the School in the Fleishmann teaching lab, the team learning classroom, anatomy lab, and Lane Library.
3. The Fleishmann teaching lab has been expanded and completely renovated, including sophisticated computer hardware.
4. The “computer network within the library” has been expanded, beyond what might have been even conceivable at the last LCME site visit, to become a “library without walls,” providing ubiquitous access to a greatly expanded digital biomedical collection. Within the library facility itself, all computer equipment and services, including hardware and seating, have been upgraded.
5. The lecture halls have been completely renovated and provided with modern audiovisual equipment.

When I came to Stanford as the new dean in April 2001, a plan (called the GALE project) had been in place to address the LCME’s prior concerns. However, it did not address the new programs for education that were to be developed in the School and it did not take into account the future of the library as a digital knowledge center. Moreover, the GALE project, a nearly \$200 million phased renovation project tentatively scheduled for completion in 2006, was unrealistic and did not have the support of the School’s faculty or the University’s administration. In February 2001 (before my actual official arrival), Michael Hindery, Senior Associate Dean for Finance Administration, and I met with the LCME Secretaries in Washington, DC. We informed them of my decision to scrap the

GALE project and focus on the development of educational facilities that would have more appropriate alignment with a new, more contemporary vision for knowledge management. Plans for the LKC have been formulated to accomplish these new goals and objectives. It will include facilities for large and small classroom teaching, simulation and virtual reality learning, and the knowledge center.

The School has completed program planning for the LKC, which has been presented to the Board of Trustees. This planning includes an anticipated groundbreaking date in 2007 and opening of the new building in 2009. (It should be noted that 2009 is also the 50th Anniversary of the School's move to the Stanford campus from San Francisco.) In contrast to the GALE project, the plan for the LKC includes 120,000 square feet of new construction in addition to 73,000 square feet for renovation of the Lane and Always buildings.

Taken together, the current renovations and revitalizations of existing space and the construction of state-of-the-art education and library facilities will further transform Stanford School of Medicine and prepare it for the challenges of the 21st Century. Of course I hope that these plans will also resolve the long-standing concerns of the LCME about the adequacy of our education facilities.

Update on Chair Searches of Clinical Departments

We presently have three searches underway for chairs of clinical departments. Each of these searches is important and they are at different stages of execution. The search for a chair of Obstetrics and Gynecology (chaired by Dr. Linda Shortliffe) has been underway since earlier in this calendar year and has identified potential candidates. I am currently reviewing that short list and hope to have an announcement about the selection in the not too distant future.

A second important search is for the next chair of the Department of Medicine, the largest and most complex department in the School. Drs. Harvey Cohen and Gary Glazer are co-chairing this search. The Committee is completing its needs assessment of the department and its description of the most desirable characteristics for the next chair. They have also assembled a long list of potential candidates and plan to develop a short list and begin inviting prospective candidates to campus in the Fall. It is my hope that we will be able to determine the lead candidate(s) before the end of this calendar year.

The third search is for the next chair of the Department of Pediatrics. Dr. Tom Kummel is chairing this search committee and, while they have only begun their work in the past month, they are already making significant progress. A long list of candidates has been compiled and the committee will be working on the shorter lists soon. The goal will be to have the next chair identified and hopefully at Stanford when Dr. Harvey Cohen steps down next summer.

In each of these searches, my goal is to find individuals who are established leaders and who can help move these respective departments to even greater levels of distinction.

Clearly each of these next chairs must have a significant background in science, research, education and clinical medicine. I am particularly interested in individuals with vision and the ability to implement important new programs. These new chairs will also need – and want – to work closely with their colleagues throughout the Medical Center and University. The parallel development of departments and our Stanford Institutes of Medicine constitute a particularly important opportunity. I am especially interested in future chairs who will foster interdepartmental collaborations in research, education and patient care and who will support and benefit from interactions with the Stanford Institutes of Medicine and the Stanford Comprehensive Cancer Center. The potential for positive results of these interactions are boundless, and they offer an opportunity to create a transformational future.

We have been very fortunate in recruiting new clinical chairs who fulfill these criteria and who have joined Stanford in the last couple of years. These include Drs. Rob Jackler, Chair of Otolaryngology and Head and Neck Surgery; Dr. Bill Maloney, Chair of Orthopedic Surgery; Dr. Bobby Robbins, Chair of Cardiothoracic Surgery; Dr. Frank Longo, who will join Stanford in January as the next Chair of Neurology; and Dr. Beverly Mitchell, who is joining Stanford as the Deputy Director for the Stanford Comprehensive Cancer Center. I hope and expect to identify individuals with similar qualities of leadership, vision and a spirit of collaboration – and who are eager to help make Stanford a true leader in academic medicine in the 21st Century.

Medical Student Life Advisor Sought

Dr Julie Parsonnet, Senior Associate Dean for Medical Education, asked me to include the following announcement in the Dean's Newsletter.

The School of Medicine is searching for a Medical Student Life Advisor who can provide guidance on matters that affect medical students, particularly non-academic and personal issues. This Advisor will be a medical student counselor and advocate and will be selected by a search committee comprised predominantly of students. Academic Advising Deans and the Student Life Advisor will work together closely in the development of the Advising Program. The Student Life Advisor will be a point of contact for students who wish to discuss sensitive or personal topics and obtain advice without concern about affecting their academic "reputation." The appointment will be for 25% time for a term of three years, with possibility for renewal at that time.

Responsibilities:

- Advise medical students on matters that impact student's life decisions, wellbeing, and academic performance, particularly non-academic and personal issues.
- Be available to represent and advocate for medical students, as appropriate, with regard to matters that affect student wellbeing.
- Work directly with the Academic Advising Deans in developing the Advising Program.

Qualifications:

- Training and experience as a practicing physician and educator.
- Extensive experience working with medical students, particularly in the role of advisor or mentor.
- Student-centered, personable, knowledgeable about the University and the School of Medicine.
- Associate, Full or Emeritus Professor at Stanford in UTL, MCL, Research, Teaching or Clinician Educator Line.

Applying

Prospective candidates should send a CV and a letter of intent to the Office of Student Affairs (OSA) to Zera Murphy [zera.murphy@stanford.edu] or Char Hamada [hamada@stanford.edu]. The names of three (3) students who could be contacted by the search committee for additional support of candidacy should also be included in the application material.

Application materials should be received before August 15th, 2005

America the pharmaceutical

The summer issue of Stanford Medicine, now available in print as well as on-line through the Communications and Public Affairs office Web site

<http://mednews.stanford.edu/stanmed/2005summer/>, includes a special report on the complicated relationship our society has with pharmaceuticals.

The issue examines "America the pharmaceutical" by exploring the nation's love/hate relationship with pharmaceutical drugs. While drugs are one of society's greatest assets, the public's faith in their reliability is in jeopardy. That's troubling because it strikes at the core of our health-care system. Meanwhile other developments, such as direct-to-consumer advertising, are feeding the public's demand for pharmaceutical solutions.

Among the contents in the special report are the following articles:

- An in-depth look at America's pharmaceutical drug habits and their implications.
- Analysis of the government's system for assuring drug safety, featuring insights from Stanford faculty and former Food and Drug Administration commissioner and Stanford president Donald Kennedy
- An answer to the question: Is it ever ethical to test drugs on children? David Magnus, director of the Stanford Center for Biomedical Ethics provides an explanation.
- A collection of facts and figures revealing the pharmaceutical industry's powerful place in society.
- The story behind the national effort to determine drug dosages appropriate for children. Lucile Packard Children's Hospital physicians are playing leading roles in this endeavor.
- Professor Steven Shafer's insider's perspective on the FDA panel on Cox-2 inhibitors

- A Q & A with futurist Faith Popcorn predicting the surprises pharmaceuticals have in store.

Awards and Honors

Dr. Ronald Davis, Professor of Biochemistry and of Genetics, is this year's recipient of the 2004-2005 Dickson Prize in Medicine. Awarded by the University of Pittsburgh School of Medicine, the Dickson Prize is intended for investigators who are "actively engaged in innovative, paradigm-shifting biochemical research that is worthy of significant and broad attention." The prize consists of a bronze medal and \$50,000, and will be presented this Fall in Pittsburgh. Congratulations to Dr. Davis.

Gerald M. Reaven, M.D., Professor of Medicine, Emeritus, has recently received the 2005 NAMS/Berlex Laboratories, Inc. Postmenopausal Metabolic Syndrome Research Award. This award is designed to recognize and acknowledge an individual whose body of research has made a significant contribution to the understanding of metabolic syndrome in postmenopausal women. A commemorative plaque will be presented on October 1 during the NAMS 16th Annual Meeting, to be held at the Manchester Grand Hyatt Hotel in San Diego, CA (September 28 - October 1, 2005).

Dr. Reaven has also been awarded the 2006 Fred Conrad Koch Award. This award is the highest honor bestowed by The Endocrine Society in recognition of exceptional contributions to endocrinology. The recipient receives the Fred Conrad Koch Medal of The Endocrine Society. Congratulations to Dr. Reaven for these well-deserved honors.

Robert Jackler, M.D., Professor and Chair, Department of Otolaryngology-Head and Neck Surgery, has been conferred honorary fellowship of the Royal College of Surgeons of Edinburgh, the highest accolade which the Royal College can bestow. Congratulations to Dr. Jackler.

Ian Whitmore, M.D., MB, BS, LRCP, MRCS, Professor of Surgery-Anatomy, received the Honored Member, 2005 Award in New York City at the 4th Joint Meeting of the American Association of Clinical Anatomists and the British Association of Clinical Anatomists. This award was given for his distinguished career in, and enthusiasm for, clinically-relevant anatomy and particularly in recognition of his work in Chairing F.I.C.A.T., (Federative International Committee on Anatomical Terminology), and making Terminologia Anatomica a reality. Terminologia Anatomica is the first and only complete listing of anatomical terms in both Latin and English. Congratulations to Dr. Whitmore.

Appointments and Promotions

- *Atul Butte* has been appointed to Assistant Professor of Medicine and Pediatrics, effective 9/01/05.

- **Clifford Chin** has been promoted to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 7/01/05.
- **Bruce Daniel** has been promoted to Associate Professor of Radiology, effective 8/1/05.
- **Samira Guccione** has been appointed to Assistant Professor (Research) of Radiology, effective 8/01/05.
- **Jaimie Henderson** has been appointed to Assistant Professor of Neurosurgery, effective 7/01/05.
- **Laura Lazzeroni** has been promoted to Associate Professor of (Research) of Health Research and Policy, effective 8/01/05.
- **Timothy McAdams** has been reappointed to Assistant Professor of Orthopedic Surgery, effective 7/01/05.
- **Andrew Quon** has been appointed to Assistant Professor of Radiology, effective 7/01/05.
- **Arend Sidow** has been promoted to Associate Professor of Pathology and Genetics, effective 8/105.
- **Karl Sylvester** has been reappointed to Assistant Professor of Surgery and Pediatrics at the Lucile Salter Packard Children's Hospital, effective 9/01/05.
- **Paul Utz** has been promoted to Associate Professor of Medicine, effective 8/1/05.

Dean's Newsletter

August 9, 2005

Planning the Future of Stanford University and the School of Medicine

Since it was founded in 1891, Stanford has become one of the great universities of the world. At its core, the excellence of its faculty and an outstanding student body define what makes Stanford truly great. While scholarship, discovery, innovation and education characterize some of the central components of the university of the past, the future will be increasingly defined by how a university creates knowledge to improve the human condition. Because Stanford has the unique advantage of housing all of its seven Schools (i.e., Business, Earth Sciences, Education, Engineering, Humanities and Sciences, Law and Medicine) on a single campus, the opportunities for interaction among faculty and students are wonderful. Coupled with a spirit of entrepreneurship and a remarkably broad interest in interdisciplinary research and education, Stanford is poised to serve as a leader

for the 21st century. Defining areas of overarching interest and interaction that will lead to improvements in human health and well-being has been the work of Stanford University leadership and faculty during the past several years. This work is now culminating in several major themes for the future. Among these are: Conquering Infection and Improving Human Health; Sustaining the Environment; Preventing Terrorism and Improving the Human Condition; and Educating Leaders for a Diverse and Complex World.

At a recent meeting of the Executive Cabinet - which includes the President, Provost, and School Deans - the leaders of the Stanford Environmental Initiative gave an update of their planning to date. As I described in an earlier Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/04_19_04.html#3), the genesis of the initiative was a group of committed faculty from across the University who came together in recognition of the urgent global sustainability challenges facing our world, the need for collaborative and interdisciplinary research to address these challenges, and the strengths we have at Stanford to do just that. The initiative has evolved to the point where it now defines itself as a University-wide Environmental Initiative with a new entity, the Stanford Institute for the Environment, as its centerpiece.

The new Institute's mission is to help societies around the world learn how to meet the demands of their populations for water, food, health, energy, and other vital needs while protecting and nurturing the ability of our planet to meet the needs of people today and in the generations yet to come. Institute faculty are currently developing strategic programs related to their mission and related goals. The Institute hopes to encourage governments, businesses and non-governmental organizations to apply environmental technology to problems, to use science-based expertise to identify solutions, and to develop interdisciplinary degree programs and leadership training for the next generation of leaders. Programs are being formed to develop new ways of conservation, generate sustainable solutions to global hunger, develop and promote the next generation of climate change solutions, and develop practical energy efficiency technologies and policies. There are plans to create new professorships, increase graduate student support, and secure funding for a dedicated building. And while the focus is clearly on achieving a sustainable environment, the linkage of this initiative to human health is also evident and will also likely develop more formally in the years ahead. Clearly these are very ambitious goals - I will provide further updates as the Environmental Initiative and Institute plans evolve.

Of course, the broad Initiative on Conquering Disease and Improving Human Health falls more specifically within the scope of the School of Medicine, and we have been working diligently to foster an exciting agenda for the future. Along with the initiatives in Bioengineering and Bio-X, we have been crafting our planning around the Stanford Institutes of Medicine and the Comprehensive Cancer Center. Both the institutes and the cancer center will link our basic and clinical faculty as well as colleagues from across the university in cross-disciplinary research and education. Our goal is to foster innovation and translate discoveries to our clinical partners at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. Indeed, during the past two years we have made

tremendous progress in defining these initiatives and, more recently, in codifying the resources that will be necessary to bring them to fruition. I will be presenting our integrated plans to the next Executive Cabinet meeting on August 24th and hope that this will generate considerable discussion and further refinement of our plans and goals. I will be eager to share these with you in future newsletters.

Continuing to Support the Pipeline for Diversity

Summer is a time when the School of Medicine's long tradition of helping minority and disadvantaged high school and college students learn more about science and medicine truly shines. Over the years a number of exciting and important programs have continued to offer these students an in-depth opportunity to learn more about themselves and how to prepare for a successful future. Among the notable programs are the Stanford Summer Research Program in Biomedical Science (SSRP), the Early Matriculation Program and the Health Careers Opportunity Program (HCOP) sponsored by the Stanford University School of Medicine Center of Excellence.

On Friday July 30th, I had the opportunity to attend the HCOP Celebration of Achievement Ceremony. This summer program has been led by Program Director Dr. Ron Garcia and Associate Director Kathryn Fitzgerald. This year 22 students from colleges and universities across the nation attended HCOP. They spent six weeks learning about anatomy and cell biology as well as the processes involved in applying to medical school and pursuing a career in the health sciences. Based on student comments and presentations, perhaps the most important thing they achieved was learning more about themselves and each other and fostering their sense of self-esteem. It was clear that each of the students who attended left with greater self-confidence and a greater resolve to follow their dreams and to succeed.

I want to thank the efforts of our faculty, students and staff in making these programs successful. They are each playing an enormously valuable role in helping a future generation to succeed.

Addressing Diversity More Broadly

In addition to the programs that help foster and stimulate a future pipeline of minority and disadvantaged students to become the physicians and scientists of tomorrow, we have another challenge to address. Namely, given the reasonably high level of diversity in our medical student class and increasingly in our graduate students (both as a result of committed efforts by faculty leaders over the years), we are still not doing anywhere as well as I would like in the diversity of our faculty. Indeed, this is true also for our resident trainees and postdoctoral fellows. While we are clearly training an outstanding and diverse medical and graduate student body, these students leave Stanford upon graduation, and this break in the pipeline at Stanford has a negative effect on the diversity of our postgraduate trainees and fellows. And clearly we are not doing enough to successfully attract minority graduates to our resident and fellowship programs and to our faculty. It was this concern that prompted me to launch a focused effort to enhance

diversity through the office of a Senior Associate Dean for Diversity and Leadership. During the past several months Dr. Hannah Valentine, the first incumbent of this important position, has been working with thought-leaders across the School to develop a plan to help overcome these imbalances and to enhance the diversity of our broader community. I will be happy to share that plan with you in the months ahead as it becomes more final.

In addition to recruiting more diverse postgraduate trainees and faculty, it is also clear that we need to work more diligently to assure that the environment at Stanford and the School is conducive to supporting a diverse community. Based on the Report of the Quality of Life survey commissioned in 2003 by the Provost's Advisory Committee on the Status of Women Faculty, we are in need of continued improvement, especially in meeting the challenges of work demands, particularly for our clinical faculty and for women and minorities. (The entire report of the Provost's Advisory Committee on the Status of Women Faculty may be found at:

<http://www.stanford.edu/dept/provost/womenfacultyreport/PACSWF.pdf>). This too is another area that requires addressing and I am certainly committed to seeing us make progress in improving this in the future.

Money Matters

While the summer quarter seems to bring an air of quietude to the rest of the University, the School of Medicine and Medical Center has been in overdrive since Commencement in mid-June. In addition to the fact that July is really another beginning of a new year for academic medical centers thanks to the arrival of new interns, residents and fellows, summer also represents a time for finalizing budgets and related money matters in anticipation of the beginning of the next fiscal year – which occurs on September 1st.

During the past weeks the School of Medicine consolidated budget – which for FY06 is just over \$1 billion – has been finalized across all departments, institutes and administrative units in support of the School's missions in research, education, and patient care and related support services. As in recent years, we will continue to be in an investment mode, which means using unrestricted reserves to help launch important new programs and Institutes. This has been a tactical decision since it is also clear that unless we can demonstrate progress in the early development of exciting programs we will not be successful in leveraging them for major future investments from philanthropic sources.

As we did last year, we face the delicate balance between the need to support our ongoing missions in education and research, both of which require funds above and beyond those we receive from research grants or tuition, and the necessity to invest in new programs, in the recruitment of new faculty and in the significant capital needs we have now and will have going forward. Because there are more needs than resources available to support them, we need to think boldly, but also with some fiscal conservatism to assure that we stretch as far as we can go – but not beyond our supply lines.

Of course finding additional sources of support is critical if we are to be successful. As an academic medical center and university, the current financial sources available come

from tuition payments (which cover only about 50% of the cost of education), research grants and contracts (which cover only about 75% of the actual costs), and patient care revenues. The latter have been increasingly challenged in recent years – although it is important to note that the Medical Center’s clinical programs (hospital and clinics) have performed significantly better than might have been expected during the past three years. Additional financial revenue sources for the School of Medicine include payout from endowment, patent income and gifts. As is frequently the case, each of these sources operates somewhat autonomously and can be impacted by factors outside our control.

For example, while Stanford has done exceedingly well on a per faculty basis in competing for research dollars from the National Institutes of Health (indeed we are number one in the nation in this metric), we are concerned about the current decreases in the NIH research budget, which will, if the current trend continues, mean a risk of decreased funding for basic and clinical research from public sources. And, as noted already, even with full funding from the NIH, the School still needs to add 25-30% of the dollars to make the research operations whole. Similarly, while we are certainly pleased with the current performance of the clinical programs, we recognize that this cycle of improved revenues can, and most likely will, change in the years ahead because of modifications in Medicare or reductions in payments by providers along with the increased cost for drugs and technologies. So anticipating these changes is important – along with doing all that we can to compete successfully and alter or change adverse policies or programs.

Thankfully we seem to be on a better track in raising philanthropic dollars. While the FY05 fiscal year still has three weeks to go, we have already exceeded the record number of dollars raised in 2001. With the changes now taking place in the Office of Medical Development along with the integrated fundraising plans developed over the past year between the School and Stanford Hospital & Clinics (SHC), and between the School and Lucile Packard Children’s Hospital (LPCH) and the Lucile Packard Foundation for Children’s Health, I am very optimistic that we will see significant advances in this important activity in the years ahead. Of course this is critically important given the very large fundraising targets that the School has for programmatic development as well as facilities – especially the Learning and Knowledge Center and the Stanford Institutes of Medicine #1. Both of these facilities are critically needed, and I hope both will be completed by 2009. But to get that accomplished we will need major new gifts as well as the use of School (as well as department) reserves along with other sources of cash. These two projects are critical to our missions in education and research, and since our very future depends on them, we will have to work collaboratively to achieve them – despite the obvious sacrifices that may be involved.

On another positive note, we are very close to finalizing the plans for a new funds flow model with the leadership at SHC, the basic conceptual outlines of which I reviewed in the February 22nd issue of the Dean’s Newsletter (http://deansnewsletter.stanford.edu/archive/02_22_05.html). The new model will be actualized in the FY06 fiscal year. It will be reviewed in mid-August by the SCH Board of Director’s Finance Committee and at the end of August by the full Board. Hopefully

this new model – which creates an effective alignment between the School, faculty and hospital - will be much more successful than its predecessors. While the discussions have naturally had their challenges, I am appreciative to the SHC leadership for working collaboratively. While the new model is not perfect and will certainly require adjustments over the years ahead, it is much more rational than anything we have had up to now.

Another important activity we completed during June and July was the annual comprehensive review of faculty compensation. Indeed, based on the recommendations from department chairs, members of the Dean's group and I reviewed, as we do each year, the base, variable, administrative supplement and incentive component for every faculty member in the School. We do this to assess equity across faculty ranks, specialties and gender, and in regard to performance expectations. We also engage in comparisons with national benchmarks. Our report is advisory to the Provost, who has the final authority in approving faculty compensation. We do all we can to achieve the highest degree of fairness and integrity in this process.

These money matters are of course critically important to all of us. While we seek to be mission based, and we certainly view the School as different from a traditional business, the reality is that when there is no money, there is no mission. So finding that balance becomes crucial. My goal, of course, is to have sufficient financial resources to fund our programmatic initiatives, capital requirements and faculty compensation. While I certainly recognize the need for – and am seeking – additional sources of funds, we are still fortunate to have access to the resources we do at Stanford. And while money certainly matters, so do the many intangible resources that exist at Stanford – particularly our outstanding faculty, exceptional students, wonderful staff and the high degree of engagement and interaction with our partners in the Medical Center and across the University. Those factors matter a lot as well.

Reducing Peak-Hour Traffic On-Campus

The Provost has requested that all Schools examine the commuting practices of their faculty, staff and students, and develop plans to reduce peak-hour vehicle traffic. In a memo to members of the University Cabinet and University Management Group (UMG), he explained: "As you may know, we are required by the General Use Permit (GUP) to maintain a traffic level with no net new commute trips during peak morning and evening commute times. In 2001, we performed a study to determine a traffic baseline. Twice each year, we must repeat the study to determine if traffic has increased over the baseline. The good news is that, in spite of a significant increase in the number of university employees since 2001, we have managed to keep the number of commute trips below the baseline, thanks to the excellent job Parking and Transportation Services has done creating and marketing alternative transportation programs.

The bad news is that the last traffic study shows us very close to the limit imposed by the GUP, and the trends suggest we will soon exceed it unless we act aggressively."

The Provost goes on to ask that we take an initial step to identify commuting schedules of SOM members, which we have created a survey to address. The survey is very short--less than 3 minutes. We need virtually all faculty, staff and students to participate in order to have a full understanding of our current situation. If you have not already completed the survey, please immediately access the survey at <http://med.stanford.edu/survey/traffic>. You only need your SUNet ID and password in order to complete it. In addition, awards of \$100 are being offered for the five most original and creative ideas for reducing peak-hour traffic.

The Provost has many suggestions for reducing "trips, "which you may find helpful:

- Encourage commuting employees who live close by to walk or bike to work and enjoy the added health benefits that will result from this change.
- Offer appropriate employees the opportunity to adopt alternative work schedules, including 7 a.m.- 4 p.m., 7:30 a.m.- 4:30 p.m., or 9:15 a.m.- 6:15 p.m. Obviously, the employee's supervisor must first agree that the alternative schedule is consistent with job requirements in the office. Flex-time, staggered work hours or compressed workweeks may also work for certain employees and offices.
- Encourage employees to participate in one of the alternative transportation incentive programs:
 - The Eco Pass, which offers free transit on VTA buses, light rail, the Dumbarton Express and Highway 17 Express to eligible Stanford employees who work 50 percent or more.
 - The GO Pass, which offers free transit on Caltrain to eligible Stanford employees who work 50 percent or more.
 - The East Bay Express (AC Transit's Line U), which provides free express service from the East Bay (connecting with BART and the ACE Train in Fremont) to the university.
 - The Commute Club, which provides cash rewards up to \$160 (\$204 effective Sept. 1) to employees who agree not to purchase parking permits, as well as many other benefits, such as free hourly Enterprise car use, the Guaranteed Ride Home program, and reserved carpool and vanpool parking
 - The Vanpool Program, which provides numerous financial incentives for new vanpools.
- Recognize the constraints that may be placed on the work schedules of employees who commute to work by public transportation.

Please complete the survey yourself, encourage others to do so as well, and remember that as we improve our "trip" level, we are also improving the environment, the parking situation, traffic, and in some cases our own health!

Thanks to those of you who have already completed the survey!

Awards and Honors

Karl Deisseroth, M.D., Ph.D., Assistant Professor of Bioengineering and Psychiatry, is one of four recipients who has been awarded a Technological Innovations in Neuroscience Award for 2005-2007 by the McKnight Endowment Fund for Neuroscience. The awards pay \$200,000 over two years for research projects that seek to advance the field of neuroscience by developing new tools and techniques enabling deeper understanding of the brain.

Keith Humphreys, Ph.D., has been appointed to the Committee on Care of Veterans with Serious Mental Illness by the Department of Veterans Affairs Undersecretary for Health Jonathan Perlin, M.D. The Committee works closely with the VA Secretary and Undersecretary, and the U.S. House and Senate Veterans' Committees, to monitor and improve the quality of mental health care in the VA system.

Steven L. Shafer, M.D., Professor of Anesthesia at Stanford University and Adjunct Professor of Biopharmaceutical Science at the University of California, San Francisco, has been appointed by the Board of Trustees of the International Anesthesia Research Society to be the next Editor-in-Chief of the medical and scientific Journal, *Anesthesia & Analgesia*.

Appointments and Promotions

- **Tracy George** has been appointed to Assistant Professor of Pathology, effective 8/01/05.
- **Geoffrey Gurtner** has been appointed to Associate Professor of Surgery, effective 9/01/05.
- **Peter Hwang** has been appointed to Associate Professor of Otolaryngology, effective 8/01/05.
- **Richard Lafayette** has been reappointed to Associate Professor of Medicine (Nephrology), effective 8/01/05.
- **Maria Millan** has been appointed to Associate Professor of Surgery, effective 8/01/05.

- **Mindie Nguyen** has been appointed to Assistant Professor of Medicine, effective 8/01/05.
- **Stanley Rockson** has been reappointed to Associate Professor of Medicine, effective 11/01/05.

Impact of the Gulf State Tragedy

During the past week we have each been riveted to the reports describing the devastating tragedy that befell the Gulf States of Alabama, Louisiana and Mississippi in the wake of Hurricane Katrina. The immediate reshaping of priorities of individuals, as well as communities, cities and the nation, offers a sobering reminder of human vulnerability. Since we are a global community I am confident that many in our Stanford community have family, friends and colleagues who were immediately impacted by this extraordinary natural disaster. The rest of us simply resonate to the loss of life, homes, and communities – and to the reality that, while such acts of nature cannot be prevented, more could have been done to respond more rapidly and effectively to the hurricane's destruction. And of course we think about the events that will continue to unfold, including the families dislocated or destroyed and the rebuilding that will need to take place. I am particularly mindful of the very significant public health hazards that may emerge as the flood waters, which are contaminated with biological and organic waste and toxic debris, coupled with the hot temperatures and humidity, serve as an incubator for microorganisms, with the consequent risk for serious infectious diseases. This could be further worsened by increases in mosquito and other vector populations, which could create risk to more geographically dispersed regions as well.

Thankfully many individuals and communities from throughout the nation and the world are now responding to the disaster, not only in New Orleans but also in the Gulf cities and towns that were damaged by Katrina. Likely you may also be receiving calls from displaced colleagues and students. These calls raise the important question of how we can respond and help. On Thursday September 1st, I participated in an emergency

phone call with Elias Zerhouni, Director of NIH, who was charged to develop a consultation response unit, along with members of the Council of Deans from the Association of American Medical Colleges (AAMC). Based on that discussion and the communications that have followed, I want to let you know about several activities and updates that are relevant to our medical communities:

1. ***Public Health Response*** – This is being coordinated by the Center for Disease Control, in conjunction with the Institute on Environmental Health and the Food and Drug Administration. It will address, among other things, infection hazards, mosquito abatement, chemical/toxins, and mental health. Clearly, as noted above, some of these - especially infection and mosquitoes - have significant risks outside the area as outbreaks occur and patients and other people are transported or travel to other areas.
2. ***Medical Shelter and Regional Care*** - About 40 shelters are being created in the regional areas that will need to be staffed. This effort is being coordinated by the Department of Health and Human Services (DHHS), the American Hospital Association (AHA) and others. Currently patients are being moved to 12 surrounding states. As of the end of the week 2,600 patients had been moved, but it is anticipated that placement of an additional 10,000 may be needed. In addition, teams of medical providers are being sought and will be coordinated by AHA/DHHS. Local response units are being established, and I know that a number of individuals within the Stanford community have volunteered to help.
3. ***Physician Consultation Response Network*** - This was the focus of the call I participated in. The NIH has been charged to do this. A significant part of the effort will focus on patients with high risk, high acuity disease, such as cancer, transplant, etc. The NIH will collaborate with the AAMC to provide a physician consultation network. We were asked to provide the name of the person at each of our institutions who would serve as the coordinating individual. For Stanford, I have designated Dr. Eric A Weiss, Assistant Professor of Surgery (Emergency Medicine), who also leads our local Disaster Preparedness effort, to serve as our link to this national effort. Dr. Weiss will prepare a list of specialists who can be consulted on an “as needed” basis. We may also be asked to receive selected patients, although I think the possibility for this is relatively low.
4. ***Placement of Students, Residents and Fellows*** – I know that a number of you have been contacted by students from Tulane, LSU and South Alabama School of Medicine who have asked about transfers. Similarly, post-graduate trainees including residents and fellows have also been making contact. We have been asked not to respond as individual institutions or programs since the AAMC and the ACGME will serve as coordinating leaders, along with the leaders from the affected schools. Information regarding the status of programs for students and postgraduate trainees is being posted on the AAMC website (<http://www.aamc.org/katrina.htm>). I am taking the liberty of including the latest information available below. Should you have inquiries regarding students please

refer them to Dr. Gabe Garcia (ggarcia@stanford.edu). For questions about postgraduate trainees, please contact Dr. Larry Shuer (lshuer@stanford.edu).

- a. **Tulane University School of Medicine** - Senior administrative staff are in discussion with their counterparts at Houston-area medical schools about the possibility that these schools would assist Tulane by providing medical education for Tulane students in all four years of medical education. Tulane officials also hope that similar plans for Tulane residents can be developed and implemented. Tulane administrators are currently in different cities, and they hope to have a face-to-face meeting in Houston as soon as possible to develop final plans for Tulane medical students, including plans for housing in Houston. They request that Tulane students monitor the AAMC Web site (www.aamc.org) for updated information, but indicate that more definitive information will most likely be available early in the week of September 5, 2005.
- b. **LSU Medical Students**- Message from Dean Hollier Regarding Resumption of Classes: First and second year classes are tentatively scheduled to resume Monday, September 26, 2005 on the campus of the Pennington Biomedical Research Center on Perkins Road. The Course Directors have worked out most of the details to accomplish this. Miss Bobbie Millet has made substantial progress in completing the fourth year schedule and will work individually with seniors to accomplish this. We will use the existing schedule for third year students and modify it for new clinical sites as they become available. Discussions with officials at EKL and UMC are well underway and it is anticipated that all students will be readily accommodated due to the large number of displaced patients. We will plan to move classes and rotations back to New Orleans by January 2006 as the infrastructure permits. We will be working to arrange appropriate housing. Some students have questioned whether they should arrange transfers to other schools. This will not be necessary. Please recognize that this disaster will only be a minor delay and will not jeopardize timely completion of your education. Please be in touch with Ms Bobbie Millet at 225-358-1073 or 225-358-1082 to arrange your schedule.

Obviously events will continue to unfold – hopefully for the better. But I felt you would appreciate these interim updates. Should more information unfold that is important for you to know, I will share it with you.

Welcoming the 2005 Entering Class of Medical Students

On Monday August 29th we officially welcomed the Entering Medical Student Class of 2005. This is always a time of celebration for the School and our incoming

students – although clearly a more sobering and reflective one in light of the events in Gulf States caused by Hurricane Katrina (see above).

Once again we have the privilege of welcoming an outstanding group of students. Our 86 incoming students were selected from an applicant pool of 5638, of which 362 were interviewed (including 314 candidates for the MD program and 48 for the MSTP [MD/PhD] program). Of this group 162 students were offered admission, for a yield of 52%. Including in the incoming class are seven students who had deferred enrollment from 2004.

The diverse demography of this year's class is evidenced by the fact that 47% are women, 28% are New Americans and 22% are "Under-Represented in Medicine." In addition to the USA, the birthplace of our incoming students include 19 countries and within the USA, 24 different states.

Incoming students pursued a wide array of undergraduate majors and come from 43 different colleges and universities. Of these, Schools with the highest number of represented students include Stanford (14), Harvard (12), Yale (7), Columbia (3) and two each from Cornell, UC Berkeley, UC Irvine, UCLA, MIT, the University of Michigan and the University of Pennsylvania. In addition, eight of our incoming students already have PhD degrees and six hold Masters in Science degrees. Perhaps most importantly, all appear to be enthusiastic, engaging and happy to be at Stanford. And of course, we are happy to welcome them.

The students had a detailed orientation from Monday through Wednesday that introduced them to an array of important topics and issues, including the Advising System, the New Curriculum, Scholarly Concentrations and the Practice of Medicine. We then had the opportunity to welcome our students (including three transfer students to upper classes), along with family and friends, at our annual Stethoscope Ceremony sponsored by the Stanford University Medical Center Alumni Association, the Arnold P. Gold Foundation and the School of Medicine. And then to make it all real, classes began on Thursday September 1st.

I want to thank Dr. Gabe Garcia and the Admissions Committee for their efforts in selecting an excellent class and also our wonderful Office of Student Affairs for helping to make everyone feel welcome – and oriented!

So, we are off on another academic year. In the next couple of weeks our upper class students as well as our incoming graduate students will arrive as well. Life has returned to the Farm.

Update on Plans for Becoming an NCI-Designated Cancer Center

We are continuing to make progress on our plans to become an NCI-Designated Comprehensive Cancer Center. As you likely know from prior discussions in the Dean's Newsletter (see http://deansnewsletter.stanford.edu/archive/06_30_05.html and

http://deansnewsletter.stanford.edu/archive/03_07_05.html) we are planning to submit our application in February 2006. To date we have received very encouraging reviews from our External Advisory Board. On August 25th we met with Program Officers from the NCI who visited Stanford and were also encouraging. While the positive feedback we have received to date is comforting, we all recognize that the only meaningful comments will come after our official review is conducted – likely in May or June 2006. But we do seem to be on a positive trajectory to date. For that we must thank, in particular, the faculty leaders of the proposed programs and cores as well as the leadership of Drs Irv Weissman, Bev Mitchell and Karl Blume, along with the administrative leadership of Joanne Murphy. While there are still lots of hurdles to cross, we seem to be on track and moving forward.

Importance of Expense Certification

At the September 2nd Executive Committee, Dr. Artie Bienenstock, the Vice Provost for Research and Dean for Graduate Policy, discussed the important issue of expense certification for federally funded grants and contracts. This is an area where anything less than 100% compliance is a failure. It is also critically important to the proper management of grants and contracts. Dr. Bienenstock reminded the Department Chairs and other School leaders that it is essential that all PIs certify expenditures on a quarterly basis. He also acknowledged that the information system conversion to Oracle during the past two years has made this process considerably more burdensome for all. Nonetheless, it is still essential that we achieve the goal of 100% expense certification.

There are a number of resources available to PIs in the School of Medicine for this process. If you have questions about your expenditure statements or specific expenses on those statements, you should discuss these with your department financial analysts or DFAs/Business Managers (whoever is reconciling the statements each month). If the financial analysts have questions regarding the legitimacy of an expense or understanding the data, they should contact their Office of Sponsored Research Accountant. Questions or concerns regarding overdrafts or accelerated spending should be directed to Mila Dacorro, Sponsored Projects Compliance Analyst in the School of Medicine Research Management Group, at mdacorro@stanford.edu or 498-7892.

In addition, suggestions for improving the way in which data are presented on the expenditure statements are welcome and should be sent to Anne Hannigan at ahannigan@stanford.edu or 723-1176.

Clinical Program Planning

As part of the integrated clinical planning activities between the School of Medicine and Stanford Hospital and Clinics, a strategic leadership group met on Friday afternoon, August 26th to review current status and future efforts. The group focused on regional issues. One of the important areas we are discussing is the plan for the new North Campus Facility in Redwood City that will open in 2007. This will be a state-of-the-art clinical ambulatory facility supporting faculty practice as well as education and

research. It will be outstanding new space featuring programs of importance to the Stanford University Medical Center that will serve patients from a broad regional area. Because of its accessibility and the availability of parking, patients and families will find it easier to get to than our main campus, and it will provide outstanding service. Over the next weeks Ms Martha Marsh, CEO and President of Stanford Hospital & Clinics, and I are meeting with the department chairs and clinical leaders of the programs that we believe will flourish at the Stanford North Campus facility. We will finalize those decisions later in September. We fully believe that this facility will provide a special opportunity for program growth in a patient-friendly environment.

In addition to the exciting developments for the North Campus, the School and SCH reached final agreement on the new Funds Flow Model, which was approved by the SCH Board of Directors on Monday August 29th. This represents a major step forward in further solidifying a productive collaboration and cooperation between the School and SHC. We believe it will improve our interactions and also serve as a model that will likely be replicated by other academic medical centers in the years ahead. The new RVU-based payment system for professional services became operative with the opening of the new fiscal year on September 1st.

In addition to inpatient and ambulatory program development and the alignment of our Stanford Institutes of Medicine and Stanford Comprehensive Cancer Center to the strategic clinical services at SHC (as well as Lucile Packard Children's Hospital), an increasing level of commitment and attention is being directed to the quality of clinical services. This is important in its own right, since quality of service must be viewed as being as important as the quality of the clinical care and innovation we provide. But it is also important in that quality of service will increasingly serve as a benchmark used to compare hospitals and clinical programs – and to determine payments for services. Indeed, plans are being finalized to link payments of physician services from Medicare to quality of service measures (see JK Ingelhart, NEJM 2005; 353: 870-872) – a process that is also being adopted by other payers. Traditionally, quality of service has not been a strong point for many academic medical centers, including Stanford, but this must change. The leadership of the Medical Center has a high level of commitment to assuring that we provide the highest quality of service, and an ever-increasing focus of effort and resources will be applied to assure that this takes place.

BioX and Innovation

On Wednesday August 31st another exceptional display of innovative interdisciplinary research was seen at the Bio-X Interdisciplinary Initiatives Symposium. Through its support of Graduate Student Fellowships, Postdoctoral Fellowships and related innovation awards, Bio-X has played an important role in bringing together faculty and students from the biological, physical, engineering and computer sciences. In many ways this activity serves as a fundamental underpinning of the interdisciplinary scientific research underway at Stanford. It thus helps to foster and stimulate the research and education programs now occurring in Bioengineering as well as in our School and University-wide Institutes of Medicine (i.e., Stem Cell and Regenerative Medicine,

Cardiovascular, Neurosciences, and Immunity/Transplantation/Infection) and the Stanford Comprehensive Cancer Center. There seems little question that these interdisciplinary interactions are promoting exceptional opportunities to discover fundamental new knowledge and, when appropriate, to translate discoveries to improve health.

NIH Announcement Regarding Loan Repayment Programs

I want to make sure that graduate trainees and junior faculty are aware of the NIH Loan Repayment Programs (LRP) that began accepting applications on September 1st. There are now five LRPs offered by the NIH, including the Clinical Research LRP, Clinical Research LRP for Individuals from Disadvantaged Backgrounds, Contraception and Infertility Research LRP, Health Disparities LRP, and Pediatric Research LRP.

Through these programs, the NIH offers to repay up to \$35,000 annually of the qualified educational debt of health professionals pursuing careers in biomedical and behavioral research. The programs also provide coverage for Federal and state tax liabilities.

To qualify, applicants must possess a doctoral-level degree, devote 50% or more of their time (20 hours per week based on a 40-hour work week) to research funded by a domestic non-profit organization or government entity (Federal, state, or local), and have educational loan debt equal to or exceeding 20% of their institutional base salary. Applicants must also be U.S. citizens, permanent residents, or U.S. nationals to be eligible.

For an online application, program information, or other assistance, visit the LRP Web site at www.lrp.nih.gov, telephone the Helpline at 866-849-4047, or send email inquiries to lrp@nih.gov.

Fall Forum 2005

I encourage faculty, students, staff, and community members to attend the 4th Annual Fall Forum on Community Health and Public Service. The keynote speaker this year will be Sheri Fink, MD, PhD, Stanford Alumna and author of "War Hospital: A True Story of Surgery and Survival." This event will be held on Tuesday, October 4, from 5:00 to 7:30 pm in the Frances C. Arrillaga Alumni Center, 326 Galvez Street.

The Forum is organized by medical students and highlights student contributions to community health through public service and community partnership research.

Awards and Honors

Matt Bogyo, Assistant Professor of Pathology and of Microbiology and Immunology, has been selected as one of the eleven awardees for the Burroughs Wellcome Fund 2005 Investigators in Infectious Disease Award. The Fund's selection was based on the

scientific excellence and innovation of the proposal, the strength of the scholarly environment at the institution, and Dr. Bogyo's accomplishments as an independent researcher.

David Gaba, Professor of Anesthesia and Associate Dean for Immersive and Simulation-based Learning, has been named as Editor-in-Chief of *Simulation in Healthcare: the Official Journal of the Society for Medical Simulation*. His accomplishments in the field date back to the mid-80s where he pioneered simulation as a technique to teach crisis management in Anesthesiology and later in a number of other specialties.

Allan Reiss, Howard C. Robbins Professor of Psychiatry and Behavioral Sciences and Professor, was presented with the Spirit of Excellence Award for Lifetime at the International Meeting of the National Fragile X Foundation in Washington D.C.. Dr. Reiss, an outgoing chair of the National Fragile X Foundation Scientific and Clinical Advisory Committee, is a leader in the area of understanding the interplay between the brain, genes, and the environment in fragile X syndrome.

Jim Spudich, Douglass M. and Nola Leishman Professor of Cardiovascular Disease, has been awarded the first U.S. Genomics Award for Outstanding Investigator in the Field of Single Molecule Biology from the Biophysical Society. This award recognizes work advancing the field of single molecule biology as demonstrated through innovative research, publications and other accomplishments related to detailing the properties, characteristics or behavior of individual biomolecules.

Appointments and Promotions

- **Frederick Dirbas** has been reappointed to Assistant Professor of Surgery, effective 9/01/05.
- **Stefan Heller** has been appointed to Associate Professor of Otolaryngology – Head and Neck Surgery, effective 10/01/05.
- **Mark Holodniy** has been promoted to Professor of Medicine at the Palo Alto Veterans Affairs Health Care System, effective 9/01/05.
- **Norman Lacayo** has been appointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 9/01/05.
- **Robert Lowsky** has been reappointed to Assistant Professor of Medicine (Bone Marrow Transplant), effective 10/01/05.
- **Michael McConnell** has been promoted to Associate Professor of Cardiovascular Medicine, effective 9/01/05.
- **Lynn Westphal** has been promoted to Associate Professor of Obstetrics and Gynecology, effective 9/01/05.

More About Katrina

By now the pictures, images, devastation and failures that surround Hurricane Katrina have become ingrained into our national – and global – awareness. While reports in recent days are beginning to speak more optimistically about the rebuilding of New Orleans, the reality is that hundreds of thousands of citizens have been displaced and whatever reconstruction occurs will surely take many months, or years, and will cost hundreds of billions of dollars. The outpouring of good will and help from private citizens and public agencies across the country and around the world is gratifying. Nevertheless, many things we take for granted in our daily lives will be challenging to obtain or simply unavailable to our friends, colleagues and fellow citizens along the Gulf Coast for some time to come. I am pleased to report that many of our faculty and community physicians, along with other health professionals, have volunteered their time to provide service to the affected Gulf community.

A week or two ago many in our community asked whether medical schools across the country should help out by taking Tulane and LSU students, residents and fellows who were “homeless” following the hurricane disaster. As I indicated in my September 6th Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/09_06_05.html), both schools had asked us to refrain from taking students while they assessed their future plans. That has now been done, and both Tulane and LSU have determined to remain open and to accommodate students and postgraduate trainees in programs they are re-establishing. To do this, Tulane is working with Baylor Medical School to support its preclinical students and, with the Texas consortium, to accommodate residents and fellows. LSU has moved its operations to Baton Rouge and is also clear that it wants to continue to support its own programs. Clearly our efforts should be to help Tulane and LSU achieve their goals. The Association of American Medical Colleges (AAMC) has played a central role in communicating these plans to the nation and also in helping to

serve as coordinating center and clearinghouse. During the AAMC Board meeting I attended on Sept 14-15, the leadership also proposed ways of using program resources to help support students and trainees.

What is unclear at this point is what will happen to the faculty at Tulane and LSU. While the NIH is doing all it can to assist grantees and whereas faculty may be able to relocate temporarily to other centers, the clinical faculty are without an immediate home. Because it will take time for displaced citizens to return to New Orleans, for example, the clinical faculty will face the challenge of a dearth of patients to care for – with the obvious economic implications and consequences. Clearly this will have an impact on the financial well-being of the entire medical school. Given the obvious pressures and challenges that will unfold, it is likely that many of these faculty will seek to relocate to other parts of the country – or will be recruited, perhaps even opportunistically. While we surely cannot interfere with the right of individuals to pursue new career options, we do need to be cognizant of the implications of the loss of clinical faculty from these programs and try to devise ways to help – and not compromise - their immediate future.. There is not an easy solution to this dilemma, although we did come up with several ideas at the AAMC , such as short term sabbaticals for displaced faculty, that might help to sustain the integrity of these medical schools. Additional thoughts are welcome.

CIRM Awards First Grants and Stanford Makes its Mark

Friday September 9th was a momentous day for the California Institute of Regenerative Medicine (CIRM) and its oversight Board, the Independent Citizens Oversight Committee (ICOC). And there was good news – especially for Stanford - as well as a persistent unfortunate reality.

The CIRM was born because a considerable majority of the citizens of California decided on Election Day, November 2nd 2004, to vote in favor of Proposition 71. With this vote of support, California assumed a leadership position in the debate on stem cell research and offered promise to its citizens and the nation that this important new area of research would be supported, at least in California. Indeed, when fully operative Proposition 71 will award \$3 billion of support for stem cell research in California over the next 10 years. And while a lot has happened since that momentous vote, the actual funding of research remains a promissory note – although one I have every confidence will be fulfilled. So while CIRM was officially born 10 months ago, it has not been given the life that our citizens voted for, primarily because of lawsuits filed by individuals and groups intent on stopping stem cell research.

So what has actually happened? The ICOC, which was officially appointed in December 2004 and on which I serve, has worked tirelessly to develop the infrastructure and guidelines to support outstanding stem cell research in California. Its financial resources are limited because the current lawsuits have held up the issuance of the bonds that will ultimately make the CIRM successful. Nevertheless, even in the face of this delay, the ICOC has accomplished a great deal. Perhaps most notably, the 29 member ICOC, comprised of leaders from academia, biotechnology and patient advocacy groups,

has worked with a real spirit of zeal and commitment to make the CIRM successful. Despite the sometimes relentless sniping in the press, the ICOC has identified an outstanding President in Dr. Zach Hall, and he, in turn, has appointed an excellent (although still skeleton) staff to run the institute. With input from numerous sources, the ICOC successfully carried out a competition for the permanent home for the CIRM, which will soon be located in San Francisco. The ICOC and CIRM helped generate a review on the “standards for conducting stem cell research,” initially under the auspices of the National Academy of Sciences and then through its internal Standards Working Group. Importantly, the ICOC worked diligently to develop the criteria for its grant review process and also to select the 15 member Scientific and Medical Research Funding Working Group, an extraordinary group of scientific and medical leaders from around the nation. This Group works in collaboration with patient advocacy members from the ICOC. The ICOC has also been working through other important issues related to governance, intellectual property and resource development, all while under fire from state legislators, legal groups and the press. Each of these groups has different motivations, but, regardless of their motives, none of this activity makes the efforts of the ICOC simpler or more successful.

And why was September 9th momentous for the CIRM? Simply because at long last the ICOC was asked to review the recommendations of the Scientific and Medical Research Funding Working Group on the 26 training grant proposals that had been submitted to the RFA from the CIRM (see the July 25th posting from the **Stanford Report**: http://med.stanford.edu/spotlight/archive/stem_cell_grant.html). The submissions were evaluated by the Working Group on the following criteria: the overall quality of the proposed training program, the qualifications of the program leadership, the research and training strength of the proposed mentors, the quality and diversity of the existing training programs, and the strength of stem cell research at the institution. Each proposal was carefully considered and then scored on a scale of 1-100, with 100 representing the best score for scientific merit. Based on the scientific ranking and then deliberative discussions with the disease-based patient advocate members of the ICOC, the final recommendations were brought forth to the ICOC. While the actual scientific ranking and related discussions took place in a closed session, all the remaining proceedings have occurred in public, and the results are published on the CIRM website.

Of the 26 proposals, 16 were recommended for funding (albeit several with reduced funding) and one with was approved “if funds were available.” When the recommendations were presented in a public meeting on September 9th, the ICOC discussed each proposal and voted, whether to accept or reject the recommendation of the Working Group. Individuals with defined conflict recused themselves from voting on certain proposals (e.g., I did not comment or vote on Stanford’s application). The recommendations were presented to the ICOC based on rating rank, with the highest score being 98 and the lowest “below 60.” I am very happy to report that Stanford’s score was 98. The public comments about the proposal noted that: ***“By all review criteria this application was deemed exceptional with the highest recommendation possibility. The program is of high quality and well integrated. The leadership and administrative support is strong and includes an internal executive committee and a committee of***

external advisors. The institution provides a strong environment that includes a hospital, medical school, and internationally recognized tradition in both adult and embryonic stem cell research. No obvious weakness was evident.”

Of course the success of the Stanford proposal is related to the outstanding faculty and staff who worked on the application. I particularly want to thank Dr. Michael Longaker, Deane P. and Louise Mitchell Professor of Surgery and Chair of the Program on Regenerative Medicine, along with Dr. Minx Fuller, Professor and Chair of Developmental Biology, and Dr. Irv Weissman, Karel and Avice Beekhuis Professor of Cancer Biology and Director of the Stanford Institute of Stem Cell Biology and Regenerative Medicine. Together with numerous colleagues in the School and University they brought forth a wonderful plan for training future investigators and leaders in stem cell research – and thus won the respect of an outstanding national review group.

While our Stanford proposal will eventually train six predoctoral, five postdoctoral and five clinical fellows and be supported by \$3,733,707 from the CIRM, the unfortunate reality is that no dollars will flow to us at this time. This is because the current lawsuits prevent the State from actually issuing the bonds that will fund the CIRM and its grants and programs. So, while we can celebrate an excellent review and an opportunity to begin training future investigators and leaders in stem cell biology and regenerative medicine, we must also mourn the fact that this important funding will be delayed until the lawsuits against Prop 71 have been dismissed. That said, it is important for our community and for the public to be aware that the CIRM and ICOC have done their best to honor the expectations of the citizens of California – something that a minority of individuals seem intent on thwarting. While I am confident that these current obstacles will eventually be removed, it is certainly unfortunate that we are losing precious time in moving these important training initiatives forward. But in the end I am also confident that reason will prevail and that Stanford will be able to fulfill its promise in training future leaders in stem cell research. Clearly this is important to Stanford, California and the nation. In the meantime, Drs. Margaret Fuller and Michael Longaker note that Stanford will begin holding a weekly seminar for all faculty members and students interested in regenerative medicine. The initial meeting is set for 4 p.m., October. 6th in the Clark Center.

Planning for the Learning & Knowledge Center

Plans are moving forward for the School of Medicine’s Learning and Knowledge Center (LKC) and the Stanford Institutes of Medicine #1. While there is considerable work to be accomplished, it is our current hope that both of these new facilities will be completed by 2009. At this point, we have completed the program planning for the LKC. We presented this work to the University Cabinet on September 15th as a prelude to presenting it to the Land and Buildings Committee of the Board of Trustees on Monday, October 10th. If we receive approval to proceed, we will begin architectural competition for the LKC. We would hope to select the winning architect by year-end or early 2006. Assuming that we are successful with the funding plans, the design and construction phases will move forward with the goal of occupancy for the class entering in 2009,

which is also the 50 year celebration of the School of Medicine's move from San Francisco to the Stanford campus in 1959.

At this point in the planning, the LKC consists of both new and renovated space. The new building (120,000 gross square feet (gsf) on the site of the current Fairchild Auditorium) will be designed to be the "front door" to the School of Medicine – something that certainly does not exist today. It will consist of a ground floor housing a new Conference Center along with three floors and a penthouse level. These will house the Learning Environments on the first floor, the state-of-the-art digital Knowledge Management Center on the second floor, the Center of Immersive and Simulation-based Learning on the third floor and on the partial fourth floor, a range of reflective and study areas including a no tech zone and rooftop garden. The LKC will be virtually connected to the renovated library, student services and related support services that will be housed on the lower floors of the current Alway and Lane Buildings.

Planning is also underway for the for SIM1, which will house departmental faculty (both current and new) who are members of the Stanford Institute for Stem Cell Biology and Regenerative Medicine, the Stanford Comprehensive Cancer Center and the Neurosciences Institute at Stanford. In addition, the 200,000 gsf SIM1 will house a vivarium that connects to the Research Animal Facility (RAF). Indeed, one of the additional important components for the construction of both the LKC and SIM1 will be the design of infrastructure "connecting elements." These will provide communications (likely underground) for these buildings and, over time, other integrative features that will help unify the School of Medicine facilities.

The design and construction of these facilities will be expensive and will include costs for construction, renovation, and special equipment, as well as for the construction costs now associated with the General Use Permit (GUP) and other requirements. The total costs are getting close to finalization and include, at this point, \$128.1M for the LKC and the associated renovations in Lane and Alway, \$151.2M for SIM1 and approximately \$50M for the infrastructure connecting elements. In addition, over the next 10 years, the School will need to support the renovation of the remainder of the Grant, Alway, Lane and Edward buildings for seismic upgrades as well new laboratories and administrative space. And, not even included here are our future SIM 2 and SIM 3, which are also important to our future success. Clearly these are major costs and addressing them will require bold and concerted efforts.

Without question, philanthropic gifts are one of the important sources of funding we must develop. This is one of the reasons I have worked hard to champion a bold plan that we hope will engage our community and friends to support our visions for the Stanford Institutes of Medicine, Comprehensive Cancer Center and Education and Library programs. If we are to be successful, we will also need to engage the participation, contributions and efforts of our faculty, students and alumni. I am pleased to announce that Dr. Paul Berg has agreed to co-direct the Education and Learning Volunteer Leadership Council and, in this role, to help coordinate and champion our philanthropic efforts for the LKC and related programs. Of course I have been deeply and

extensively involved with these efforts to date and will be dedicating an ever larger proportion of my time to meeting our various fundraising needs and goals (see also comments that follow below on Medical Development).

We will also be looking to funding sources beyond the efforts of the School's Office of Medical Development. The University will be contributing a significant level of the funds it raises centrally to our LKC and SIM1 projects because of their alignment with the SEMC (Science, Engineering and Medicine Campus). We will also be using a considerable amount of debt financing support for construction and renovation costs (although we will have to service the debt financing). In addition, we will be calling on our various reserve accounts, including those held centrally within the School and those held in departments, to further assist these efforts. Our hope here, however, is to raise sufficient funds from philanthropic sources so as to minimize the impact on school/departmental resources.

A number of schools of medicine facing major building projects have encountered a challenge similar to ours – namely, that sufficient capital funds have not been accrued from operations to cover the massive construction costs. A couple of years ago, Johns Hopkins Medicine put into place an infrastructure charge of 20% on all non-capital philanthropic gifts. This has proven to be an essential component of their ability to raise construction and renovation funds that could not be achieved from other sources. When I was in Boston, Harvard and its major teaching hospitals had similar infrastructure charges that ranged between 13-20%. At Stanford, the infrastructure charge has just been raised from 6% to 8%. While I realize that this is a notable change, we are planning to raise the infrastructure charge beginning in FY07 by an additional 5%, to 13%, for 5 years for all non-capital gifts. I am well aware that this will have an impact on faculty as well as donors, but it is an essential ingredient to our success – as it has been for other schools around the country. Nonetheless, having been a faculty member and department chair prior to coming to Stanford, I well appreciate the impact of such changes. But, like other peer schools, we have no choice but to move in such directions if we are to help secure our future as a leading school of medicine.

Today, Stanford Medical School is quite dichotomized in its physical plant. We have some wonderful new facilities (e.g., Clark Center, CCSR, Beckman, Lucas and MLS); others that are adequate but with significant limitations (e.g., Fairchild Science Building and Auditorium); and a still significant amount of largely suboptimal space (especially in the Stone Complex housing the Grant, Alway, Lane and Edwards Buildings). It is essential that we renew and redevelop our facilities by new construction (which, unfortunately, is limited by space constraints through the GUP) and renovations. We all have immediate needs and priorities, but part of our job, as institutional stewards, is to plan and develop the resources for future students and faculty. We all want to be part of an institution that we can be truly proud of – which must include the facilities that it offers to its students and scholars. The LKC and SIM1 and related renovations in Lane and Always are the first major steps in achieving our new and revitalized campus. There is much to do to bring these to fruition. But this still represents just the beginning of a long but important role for Stanford Medicine in the 21st century.

A Successful Year in Medical Development

I have noted in prior communications the planning underway to initiate a University-wide campaign that includes the School of Medicine and Medical Center. Indeed, we have made significant progress in developing an integrated fundraising plan that includes the School of Medicine and Stanford Hospital & Clinics and the School of Medicine and the Lucile Packard Children's Hospital. While we anticipate that the funds we raise will help all of our programs in the School, I recognize that to be successful, we need to be focused, and thus we have elected to concentrate in seven areas. These include our four Stanford Institutes of Medicine, the Stanford Comprehensive Cancer Center, Orthopedics and Sports Medicine, and Education. Each of these programs will require funds for new facilities and program development in research, education and patient care. I will have more to say about planning in these areas in the future.

But I want to report now that the School (and Stanford Hospital) enjoyed the highest level of fundraising activity in its history in the FY05 fiscal year, which ended on August 31, 2005. For the School of Medicine the total amount of new cash in FY05 was \$128M (compared to \$98M in FY04) – an increase of 30%. Equally, if not even more important, the “new activity” for FY05 (which includes pledges for future years) is \$116M compared to \$92M in FY04, an increase of 26%. This is excellent news! However, I would like to view it as just the beginning of our upward turn to significantly greater philanthropic activity.

Of course, raising new funds is not just about new money – it is about what those funds will be used for. For the School of Medicine, our goal must be to help nourish and enhance our mission-critical programs in education, research and patient care. At the end of the day, it is the lives that we affect and improve that will be the ultimate measure of our success.

I want to thank all those who have contributed to this year's success. First and foremost is our faculty, who do the wonderful and exciting work that so many individuals and foundations wish to support. I also want to thank our Office of Medical Development, a program that has been in significant transition. Mr. Doug Stewart became the Associate Vice-President for Medical Development in October 2004 and has done a wonderful job in focusing the team on our important fundraising goals. Further, he has been recruiting exceptional leaders and individuals to join the OMD staff who will clearly make major contributions in the future. But for this year, we must also thank the current and past members of OMD who have worked diligently and very hard to make a difference – which they indeed have. I also want to thank Mr. John Freidenrich, the leader of our new Leadership Council, who will certainly play a critical role in helping to guide our interactions with community leaders and supporters in the future. Finally, I want to thank the support and assistance of the Office of Development led by Martin Shell along with John Ford – their support and confidence has been wonderful and is much appreciated.

All that said, the new fiscal year began on September 1st and we have a new hill to climb. I remain deeply committed to working directly with our OMD and to do everything I can to help us achieve new and greater goals for this year and beyond. Naturally I will count on your help as well.

Update on the Center for Bioethics

On Thursday, September 8th the Steering Committee for the Stanford Center for Bioethics, chaired by Professor Hank Greeley, met to review the status, progress and future directions of the Center. Dr. David Magnus, Associate Professor of Pediatrics, reviewed the important accomplishments of the Center for Bioethics faculty in genetics, neuroethics, stem cell research and other important biomedical ethical issues. Despite the small size of the Center, under the leadership of David Magnus, the significant contributions of the faculty and members of the Center have attracted national praise and respect. This is measured by the Center's activities in hosting important consensus conferences, writing important opinions in leading journals, creating exciting documentaries and engaging the scientific and public communities around significant ethical dilemmas. The Center's leadership in prominent biomedical journals as well as high impact scientific journals, including *Science* and *Nature*, is particularly notable.

Importantly, the Center has had significant engagement in the education of medical students and undergraduates as well as bioscience students. The revamping of the required course on the "responsible conduct of research," which is now conducted in small groups, is an excellent example of progress. The role of the Center in the Human Biology Concentration in teaching "Foundations of Bioethics" is another excellent example.

In addition to research, scholarship and teaching, the Center also provides important services to our community. These include bench side consultations for investigators, clinical ethical consultations, grand rounds and service on important committees, including the stem cell efforts at Stanford as well as in California and nationally. Importantly, the Center has also developed a number of outreach programs to the community through opinion pieces in major newspapers, appearances, and lectures. All of these are directed at heightening awareness and understanding of significant ethical issues.

Women in Science

In the August 19th issue of **Science** (309:1190-1191) Jo Handelsman et al provided a policy forum update entitled "*More Women in Science*." This brief but important article underscored the fact that there is no convincing evidence to support a hypothesis that the representation of women in science is limited by innate ability. Between 1970-2003, there has been a 30-fold increase in the number of PhDs awarded to women in engineering. Despite this there remains a disproportionately low number of women in senior academic ranks compared to those who are entering the PhD pipeline. The authors offer four factors that likely contribute to this disparity and offer some

suggestions for dealing with it. Since I am committed to improving the career paths for women in the School of Medicine I believe it is important to take heed of these observations.

First, Handelsman notes that the pipeline challenge is not simply about numbers. Perhaps more importantly, it reflects the fact that women may not be encouraged to pursue academic careers or may lack sufficient female role models. To address this issue, specific programs designed to encourage female students that also prepare them to become faculty members are important. Along these lines, junior women scientists benefit from advice about how to invest their time and how to manage the requests for serving on committees, etc that may negatively impact their early career development (while not addressed in this report, I believe this applies to clinical science faculty as well).

Second, the authors note that women attribute their exit from academia to hostility from colleagues and “a chilly campus climate,” which may be less visible to me. While this may be difficult to measure, I believe it is likely operative at Stanford given the comments made by women in the 2003 Quality of Life Survey carried out by the Provost’s Advisory Committee on the Status of Women. I would hope that we have made some progress in addressing this but I would not, unfortunately, be surprised if it still persisted. Obviously this is something we must address more successfully.

In tandem with the “climate conditions” for women, Handelsman et al note the impact of “unconscious bias.” They cite data showing that evaluators give lower ratings on CV’s, journal articles, etc. if they are told that the person being assessed is a woman than if they are told the person being assessed is a man. Accordingly, it may be important to understand how to overcome such negative bias. This has been effectively done at some institutions and is something we should address at Stanford.

The fourth issue addressed by Handelsman et al is “balancing family and work” which, without question, remains a very significant challenge and for which the burden still falls too disproportionately on women. Here the broader University should assess its current programs and perhaps initiate new ones to further address these work/life balance issues.

As I hope you know, we are committed to making improvements in our programs in diversity and leadership. Our commitment clearly and prominently includes women in science and medicine. Dr. Hannah Valentine, who was recently appointed to serve as the Senior Associate Dean for Diversity and Leadership, has been developing a strategic plan that she and I both hope will provide programs to address issues like those discussed above. I will be sharing those with you in the coming months. But it is clear that our ultimate success requires broad institutional enlightenment and commitment at every level. I view this as extremely important and am counting on our entire community to contribute to these efforts. These are issues that should be important to everyone – and their solution will further enhance the quality of our School and University.

Future Physician Workforce

Over the years there have been a number of studies and reports about physician workforce projections. Most have turned out to be incorrect in one way or another. A somewhat different slant on this topic was presented at the Administrative Board Meeting for the Association of American Medical Colleges that I attended on September 14-15. Specifically, the discussion focused on the question of whether allopathic schools of medicine in the USA should expand by 10-15% to meet projected patient care needs anticipated during the next 10-20 years. These projections assume increased numbers of elderly patients and of individuals with chronic diseases.

At the present time, there are places for about 8000 graduates of non-LCME accredited medical or osteopathic schools in LCME certified graduate medical education programs. Put another way, approximately one-third of residency programs are being filled by students graduating from Caribbean (i.e., “offshore”) schools, which are not reviewed by the LCME or osteopathic schools within the USA (as well as some international schools). Both the offshore and the osteopathic sectors have been increasing in size during the past 10-20 years, while the number of allopathic medical schools has remained relatively static at about 125. The offshore medical schools account for 5% of the graduates entering LCME/ACGME approved residency programs, while the schools of osteopathy account for 11% of the individuals entering residency programs. Neither type of school follows the model of our allopathic medical schools, which are unique, of course, because of the research they perform and the research faculty who comprise them. In fact, most of the schools of osteopathy send their students to allopathic schools or hospitals for their clinical training programs. At the current time, only 64% of the graduates entering LCME/ACGME internship/residency programs come from our LCME accredited allopathic schools. This proportion has been decreasing as the offshore schools in the Caribbean and the schools of osteopathy increase their class size. Of additional note, the fact that the Caribbean and osteopathic schools do not have research programs, and in some cases do not even have significant clinical faculty, means that they are much less expensive to operate – and easier to expand.

So an important question is, if there is a need for additional physicians in the workforce, should they come from our allopathic schools or from other sources? We do know that these students perform far differently on the USMLE exams and that the GPA and MCAT scores of those entering offshore or osteopathic schools are far lower than those admitted to US allopathic medical schools. Indeed, most of the students pursuing offshore or osteopathy schools (between 63-94%) applied to allopathic schools but did not achieve admission. A related question, therefore, is what happens to the graduates from the nation’s Graduate Medical Education programs. Do those individuals who trained in the Caribbean schools or schools of osteopathy compensate for prior weaknesses by doing the graduate medical training in LCME/ACGME programs? And what kind of physicians do they become?

Interestingly, when I asked whether students entering Caribbean or osteopathic schools were more diverse or filled special niches, I learned that neither of these possibilities is the case. In fact, those entering Caribbean schools are less diverse, and the

financial situation is such that they have to have more resources to pay for their education than those entering US allopathic schools.

Further, while it is important to evaluate the workforce needs for physicians, it is also important to assure that, if we (as a nation) expand our class sizes, we really are meeting the important needs of the future. Clearly, these needs will include physicians doing clinical care, but it is not yet clear whether they will turn out to be needs in primary vs specialty care or in rural vs urban settings. In the past, expanding the numbers of graduates of medical schools has not necessarily altered the career paths chosen or the areas of the country where physicians have chosen to practice. Further, in addition to clinicians, we also need to assure that we are developing more physician-scientists for the workforce – an area of critical importance in its own right and of special interest to Stanford.

I share this information with you because I think it raises a number of important questions. Clearly we need more data regarding the outcomes from LCME/ACGME graduate medical training programs, as I mentioned above. But we also need to be clear about what we seek to achieve by expanding our workforce. If we decide to do so, should all schools participate? At this point, the AAMC is requesting that we increase our class size by about 15%. Should we do this at Stanford – and at what cost and with what goals? I am interested in your reactions, thoughts and recommendations.

Stanford Medicine Goes to Washington

On Monday, September 12th we hosted our first “Stanford Medicine in Washington” to inform and hopefully excite members of the press and the Congress on the exciting work that is going on at Stanford. Thanks to the efforts of Paul Costello, Executive Director of Communications and Public Affairs, and members of his staff, we put on a one-day symposium focusing on the general theme of Personalized Medicine. It was an excellent program, thanks to our faculty who traveled to Washington just for this session (<http://news-service.stanford.edu/news/2005/september14/med-seminar-091405.html>).

The program we presented was far-ranging and included the Future of Imaging and Molecular Imaging by Dr. Gary Glazer; Innovations in Cardiovascular Medicine by Dr. Charlie Taylor; Novel Approaches to the Diagnosis, Classification and Treatment of Cancer by Drs. Stephanie Jeffrey and Ron Levy; the Importance of Stem Cell Biology and the Discovery of Cancer Stem Cells by Dr. Mike Clarke (who is joining our faculty from the University of Michigan); Important Challenges in Health Care Policy and Ethics by Drs. Laurence Baker and David Magnus. I also gave a presentation on the Current Status of American Healthcare.

In an effort to further engage the press and Congress in positive ways, we are planning a similar visit next year, and we will also host a similar event on the West Coast in the spring. Not only is this type of outreach important in its own right, it should also help us in enhancing our efforts in medical development. Indeed I see a close linkage

between our efforts in communications, government relations and philanthropic activities. I want to thank our Communications and Public Affairs and Government Relations staff members and, of course, our faculty for their important contributions to this and related events.

Some Comings and Goings

- **Dr. Karla Kirkegaard.** I am very pleased to announce that Professor Karla Kirkegaard has been named the new chair of the Department of Microbiology and Immunology. Dr. Kirkegaard succeeds Mark Davis, who became Director of the Stanford Institute for Immunology, Transplantation and Infection earlier this year. Dr. Kirkegaard has been a member of the Stanford faculty since 1996, when she was recruited from the University of Colorado. She did her undergraduate work at UC Berkeley, received her PhD at Harvard and then did postdoctoral training with David Baltimore at MIT. She initially joined the UC-Boulder faculty in 1986 and began her work in the genetics and biology of viruses – especially polio, picornaviruses, coxsackie, and hepatitis C, among others. Some of her laboratory's recent work has emphasized studies of the mechanism of the poliovirus RNA-dependent RNA polymerase and its cooperative interaction with template RNAs, as well as the inhibition of protein secretion and evasion of the cellular immune response by nonenveloped RNA viruses. Dr Kirkegaard has also been Associate Chair of the Department since 2004 and has made numerous contributions to science, training, and the School. I am very pleased that Karla has agreed to serve as chair of Microbiology and Immunology.
- **Dr. John Boothroyd.** I want to thank Professor Boothroyd for the wonderful job he did as Senior Associate Dean for Research and Training during the past three years. His leadership and engagement in the important transitions taking place in the School of Medicine, including the establishment of our new Stanford Institutes of Medicine and a range of interdisciplinary research and education programs, have been notable. I am deeply appreciative of all of his efforts. Indeed John has served the School in a number of leadership positions during the past decade and understandably, at this juncture, has decided to refocus his efforts on his laboratory research and teaching. As a member of the department of Microbiology and Immunology, he will direct his energies to the study of the biology and genetics of *Toxoplasma*, an area where he has already achieved international acclaim. We will miss John and his very effective leadership, and I want to thank him again for all that he has done to support the School – and for all that he will do in the future as a prominent faculty member. Thanks, John.

Events

- Stanford University Medical Center's Community Lecture Series presents "Ears to You!" at 7 p.m. on Wednesday, October 5th in the Clark Center Auditorium.

Dr. Robert Jackler, Sewall Professor and Chair of the Department of Otolaryngology – Head & Neck Surgery, will discuss how advances in bioscience and technology promises to conquer hearing loss. For more information, call 650-234-0647.

- “National Health Cares About Domestic Violence Day” will be held on Wednesday, October 12th. On that day Stanford’s OB/GYN department will have displays representing different departments set up outside the hospital cafeteria. Healthcare professionals will be present, as well as educational materials and resources for the public, including a scenario CD for MDs on how to quickly and efficiently screen for domestic violence in a clinic setting, and a sample screening protocol.

Science and Medicine: The Converging Impacts of Public Perception, Money, Faith and Trust

A number of factors have been converging recently that are shaping the state of medicine and health care in the United States. Among these are the remarkable scientific discoveries of the second half of the 20th century and their impact on the practice of medicine as we know it today and as we think about it for the future. These form the fundamental underpinnings of modern medicine. However, along with these advances are the negative public perceptions of health care that are influenced by spiraling costs, limitations in access and concerns about quality and safety. Adding to these perceptions is the challenge by some faith groups to selected high profile areas of science that is occurring side-by-side with ethical violations, sometimes bordering on deceit, by the broader medical profession. Increasingly these convergences are being played out on the world stage, and they raise many questions about how we can – and should – find the path that will secure the future of the medical profession and the health of our nation.

During the post- World War II era, the biomedical research community in the USA, fueled by the expansion of the National Institutes of Health, grew in size, complexity and impact. Scientific progress has been remarkable, and we now have roadmaps to better understand the fundamental underpinning of life. Moreover, we can image and visualize biological functioning and use vast new bodies of information to compare and contrast human and non-human species and their evolution. Fundamental science has also led to significant and lifesaving or life-extending treatments for major human disorders that can be monitored and measured by sophisticated new technologies. And the promise for future knowledge acquisition is remarkable, especially with the increasing confluence of the life, physical, engineering and computational sciences. In these areas Stanford has played a major role to date and can be a leader for tomorrow.

Even while this progress unfolds, changing perceptions about science and medicine challenge and even threaten current progress and future opportunities. Among the most significant forces is the rising tide of anti-science sentiment that seems to have its nucleus in Washington but which extends throughout the nation and indeed the world as it follows political, religious and ideological channels. This sentiment has been expressed around now familiar themes: stem cell research; appointments to scientific advisory committees and leadership positions in federal scientific and regulatory agencies; and attempts by congress to criminalize certain types of research or to override peer reviewed funding proposals that conflict with religious or ideological positions. The anti-science sentiment is not simply political or even partisan and is being witnessed across all major religions, perhaps as an expression of the increase in fundamentalist thinking and a consequent more anti-secular perspective. The recent outcropping of “intelligent design” in the science curricula of schools and even college campuses is highly concerning – and is now brought directly into the broader public attention with the trial in Dover, Pennsylvania which recalls issues of some 80 years ago when the Scopes trial questioned evolution.

Moreover, the public perception of medicine as a profession has been altered by the negative impact of managed care and of the attempt to use market forces to deliver

medical care. This attempt has resulted in a focus on the price of care and the need for greater physician “productivity” – not infrequently at the expense of the time necessary to forge successful doctor-patient relationships. Added to this is the ever-increasing cost of care and of insurance, which have been fueled further by the rising costs of drugs in the USA. In addition, the public has become more aware of the financial and proprietary incentives motivating some large pharmaceutical companies that have sometimes resulted in selective reporting of clinical trials – or even in the suppression of the publication of negative results. These revelations, not surprisingly, have increased the level of public discontent with the medical and pharmaceutical enterprise.

Recent reports of conflict of interest by physicians, scientists, medical institutions, big pharma, etc., have only further damaged and challenged the public trust. Of course this is happening at the same time that most American citizens are reeling under the spiraling costs of their health care insurance payments. Ironically, despite the fact that the USA spends more on per capita health care than any developed nation (now above 15% of the GDP), on a population basis, the metrics of health care do not show the USA as a leader in outcomes other than for the amount spent on administrative overhead! Health care costs are driven by multiple factors, notably including technology, pharmaceuticals and administrative costs. It is reasonable to ask whether more spending would improve the quality of care and its availability. From my point of view that seems doubtful. Rather, it seems more important to control costs more rationally by using quality measures and evidence of benefit from technology rather than price competition. It is equally important, though, to develop mechanisms that make care more broadly available, so that we do not move even farther down the path of becoming a nation with different standards of care for those who can afford it versus those who cannot.

It is also important to recognize that these issues, including the impact of religion and faith as well as the economics and delivery of health care, are being played out on a global stage. This is certainly made clear by emerging infections and both natural and inflicted disasters. It is also accompanied by the shifting of technologies in a manner compatible with Tom Friedman’s thesis that “The World is Flat.” For example, the decision to withhold federal funding for embryonic stem cell research that moves beyond the August 9, 2001 limitations set by President Bush has shifted the development of this emergent research to other nations, most notably South Korea, China and the UK. While we have an opportunity to reverse this trend in California through the California Institute for Regenerative Medicine, the lawsuits that have been filed on largely ideological grounds have prevented the funding of Institute programs, with all the obvious consequences.

Interestingly, a similar shift of technology is also resulting in patients leaving the US to receive care rather than coming here, as was the case during recent decades. For example, specialty hospitals in India can perform selected procedures for a much lower cost yet with high quality outcomes. Clearly, the dominance of the USA in science and medicine is being threatened and eroded. While the impact to date is still small, the door has been open for additional migrations to occur in the years ahead.

So we are clearly at a crossroads. While we are investing considerable public as well as private funds in science and medicine, a number of political, faith-based and ideological forces are altering public perception and trust – and the outcomes of our current programs, not to mention the potential success of future programs. If the current patterns continue they can threaten our leadership in science, technology development and health care delivery. Certainly this is a time when individuals – and, where appropriate, institutions – need to speak up and change the agenda and its outcomes.

To begin, we must do all we can to assure that we sustain our investment in science. The current flattening of the NIH budget is highly concerning and is already resulting in a dropping success rate and lowering levels of grant support. History has taught us that we can lose a generation of young faculty if they are not able to compete successfully for the shrinking pool of NIH dollars. This can be made even worse if the NIH reauthorization, which could happen in the next congressional session, results in greater centralization of funding and fewer funds available for the RO1 pool. This is an issue I am actively working on; we will likely need your help and support as it evolves over the next several months. Naturally I will keep you apprised of this issue.

I believe we also need a radical change in our health care system. This was the topic of a recent issue of *Stanford Medicine* (see <http://mednews.stanford.edu/stanmed/2005winter/>). Whether we can accomplish this in a timely way or on a national basis is unclear. As an alternative, local or state explorations seem a prudent alternative. The current employee-based insurance mechanism is too expensive and quite erratic in its success. I have previously commented that we should be exploring alternatives, including a single-payer system, the voucher program recently championed by Dr. Victor Fuchs, or an extension of the Federal Health Benefits Program as recently promoted by former Assistant Secretary for Health, Dr. Julie Richmond. In tandem with such changes, there needs to be much broader public responsibility for health care and an awareness that wellness requires life style accommodation and change. The current epidemic of obesity threatening both adults and children is a good example of the need for personal and societal accountability. Both individuals and the broader society need to change to prevent the obvious morbidities that will arise from a lack of attention and action directed to reversing this epidemic. Other examples could be mentioned as well.

Without question we also need to address more directly the anti-science positions being taken in local and state communities as well as in national and federal settings. Some of this response needs to come from more forcefully challenging ideological positions based on politics and religion. These include positions that result in: legislation that would criminalize certain forms of research (e.g., somatic cell nuclear transfer); appointments to federal committees or positions; and positions by federal agencies that are not concordant with scientific data. Casting doubt on the efficacy of condoms to prevent infections and inordinately delaying the approval of Plan B contraception, despite the recommendation of a science based FDA advisory group, are examples of the latter. That said, it is incumbent on us to understand better the position of

individuals who have a different point of view and, as much as possible, to find common ground based on an honest assessment of the factual data.

We also need to recognize that a significant factor in the public distrust and dissatisfaction with medicine is the result of the breakdown or compromise of the doctor-patient relationship. Overcoming this rift will require physicians to spend more time with patients, to make human contact and to reach out with integrity and compassion. I fear that some of these qualities, which are sometimes categorized as the “art of medicine,” have been lost due to the high throughput philosophy of managed care and the reliance on technology to a degree that disconnected the physician from the patient. We need to teach and reclaim this important facet of medicine.

While I have outlined a number of important challenges to our state of health and science, I continue to believe that we can reverse these trends. Certainly at Stanford School of Medicine we must train and educate our undergraduate students and postdoctoral trainees about the important connection between medicine and science. We must help guide them to become the leaders of the future and advocates who can champion the integrity of science and medicine. I believe that Stanford can be a role model among academic medical centers at this time of tremendous challenge and change. I certainly look forward to working with you to find ways to use our knowledge, skills and care to discover, innovate, and improve the public trust.

Welcome to Our Incoming Bioscience Graduate Students.

This past week we welcomed our incoming class of Bioscience Students. The 132 new graduate students include both masters students and doctoral students who joined 14 different departments and interdepartmental programs. Of these, 83 students are entering 12 Bioscience PhD Home Programs. These include Biochemistry, Biological Sciences, Biophysics, Cancer Biology, Developmental Biology, Genetics, Immunology, Microbiology and Immunology, Molecular Pharmacology, Molecular and Cellular Physiology, Neurosciences and Structural Biology in addition to programs in Bioengineering, Bioinformatics and Health Services Research and Epidemiology. These outstanding students represent 13 countries and were accepted from some 52 colleges and universities, with strong representation by undergraduates from Harvard, Stanford, UC Berkeley, MIT, Princeton and other excellent peer institutions. This year’s yield rate was 54% - the third highest for Stanford Biosciences. In addition, 15 entering students are under-represented minorities. I am thankful for the exemplary leadership of Assistant Dean Anika Green, the new Director of Diversity in Biosciences Programs, in helping improve our recruitment and selection of a more diverse student body. And we are committed to making further improvements in this area in the years ahead.

More than 60 of our new graduate students spent the previous weekend at the BIOMASS camping trip, where they had the opportunity to begin getting to know each other. This past week featured welcoming orientations by Jessica Allen, Chair of BIOMASS, Dr. Ellen Porzig, Associate Dean of Graduate Education and Associate Professor of Developmental Biology and Yvette Estay, co-chair of BIOAIMS. Students

received orientation to key support and academic programs and became familiar with schedules, courses and retreats of Home Programs. In addition, they participated in a Panel Discussion on student life issues chaired by Christian Grandinaru, Peter Lee, Gilbert Martinez, ChaRandle Jordan, Manny Lopez and Alex Bankovich (BIOMASS leaders).

Special thanks to all who worked hard to make the orientation of our new graduate students so successful – and, in particular, Jessica Allen, Ellen Porzig, Yvette Estay, Zera Murphy, Suzanne Bethard, John Bray, Velessa Peairs and Shannon Monahna. Thanks also to Pam Lowney for some representative bio-introductions to some of our students on the School of Medicine Website Welcome to Our Incoming Bioscience Graduate Students.

Update on Medical Education

At the Medical School Faculty Senate Meeting on Wednesday, September 21st, Dr. Julie Parsonnet, Senior Associate Dean for Medical Education, gave an update on the programmatic efforts and accomplishments of the past year. She noted some of the significant thought changes that emerged from the 2004 Mission Committee, which she chaired. These thought changes are now affecting current program development. Members of the committee were Drs. Russ Altman, Terry Blaschke, Bill Mobley, Phil Pizzo, Judy Swain and Ted Sectish. Notable among these thought changes are the following:

- We should admit a diverse body of students who are interested in the intellectual substance of medicine and committed to advancing the field of medicine broadly defined.
- We should have high expectations for our students and faculty and demand rigor and excellence in the education program (She noted that “rigor is not to be confused with rigidity”).
- Stanford medical students should be trained to become excellent clinicians and, of equal importance, should engage in scholarship that fosters skills to advance the field of medicine.
- A broad component of the medical school faculty should contribute to the design and teaching of the medical school curriculum, with oversight of the Faculty Senate and the Office of Medical Education. The education core should be framed both by national guidelines and by faculty expert judgment.
- The faculty should teach and demonstrate the thought processes that create new knowledge, in addition to teaching that knowledge itself. The scholarly concentrations provide a venue for teaching the thought process. Other opportunities to teach the thought process must be balanced with the obligation to teach the large knowledge base required to become clinicians.
- Students must combine the breadth of medical education with depth in an area of individual interest under the mentorship of Stanford Medical School Faculty. Both breadth and depth are required for graduation.
- Our graduates should aspire to the most distinguished residency programs as one step towards careers of distinction.

Certainly these thought changes are impacting both the medical curriculum and the admissions process – a trend that will continue to be refined and focused during the years ahead.

Within this broad context, Dr. Parsonnet described a number of 2004-05 accomplishments that were an extension of the introduction of the New Stanford Curriculum in September 2003. Among these are:

- The successful implementation of Year 2 of the integrated curriculum.

- Adjustments and enhancements of the Scholarly Concentrations, including the introduction of two new offerings: Clinical Research and Cardiovascular.
- The initiation of the Applied Biomedical Sciences Program, which brings scientific offerings into the clinical years.
- A new required clerkship in Ambulatory Medicine.
- New standards for medical student performance along with a 360 course and clerkship evaluation process.
- In addition, an oversight process has been established for clerkship directors for student evaluation.
- Adjustments in the admissions process to better align it to the School's New Curriculum. This has been enhanced by the addition of a basic science chair and two clinical chairs to the Admissions Committee.
- Continued strengthening of the academic advising program. In addition a search is underway for a Student Life Advisor.
- Significant progress in improving learning spaces (while waiting of course for the future Learning and Knowledge Center).

These programmatic accomplishments have been accompanied by other results that suggest our efforts are moving in the right directions:

- As reported in the September 6th issue of the Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/09_06_05.html) the Admissions Committee presented a stellar group of new students this year and had a very high yield on the offers made.
- We continue to have a high interest of students in research and scholarship, and it is increasing.
- While this outcome needs to be interpreted carefully, it is the case that the first class entering the New Curriculum scored spectacularly on the USLME Step 1. Indeed, of the 64 students who took the exam, the pass rate was 100%, with a mean score of 237 and a median of 241. This is likely the highest score in the nation. Of course this result reflects the quality of the students taking the exam, but I believe it is also a sign of the impact of the New Curriculum on their knowledge base.

Despite this progress much remains to be done. Without question, the Faculty Senate and the Medical Education Group will continue to direct their efforts to further improving the quality and uniqueness of the Stanford Medical Education programs. I want to offer my special thanks to the many faculty and staff who have worked on these efforts – and especially to Dr. Julie Parsonnet for her leadership and vision.

Progress in the Biodesign Innovation Program

Led by Drs. Josh Makeover, Consulting Associate Professor, and Paul Yock, Martha Meier Welland Professor of Medicine and Co-Chair, Department of Bioengineering, the Stanford Biodesign Innovation Program has evolved as a model of innovation and collaboration. The program was originally designed to “provide the

knowledge and skills essential for the early development of new biomedical technologies. The program will enhance participants' abilities to identify new opportunities for innovation, to assess clinical needs and market potential and to take the critical first steps in the invention, patenting, early prototyping, and development of new concepts." The program includes a fellowship program and an elective course (see <http://innovation.stanford.edu/jsp/program/about.jsp>).

During the past year, a number of new and important accomplishments and additions have been added. For example, the fellowship program now includes two teams: the Surgical Innovation Team and the Cardiovascular Innovation Team. Each team has four fellows, and their achievements have been noteworthy. Indeed, since the Biodesign Innovation Program began in 2001, more than a dozen new technologies have been developed and the now nineteen alumni of the program have each gone on to careers in academia as well as in both large and small biotechnology companies.

On September 16-17, the Biodesign Innovation Program hosted a unique new event at Stanford called "Emerging Entrepreneurs in Biomedical Technology". In partnership with 39 industry and venture sponsors, the California Healthcare Institute, the Kauffman Foundation and the National Collegiate Inventor and Innovator Alliance (<http://www.nciia.org/>), the Biodesign Program launched a search for top young innovators in biomedical technology in its extended university-industry community. Of the 300 applications it received, 183 individuals were invited to an intensive two-day crash course in the realities of translating technology from bench to bedside. The program was extremely well received and the program directors plan to continue to interact with this group as a cohort with periodic "reunions" and updates.

To further the programmatic development, Biodesign and the Department of Bioengineering have recently recruited Dr. John Linehan, former Vice President of the Whitaker Foundation, to direct a new national web portal initiative in biomedical engineering that will be centered at Stanford: <http://bmesource.org>.

This program truly fulfills its name. It is, without a doubt, genuinely innovative as well as exciting, and it is an excellent role model for interdisciplinary and translational research. I certainly commend the Program Directors, faculty and staff for creating this exciting new model.

University Programs on Work-Family Balance

I received a number of comments from Newsletter readers in response to the article in the last Dean's Newsletter about women in science (<http://deansnewsletter.stanford.edu/#6>). Thanks to those who took the time to write – I always appreciate comments or suggestions related to topics presented in the Dean's Newsletter or other issues that you feel you would like to raise with me.

I appreciated in particular the note I received from Professor Patricia Jones, Vice Provost for Faculty Development. She informed me about two new brochures that have

just been published by the Office of the Provost that are directly pertinent to my comments. Entitled *Family Matters @ Stanford: For Faculty* and *Building on Excellence*, they describe the programs and resources at Stanford in the areas of family and work/life balance and in the recruitment of a diverse faculty. I was able to see advance copies of these brochures and can report that they are excellent. Copies are being mailed to all faculty and all school and department administrators within the next week or two. Stanford is doing a lot in these areas, and, importantly, has on-going plans to do more. In addition, the University's plans dovetail well with the programs that are getting underway in the School under the direction of Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership. I will share information about these initiatives later this fall.

Next Step is the LCME Visit

At the time of the next edition of the Dean's Newsletter we will be in the midst of the Site Visit by the LCME. As I have discussed in previous communications, this visit is very important, and we are working hard to prepare for the team that will come to Stanford on October 16-19th. This past week we had a consultant team visit with us to review the state of our preparations and provide final advice for our formal presentations. Assuming that our plans and proposals for the proposed Learning and Knowledge Center meet the expectations of the LCME, we heard from our consultants that they were quite impressed with the progress the School has made during the past four years. They highlighted in particular the engagement and commitment of the Dean to education and to the vision for the future of the School and Medical Center. They felt that our focus on translating discoveries is a correct one for Stanford. They were particularly impressed by the conceptual framework for the Stanford Institutes of Medicine and the role they will play in integrating basic and clinical science and clinical programs. The consultants also felt that the School's new operating budget and its focus on education are significant strengths. The consultant team also felt that the financial performance of the School and affiliated hospitals is a significant strength and that the clinical resources available for education are an additional strength. They were very impressed by the plans for the Knowledge Center as the future of the library and were of the view that our plans signal a true leadership role for Stanford. Not unexpectedly, the consultants highlighted the research productivity of the faculty as a true and unique strength. They were also impressed by the diversity of our student body and by the financial support that the School offers to students.

At the same time the consultants noted areas that need additional attention or that are transitional as the School's plans evolve. Among these is the Advising Program, which while stronger than it has been in the past, still requires attention. We certainly agree, and we are committed to continued improvement in this area. Additional transitional issues are, of course, the curriculum, including the Scholarly Concentrations, and the important issue of faculty diversity – each of which we are committed to address.

Dr. Oscar Salvatierra, Professor of Surgery and of Pediatrics, Emeritus, and Ms. Rebecca Trumbull, Office of Institutional Planning, who have been leading our preparation efforts, will be communicating with those who will be participating in the

visit later this week. They will be providing additional information for the visit, and I urge all participants to review this information carefully.

I want to thank the numerous faculty, students and staff who met with the consultant team and who will also participate in the actual Site Visit two weeks from now. Clearly one of the most important issues for us is to assure the LCME that we have a credible plan for advancing the Learning and Knowledge Center. Thanks to the efforts of many and the support of our School's leadership, I believe we will be able to convey our assurance that the next phase in the design and construction of this exciting facility will take place. The Learning and Knowledge Center will be the new front door to the School of Medicine. It will open new vistas for traditional and immersive learning and will be a state of the art "knowledge management center" that epitomizes the library and school of the future I look forward to sharing these plans with the LCME Site Visitors later this month and with you in the coming months as the planning move forward.

New NIH Research Opportunity in Translational Research

Dr. Harry Greenberg, Senior Associate Dean for Research, Graduate Education, and Postdoctoral Affairs, brought to my attention a program currently being offered by the NIH that has the potential to advance individuals' translational research efforts.

Specifically, this program, the NIH RAID Pilot Program, has the potential to provide critical GMP produced small molecules for further translational studies in the clinic.

It is modeled after the NCI RAID (Rapid Access to Interventional Development) program, which provides contract preclinical services. The NIH RAID Pilot is set up for any therapeutic area except cancer (still covered by NCI RAID), and covers only small molecules and oligos, not biologicals. The links for basic information are:

<http://nihroadmap.nih.gov/raid/>

<http://grants2.nih.gov/grants/guide/notice-files/NOT-RM-05-004.html>

In addition to the information provided on the web site, interested scientists should note that:

- Researchers can request a preclinical development plan (paid for by NIH, written by SRI) as a first step to guide them toward the steps to request in a full submission, and
- Partial or complete submissions can be made at any time, not just when the grant cycles occur.

New Mandatory Training in Human Embryonic Stem Cell Research

Stanford faculty recently received information from Dr. Arthur Bienenstock, Vice Provost and Dean of Research and Graduate Policy, about the new mandatory training tutorial in human embryonic stem cell research procedures. A portion of Dr. Bienenstock's letter is reprinted below for your information. Dr. Bienenstock writes:

As we increase our efforts in the critically important area of human embryonic stem cell (hESC) research, we must all work to ensure that our research meets all the applicable laws, regulations and standards. To ensure that everyone at Stanford understands these requirements, we have released policy and procedures and training to address the conduct of hESC work.

Stanford's Research Policy Handbook 10.7, Human Embryonic Stem Cell Research, covers the conduct of human embryonic stem cell research, requirements for identifying and tracking such research, compliance and reporting requirements, and the establishment of special operating procedures.

Because of the complexity of requirements and restrictions surrounding hESC research, all University personnel, including faculty, staff, postdoctoral scholars, and students, as well as visiting scholars and other researchers, must complete the "Human Embryonic Stem Cell Research Procedures Tutorial and Post Test" before beginning hESC research. Please note, this tutorial supplements, but does not replace, the already required "Use of Human Subjects Research Tutorial."

The hESC policy, procedures, and tutorial as well as supporting information can be found at the following website: <http://ora.stanford.edu/hesc/>

Dr. Bienenstock notes that in lieu of completing the on-line tutorial and test you may attend a faculty forum on October 5, 12:00-1:00 p. (lunch provided) on the procedures and administrative requirements of Human Embryonic Stem Cell Research. The forum will be presented by representatives from the Institutional Review Board, Office of General Counsel, Office of Research Administration, the Industrial Contracts Office, and the Research Management Group. Registration for the session is required at the following website: <http://reggie.stanford.edu/Signup.asp?1175>. I encourage anyone involved in human embryonic stem cell research to attend this forum.

GUP Traffic Survey Results

Thanks to those of you who completed the School of Medicine traffic survey last month. Julia Tussing, Managing Director of Finance and Administration, reports that we were able to deliver the necessary information to the Provost and give several suggestions about priorities for improving opportunities for using alternate means or timing for commuting to reduce trips. Among our high-priority suggestions were the following:

- Investigate the feasibility of an automated pay-for-parking system in which both the time and frequency with which commuters park in University lots is recorded, and the charges encourage less frequent use of parking and entering the lots outside of peak hours. Many survey respondents were willing to change their commuting habits but found an all-or-nothing change to difficult to manage. For instance, biking may be a feasible alternative except for rainy days; once a sticker

is purchased, however, the incentive is to use it rather than make the additional effort to bike.

- Work to remove the cultural/supervisor bias against working from home (for exempt employees) and flexible work hours. Many, many employees would be willing to change work hours or work from home, but were concerned that ours is not a positive culture for these alternatives.
- Improve storage facilities, routes and changing facilities for bicyclists. Many more people would be willing to bike to work if they could feel their bicycle was safely stored and if they had a way to clean up after arriving at work.
- Supply the Caltrain "GO Pass" free to postdoctoral scholars. Based on suggestions given by postdoctoral scholars in this survey, access to a free or discounted GO Pass may help reduce GUP trips.

Here is a short summary of the survey results:

- 45% of staff and 37% of faculty responded
- Currently weekly GUP trips are 16,060 of a possible 49,160 (32.7% of the total possible GUP trips)
- Faculty and staff reported that, using the ideas in Parking and Transportation's handout and website (<http://transportation.stanford.edu/index.shtml>), they could reduce their trips by 26%

675 of the 2000 survey participants gave over 1,000 great suggestions for reducing trips. The winners of the \$100 reward for the most creative, feasible new suggestions were:

- Pete Jakovich, Director for Finance & Administration, Molecular and Cellular Physiology and Comparative Medicine
- Alisha Eisert, Animal Health Technician for Comparative Medicine
- Linda Cork, Professor and Chair, Comparative Medicine
- Joshua Callman, Director, Office of Continuing Medical Education, Office of Student Affairs
- David Paik, Postdoctoral Scholar, Radiology
- Peter Burnes, Health & Safety Specialist
- Kristy Verhines, Administrative Associate, Neurology

Please implement your own trip reduction ideas this month. A reduction in GUP trips this fall is critical to the maintenance of the University's agreement with the county, and if we want to avoid involuntary limits on our commuting we must remain within the guidelines that have been set. Many thanks for your involvement and support in this endeavor.

Respectful Workplace Initiatives

Over the last three years faculty and staff have been participating in the School of Medicine's Respectful Workplace Briefings. The Briefings underscore the importance of maintaining a respectful workplace that fosters professionalism and values the integrity

and respect for all of us at the School of Medicine. The Briefings have provided an opportunity to discuss what makes a respectful workplace, how to handle difficult disrespectful situations, and to present resources available to faculty and staff for assistance in addressing concerns that may arise. The Respectful Workplace Briefings for faculty, clinician/educators, and staff will continue on a quarterly basis.

As we continue to develop a respectful workplace, other initiatives will be implemented. Among those initiatives is a Workshop Series--any faculty, clinician/educator, or staff member may attend. The series is sponsored by the Offices of Human Resources, Ombuds and Academic Affairs and will be presented from noon to 1:00 p.m. at MSOB, X303 on the first Thursday of each month beginning on October 6, 2005 and continuing to March 2, 2006. The workshop topics are as follows:

- | | |
|---------|---|
| 10/6/05 | Straight Talking -- a video featuring John Cleese, discussion following the video--facilitated by Martha McKee, SOM Ombudsperson and Norma Leavitt, Associate Director, Employee Relations SOM Human Resource Group |
| 11/3/05 | The Power of Listening--facilitated by Martha McKee |
| 12/1/05 | Communication Skills--facilitated by Rosan Gomperts, Director of Stanford HELP Center |
| 1/5/ 06 | Diversity in the Workplace--facilitated by Hannah Valentine, Profession of Medicine and Senior Associate Dean for Diversity and Leadership |
| 2/02/06 | Psychological Issues in the Workplace--facilitated by David Rasch, University Ombudsperson |
| 3/02/06 | Meetings, Bloody Meetings-a video featuring John Cleese, discussion following video on effective meetings management--facilitated by Martha McKee and Cori Bossenberry, Director SOM Human Resource Group |

Announcements and further description of each workshop will be distributed to departments prior to the workshop date, along with instructions for registration.

Other initiatives supporting the Respectful Workplace include Supervisory Essentials, a seven-week course that provides tools to assist supervisors in creating and maintaining a respectful workplace and includes discussion on the expectations of supervisors. Additionally, staff from HRG, the Campus Office of Training and Organizational Development and the Department of Medicine are developing a two-part workshop on Conflict Resolution - which will be announced in early 2006.

If you have any questions on any of these initiatives or presentations, please contact the Human Resource Group at 5-8607. I strongly encourage you to attend these

presentations and to continue modeling respect and compassion in our dynamic and diverse workplace.

Events

A number of exciting and important events transpired during the past week, among which were:

- ***The 7th Annual Thomas J Fogarty, MD Lecture: Focus on Innovation*** – featured a thoughtful and informative presentation by Dr. Bill Brody, President of Johns Hopkins University – and an MD/PhD graduate of Stanford.
- ***Stanford Synapses: A Meeting of the Minds*** featured a symposium sponsored by the Stanford University Medical Alumni Association and led by the Neuroscience Institute at Stanford. Professors Bill Mobley, Robert Sapolsky, Susan McConnell, Nobuko Uchida and Rob Malenka gave excellent presentations. This was a far-reaching event that encompassed the interplay between stress and brain damage, developmental neurobiology, neural stem cells and brain plasticity. The symposium was followed by a dinner presentation by Dr. Tina Seelig on the interesting topic of “The Mind Metaphor: Building Businesses that Behave like the Brain.”
- ***Dr Harvey Cohen***, the Arline and Peter Harman Professor and Chair of Pediatrics was honored at an event naming him the first incumbent of the Adalyn Jay Chief of Staff at the Lucile Packard Children’s Hospital. Congratulations to Dr. Cohen.
- ***The California Institute for Regenerative Medicine*** hosted its first scientific meeting entitled Stem Cell Research: Charting New Directions for California. The Symposium was held in San Francisco on October 1-2nd, A webcast of this meeting is available at <http://www.cirm.ca.gov/>.

Awards and Honors

- ***Three More Pioneers***: This has been an exciting week for three members of our Stanford faculty and, thanks to their accomplishments, for the School of Medicine and Stanford University. When the NIH announced the 13 winners of the highly prestigious Pioneer Award, three of them came to Stanford. Given the competition for this award, a medical school would be proud to have even a single award. Having three of the 13 awards come to Stanford is extraordinary – but I would argue quite appropriate given the outstanding faculty we are so fortunate to have in our community. (See also <http://mednews.stanford.edu/releases/2005/september/pioneer-award.htm>).
Special congratulations to our three new NIH Pioneer Awardees
 - ***Karl Deisseroth, MD, PhD***, Assistant Professor of Bioengineering and Psychiatry
 - ***Pehr Harbury, PhD***, Associate Professor of Biochemistry
 - ***Tom Rando, MD, PhD***, Associate Professor of Neurology and Neurological Sciences

- **One More MacArthur Awardee:** In addition to being named a recipient of the NIH Pioneer Award, **Dr. Pehr Harbury** was also named a recipient of a MacArthur (genius) Fellowship this past week. Obviously incredibly wonderful news. Biochemistry now has two MacArthur Fellows since Dr. Julie Theriot was named a recipient of this extraordinarily prestigious award last year.

Upcoming Events

Stanford School of Medicine Fall Forum on Community Health and Public Service

Tuesday, October 4, 2005
5:00 - 7:30 pm
Frances C. Arrillaga Alumni Center
326 Galvez Street, Stanford University*

Keynote Address: Dr. Sheri Fink

Author of *War Hospital: A True Story of Surgery and Survival*
http://med.stanford.edu/community/models-mentors/sheri_fink.html

The 4th Annual Fall Forum will feature a wide range of service and partnership research projects undertaken by Stanford students in underserved communities here and around the world.

This event is free of charge and open to the public.

If you will be attending, RSVP to fallforum2005@yahoo.com to assist us in our planning.

Organized by Stanford Medical Students with the support of the School of Medicine's programs in Community Health and Public Service. For more information, see <http://med.stanford.edu/community/>.

*Directions: <http://www.stanfordalumni.org/aboutsaa/saamap.html>

15th Annual Jonathan J. King Lecture

Doctors as Storytellers

Neal Baer, MD

Wednesday, October 26, 2005 at 5:00 pm

Fairchild Auditorium

Dr. Neal Baer is Executive Producer of the NBC television series *Law & Order: Special Victims Unit*. Prior to his work on *SVU*, Dr. Baer was Executive Producer of the NBC series *ER*, for which he was nominated for five Emmys. Dr. Baer graduated from Harvard Medical School and trained in Pediatrics at Children's Hospital, Los Angeles. He has received honors from the American Medical Association, the American

Association for the Advancement of Science and Physicians for Social Responsibility for his contributions to public understanding of medicine via the media.

For more information, please call the Center for Biomedical Ethics at 650-723-5760 or visit <http://scbe.stanford.edu/events/king.html>

Dean's Newsletter

October 17, 2005

Board of Trustees Approves Concept and Site for the Learning and Knowledge Center

On Monday, October 10th the Land & Buildings Committee of the Stanford University Board of Trustees voted unanimously to recommend "Concept and Site" approval for the School of Medicine's Learning and Knowledge Center (the LKC). This recommendation was approved by the full Board of Trustees on Tuesday, October 11th. While a number of important milestones lie ahead, this approval was a very important step for the LKC project, in part because it allows for the creation of a timetable for its completion. Indeed, if the project moves forward according to the current plan, we will now carry out a competition for architectural selection with the goal of initiating the design phase in early in 2006. Construction would begin in the fall of 2007, and the LKC would be completed in the summer of 2009. This date would be significant, since 2009 represents the 50-year anniversary of the move of the School of Medicine to the Stanford campus from San Francisco in 1959!

As many of you know, planning for the LKC has been going on for some time. We formally initiated planning in the summer of 2002 in tandem with our efforts to substantially revise the curriculum for both medical and graduate education. While there had been previous plans to renovate the School's education and library facilities that predated my arrival in April 2001 (the so-called GALE Project), I recommended that this plan be scrapped since it had not been carefully aligned to the education and learning programs that would define our future. The development of the New Stanford Curriculum under the leadership of Senior Associate Dean Julie Parsonnet in partnership with the Medical School Faculty Senate, as well as our efforts to further enhance graduate student education and postgraduate training, allowed us to better define the requirements for a new education facility. Similarly, the plans for a future library have undergone fundamental change with the rapidly expanding digitization of printed journals and texts. Ms Debbie Ketchel, Associate Dean for Knowledge Management and Director of the Lane Medical Library and Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, have provided the leadership in the evolution our plans for a Knowledge Management Center.

Based on these new program definitions, the Learning & Knowledge Center will be housed in one new building and two renovated ones (portions of Lane and Alway). Collectively, these buildings will transform our education and learning programs. Equally importantly, the new LKC, which will be located on the site of the Fairchild Auditorium, will serve as the new front door of the School of Medicine. It will provide a vital connection to the University campus, particularly to the Science and Engineering Quads, as well as to the major research buildings of the School, including its close proximity to the Clark Center. The LKC will also be a crucially important portal to Stanford Hospital & Clinics and the Lucile Packard Children's Hospital.

As currently configured, the new 120,000 gross square feet LKC will house a new and highly flexible Conference Center, the Learning Commons and Classrooms, the Knowledge Center and the Center for Immersive and Simulation Based Learning. It will consist of a basement level and three above ground floors and will, I hope, be the active hub and gathering site for our undergraduate and postgraduate students and trainees as well as faculty and community visitors. Additional information about each of these components follows:

- The new ***Conference Center*** will be housed on the basement level and will be designed to have external light exposure. It will include a ballroom style facility seating up to 350 people that will be divisible into three smaller rooms. There will also be a breakout rooms adjacent to the Conference Center.
- The ***Learning Commons and Classrooms*** will be housed on the first floor and will include small and larger classrooms designed in a highly flexible manner to accommodate a wide range of teaching formats, from lectures to case-based learning. Twenty-four hour accessible student study areas will be housed here as well as in the top floor. There will also be an Executive Board Room/Meeting Room on this floor.
- The new ***Knowledge Management Center*** will be housed on the second floor. This will be the new digital Lane Library, and it will serve as the hub of a highly distributed wireless knowledge center that will permeate the entire school. The Knowledge Management Center will also house a variety of student study facilities.
- The ***Center for Immersive and Simulation-Based Learning (CISL)*** will be located on the third floor. The Center will be guided by Dr. David Gaba, Associate Dean for Immersive and Simulation Based Learning. It will provide state-of-the-art learning using exciting new technology as well as serving as a testing ground for future developments. This Center will also be a hub and will connect to: the Center for Simulation at SHC, directed by Dr Tom Krummel, the Center for Advanced Pediatric Education (CAPE) at LPCH directed by Dr. Lou Halamek, and the Simulation Center at the Palo Alto VA directed by Dr. Gaba. Together with the Information Resources and Technology office (IRT) and the Stanford University Medical Media and Information Technologies (SUMMIT),

these programs are forging a strong environment for both general medical education and specific training, with applications across the age and disease/discipline spectrum.

The CISL is being designed to provide a hands-on learning environment for clinical, procedural and interpersonal skill development using simulation learning (including mannequin simulators, virtual and haptic models) as well as standardized patients (e.g., live actors). Further, the learning environments will replicate everything from outpatient clinic rooms, inpatient rooms, ICU, operating rooms, etc. These varied settings and modalities will permit scaled learning opportunities for undergraduate medical students as well as graduate students and postdoctoral trainees. The CISL will also be attractive for continuing medical education and for courses for undergraduates as well as members of the community.

To fully develop the Learning and Knowledge Center environment, the project will include, in addition to the new facility, renovations of portions of the Lane and Alway buildings. It is likely that these renovations will undergo further revision as we move to the next phase of the project. At this time, however, we envision that the Lane project could be designed to house 25% of the current Lane Library collections that are not stored off-site, although this plan may change if more of the collections are moved off-site. In addition, the Lane renovation plans currently include study and gathering areas for students, on-call rooms for medical students, bioscience graduate student services and the Dean's administrative offices.

Current plans for renovations in the Alway building include student services, lounge and meeting rooms and an expanded café. A virtual reality facility complementing CISL will be housed on the first floor and will focus on education, research and patient care simulations. In addition, the recently renovated Fleishman labs will undergo a modest expansion.

Taken together, the new LKC construction along with the renovations in the Lane and Alway buildings should define one of the most exciting and important education and knowledge centers in the country – and it will be commensurate with the status of Stanford as a leading research-intensive school of medicine.

To bring this vision to fruition and to integrate the LKC project with the 10-20 year master facility plan for the School of Medicine, a “connective elements project” will accompany the new construction and renovations. It will include an integrated plan for above and below ground communications and transportation programs, as well as the necessary linkages that will draw the medical campus together – and ultimately better align it to both the University and the hospitals. This will be especially important as new research facilities (e.g., the Stanford Institutes of Medicine) also come on line in the next couple of years.

Needless to say, a project of this size and scope is expensive – not only for the construction and renovations but also for the infrastructure supports (i.e., “connective elements”), technology and various fees for building on the Stanford campus. Although the cost will change (and only downward will be tolerated) it is currently projected that this will be a \$156M project (\$86M for new construction, \$42.4M for the Lane/Alway renovations, and \$27.6M for the “connective elements”). We are working on the funding plan for the project and recognize that multiple sources will be needed, including school resources, philanthropy and debt financing. Because this is a project that affects every member of our medical school community, it is also my hope and expectation that everyone will feel and take ownership of the LKC and think about how they can help. Clearly the realization of this project will help define the School of Medicine both for individuals and collectively.

This project will be transformative to the School of Medicine and will serve as a fitting way to celebrate the 50th anniversary since our move from San Francisco to the Stanford campus. There is no doubt that the 1959 move helped propel Stanford into the front league of American medical schools and fostered an amazing environment of interaction between the Schools of Medicine, Engineering, and Humanities & Sciences, among others. I truly believe that the LKC project will further enhance this bond and make our alignments even stronger and more compelling.

The LCME Visit is Live – and Hopefully Well

As you read this, the site visit team from the Liaison Committee on Medical Education (LCME) is in the midst of conducting a comprehensive review of the School of Medicine with the goal of determining our accreditation status. In general LCME reviews occur every 8 years (assuming all has gone well) and include both a detailed self-study period and then an actual on-site visit. As I have written in prior Dean’s Newsletters (see http://deansnewsletter.stanford.edu/archive/07_25_05.html#5, http://deansnewsletter.stanford.edu/archive/09_20_04.html#3), the preparations for this visit have been extensive and have involved hundreds of faculty, students and staff and thousand’s of pages of detailed program description and analyses. The site visit team will make their recommendations to the LCME, which is governed equally by the Association of American Medical Colleges (AAMC) and the American Medical Association (AMA).

The agenda for the site visit is, for the most part, proscribed by the LCME and is quite comprehensive. It began with a meeting with me on Sunday evening, October 16th to review the visions, plans, accomplishments and challenges of the School of Medicine.

On Monday, October 17th, the team reviewed the education program for the MD degree, focusing the current and evolving education programs as well as their implementation, management and evaluation. This was followed by a review of the library and information services, focusing on our knowledge management center and its integration into the planned Learning and Knowledge Center (LKC). The team then toured some of the existing facilities (Lane Library, computer learning facilities, lecture halls, small classrooms, labs and study areas) prior to a lunch meeting with a self-selected group of

pre-clerkship students. Next the site visit team met with the program directors for the required preclinical courses and the required clinical clerkships.

On Tuesday the site visit team will meet with faculty and deans regarding the academic advising and learning environments. In addition they will address electives and fourth year courses, as well as our special and unique programs for joint degree training and our novel approaches to education. They will also meet with the Admissions and Financial Aid Office to review their programs and will evaluate our counseling and health services for students. The team will also meet with self-selected clinical students and tour the Anatomy Teaching Suite, SUMMIT – Collaboration and Skills Room and the Radiology Learning Center – Lucas Center.

A review of medical center finances will be conducted along with an assessment of the School's resources for clinical education. These reviews will be followed by meetings first with the basic science chairs and then with those clinical science chairs who have oversight over required student clerkships.

On Wednesday, October 19th the site visit team will begin their day by meeting with a group of junior faculty and then with senior deans and school and hospital leaders to review institutional faculty issues. These meetings will be followed by a review of the graduate programs and our basic science research programs.

Clearly this will be a very comprehensive visit – touching on virtually every aspect of the School's missions in education and research. After the team has reviewed and reflected on their findings and analyses, I will meet with them in an exit interview on Wednesday, October 19th. I will of course keep you informed about the outcome of this important visit.

Facilitating Clinical and Translational Research: *The Stanford/Packard Center for Translational Research in Medicine*

At the October 7th meeting of the School's Executive Committee, Dr. Steven Alexander, Professor of Pediatrics, and his colleagues on the planning group for the Stanford/Packard Center for Translational Research in Medicine (SPCTRM) announced that, after more than two years of preparation, SPCTRM will launch its clinical research services on November 1. Unfortunately I was unable to attend that meeting and this report was prepared by Dr. Alexander and members of the SPCTRM team [thanks, but I really did no writing on this one, except for the last paragraph!]. According to them, the services that SPCTRM will provide include:

- 1) **Biostatistics Consultation Services:** SPCTRM's first consulting biostatistician, Alex McMillan, PhD, joins the team on November 1, where he will be available by appointment for one-hour consultations. Details of the services Dr. McMillan will offer can be obtained by calling SPCTRM Program Manager, Linda Walker at 498-7425. After October

24, Linda can also assist investigators in obtaining appointments with Alex.

- 2) **Informatics Consultation Services:** In conjunction with the Center for Clinical Informatics, SPCTRM will also arrange consultations for investigators with a team of informatics and data management specialists who will assist in the design of HIPAA-compliant data management strategies. Biostatistics and informatics consultations will be coordinated to optimize study design at the earliest stages of development.
- 3) **A New Approach to Study Budgets:** All sponsored projects involving human subjects will now be budgeted by Research Process Managers at RMG using new methodology that relies heavily on input from PIs and Study Coordinators at the initial budget meeting with the RPM. Training for Study Coordinators in the use of the newly designed process has begun and will continue as an ongoing educational series (see below)
- 4) **Improved Hospital Discount Structure:** SPCTRM, LPCH and SHC have developed a new research discount structure for hospital services and supplies that is intended to be more competitive. Hospital discounts will be applied on a go-forward basis, by your RPM, to studies budgeted after November 1.
- 5) **Automated Billing:** A unique automated study billing process will allocate study charges according to the study's budget, providing frequent reports on study activity to coordinators and PI's.
- 6) **Improved Contracting and Accounts Receivable:** The Office of Sponsored Research has been working closely with SPCTRM to improve the contracting and accounts receivable process. New OSR staff have been designated Clinical Research Contracting Specialists and a fully automated clinical study account management system is on the horizon.
- 7) **Regular Compliance Reviews:** SPCTRM will begin educational compliance reviews of individual studies to assist investigators in maintaining the high standards now demanded of all clinical research.
- 8) **SPCTRM SuperUsers Workshops:** Coordinators are invited to become SPCTRM SuperUsers by attending a series of workshops devoted to the new SPCTRM processes. Please contact Linda Walker at 498-7425 for details and to reserve a seat in an upcoming workshop.
- 9) **Continued SPCTRM Clinic and Coordinator Services:** SPCTRM will continue to offer free outpatient clinic space for clinical research, and will maintain the full menu of coordinator services previously provided by ACCESS including orientation, education, training, health screening and competency testing.

Dr. Alexander noted that the SPCTRM Core Team is available to answer your questions. The team consists of:

- Steve Alexander, MD, Medical Director sralex@stanford.edu, pager # 13674
- Nick Gaich, Chief Operating Officer: ngaich@stanford.edu
- Connie Hartnett, Co-director, RMG: Hartnett@stanford.edu
- Anna Hu, RN, Director of Coordinator Services: 498-7425

- Linda Walker, Program Manager: 498-7425

I want to thank all the members of the SPCTRM planning group for their extensive efforts in establishing these services: Steven Alexander, Sara Bible, Nick Gaich, David Haray, Connie Hartnett, Ann James, Steve Jung, Carole Klove, Phil Lavori, Henry Lowe, Gary May, and Pamela Webb. The launch of SPCTRM is a major accomplishment, and I am confident that its activities will allow us to make major strides in our capacity to translate discoveries and bring new therapies to our patients.

New Office for Community Health

On Tuesday, October 4th, our medical students hosted the Fourth Fall Forum to feature their highly diversified contributions to community service and research. Special thanks go to Anna Minta, SMS II, and Lynn Rosen, SMS II, who served as the 2005 Fall Forum Coordinators – and who did a superb job. The Forum consisted of poster presentations as well as selected oral presentations. The offerings were highly diversified and ranged from topics impacting local communities and patients to international efforts and research projects. I am extremely pleased by the wealth of excellent qualitative and quantitative research conducted by our students. Some carried out their projects as part of their participation in the Scholarly Concentration on Community Health and Public Service, whereas, for others, the research shown at the Fall Forum complemented their efforts in different areas of science and medicine.

I was also pleased to announce at the Fall Forum that the School is initiating a new Office of Community Health under the direction of Dr. Marilyn Winkelby, Associate Professor of Medicine. Stanford has a long tradition of commitment and excellence in community service locally, nationally and internationally. Until now there has been no central home or umbrella to organize or orchestrate these efforts. It is my hope, and that under the leadership of Senior Associate Dean Julie Parsonnet and Ann Banchoff, Associate Director of PriSMS, that the new Office of Community Health will serve this important integrating function. Among the important functions that will align with the Center for Community Health are the Arbor and Pacific Care Free Clinics, the Center of Education in Family and Community Medicine, the Office of Diversity, the Center of Excellence, the Haas Center for Public Service and our new Scholarly Concentration in Community Health and Public Service. International initiatives will also be embraced by the Center as they develop.

Enhancing Diversity and the Center of Excellence

The Stanford University Center of Excellence (COE), which is led by Drs. Ron Garcia and Fernando Mendoza, has a long and distinguished role in supporting medical students to be effective with an ever-increasing diverse population. The COE offers a panoply of education and research opportunities that have had an enduring impact on students and faculty. They have played an important role in enhancing the diversity of our medical student class and improving the pipeline of students who apply to medical school from diverse backgrounds. They have also nurtured and supported students and helped promote and enhance their career development (see <http://coe.stanford.edu/> for details)

One of the ways that diversity is enhanced at Stanford Medical School is through the work and leadership of our students and the various organizations they represent. At the COE Fall Social on Tuesday, October 11th student leaders from various organizations reported on their specific activities and goals for the year. By doing so they weaved a remarkable web of programs that are individually unique as well as diverse – and that make the whole clearly greater than the sum of its parts.

There is much to be proud of at Stanford – including the commitment of our students, faculty and staff to respecting and enhancing diversity. I am extremely proud and appreciative for their efforts. We surely have much more to do but there is no doubt that over the years significant progress has been made – and that there is a commitment to achieving further excellence in diversity.

Drug Marketing and Television Ads

I must confess that I don't watch much television so I am likely late in taking note of what is a worrisome trend. Sure, I had seen advertisements regarding drugs to help men with erectile dysfunction – but the nearly exclusive showing of those ads during sports events says a lot about marketing – and marketing abuse. But I was quite chagrined the other night when an ad popped up on a TV show (I think it was during a news hour) that was promoting the use of colony stimulating factor for patients about to undergo cancer chemotherapy. As a pediatric oncologist I am well aware of the significant toxicities that accompany chemotherapy, including neutropenia (a low white blood cell count) and the consequent heightened risk for infections. Indeed, during one phase of my own career I spent considerable time and effort defining approaches to address these complications, based on laboratory and clinical research studies. One of the advances in the armamentarium for neutropenia is the use of recombinant hematopoietic colony stimulating factors (G-CSF). In a number of settings the use of G-CSF can shorten the duration of neutropenia and reduce or attenuate infectious complications. Because these agents are expensive and have side effects and limitations, the American Society of Clinical Oncology (ASCO) and other societies have come forth with guidelines to help better define their use. I have worked on the previous guideline committees for ASCO and, interestingly, have been in the midst of working with the committee to revise these guidelines based on data that has become available during the past several years. We hope that these new guidelines will be published in the 2006.

Within that context I must admit that I was quite distressed to see the ad related to one of these G-CSFs since it truly misrepresented its appropriate use. It implied, misleadingly, to patients who are being diagnosed with cancer that the use of this specific G-CSF would definitely improve their lives – reduce complications, make it more possible to receive chemotherapy on time, etc. Not surprisingly, the ad played to the emotions of cancer patients. While I can support attempts to empower individuals facing the challenge of serious life-threatening disease, it is sad to see this being done for what are clearly financial motivations on the part of the drug company.

In past issues of the Dean's Newsletter I have expressed my concerns regarding the ways in which medicine is violating the public trust. I think ads like this one are yet another example. And while I recognize that I have a limited sample of experience, I doubt that what I am describing is unique or unusual. Sadly.

Honors and Awards

- **Dr. Ira Glick**, Professor of Psychiatry and Behavioral Sciences, has been recognized as a leading physician in conjunction with the 2005 Mental Illness Awareness Week Thank You Campaign sponsored by the National Alliance for Mentally Ill (NAMI). Congratulations to Dr. Glick.
- **Dr. Jeffrey Gould**, Robert L. Hess Professor in Pediatrics, was installed as the first incumbent of the Robert L. Hess Endowed Professorship in Pediatrics at a celebratory event on Tuesday, October 11th. Dr Gould is the director of the Perinatal Epidemiology and Health Outcomes Research Unit in the Division of Neonatology. He also directs the California Perinatal Quality Care Collaborative, a network of more than 100 California hospitals that provide intensive care to newborns and share outcome data and service improvement initiatives. He is internationally recognized for his important work and has been a member of the Stanford faculty since 2003. Congratulations to Dr. Gould.
- **Dr. Ralph Greco**, Johnson and Johnson Professor of Surgery, has been selected as one of the ten outstanding program directors in the nation to receive the Parker J. Palmer "Courage to Teach" award. Dr. Greco, who has been Director of Stanford's General Surgery Residency Program since 2000, will be recognized at a special awards dinner hosted by the Accreditation Council of Graduate Medical Education. Congratulations Dr. Greco.
- **Dr. Allan Reiss**, Howard C. Robbins Professor of Psychiatry and Behavioral Sciences and Director of Child and Adolescent Psychiatry, will be receiving two notable awards this month. First is the George Tarjan Award, given in recognition of the child and adolescent psychiatrist and AACAP member who has made significant contributions in a lifetime career or single seminal work to understanding or caring for those with mental retardation and developmental disabilities. In addition, Dr. Reiss will be honored by the National Alliance for Research on Schizophrenia and Depression (NARSAD) with their Ruane Prize. This award recognizes scientists who give particular promise for advancing our understanding of psychotic, affective or other severe psychiatric disorders having their onset in childhood or adolescence. Congratulations to Dr. Reiss.

Events

- *"Opportunity of a Lifetime,"* a documentary that follows high school students involved in the Stanford Medical Youth Science Program (SMYSP), debuts on KQED-TV October 23rd at 5 p.m. The 30-minute film focuses on the ethnically diverse group of teenagers who take part in SMYSP, a five-week summer residential program on our campus that provides hands-on training in science and medicine. Participants are from very low-income backgrounds, and many credit SMYSP with giving them the confidence and skills to apply to college and seek out scientific and health-related careers. Each year, 24 students from northern and central California are selected for the summer program, which was established in 1988 by Marilyn Winkleby, Ph.D., and Associate Professor of Medicine. For more information about the program: <http://smysp.stanford.edu>
- "Sensation to Action," the 2005 Beckman Symposium, will be held on Wednesday, October 26, 8:00 am – 6:00 p.m. at the Clark Center Auditorium. Among the speakers are two Nobel Laureates -- Linda Buck, whose studies focus on the processing of olfactory signals by higher centers, and Eric Kandel, whose pioneer work in signal transduction in the nervous system provided the foundation for understanding how changes of synaptic function are central for learning and memory.
- "Doctors As Storytellers," the 15th Annual Jonathan J. King Lectureship, will be held on Wednesday, October 26, 2005 at 5:00 pm in the Fairchild Auditorium. The guest speaker will be Dr. Neal Baer, Executive Producer of the NBC television series *Law & Order: Special Victims Unit*. Prior to his work on *SVU*, Dr. Baer was Executive Producer of the NBC series *ER*, for which he was nominated for five Emmys. Dr. Baer graduated from Harvard Medical School and completed his internship in Pediatrics at Children's Hospital, Los Angeles. He received the Jerry L. Pettis Memorial Scholarship from the American Medical Association as the most outstanding medical student who has contributed to promoting a better understanding of medicine in the media. The American Association for the Advancement of Science selected Dr. Baer as a Mass Media Fellow. In 2003, he was honored by Physicians for Social Responsibility for "accomplishment in crafting compelling health messages." This event is free and open to the public. For more information, please call the Center for Biomedical Ethics at 650-723-5760.

Appointments and Promotions

- **Roland Bammer** has been appointed to Assistant Professor (Research) of Radiology, effective 10/01/05.
- **Katrin Chua** has been appointed to Assistant Professor of Medicine (Endocrinology, Gerontology and Metabolism), effective 10/01/05.
- **Peter Fitzgerald** has been appointed to Professor (Research) of Medicine, effective 10/01/05.

- ***Jin Hahn*** has been promoted a continuing term of Professor of Neurology and Neurological Sciences and of Pediatrics, effective 10/01/05.
- ***Brian Hargreaves*** has been appointed to Assistant Professor (Research) of Radiology, effective 10/01/05.
- ***Nihar Nayak*** has been appointed to Assistant Professor of Obstetrics, effective 10/01/05.
- ***Tracey McLaughlin*** has been appointed to Assistant Professor of Medicine (Endocrinology), effective 10/01/05.
- ***Donald Olson*** has been promoted to Associate Professor of Neurology and Neurological Sciences, effective 10/01/05.
- ***Anna Penn*** has been appointed to Assistant Professor of Pediatrics, effective 10/01/05.
- ***Stephen Skirboll*** has been reappointed to Assistant Professor of Neurosurgery, effective 10/01/05.
- ***Margo Thienemann*** has been reappointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 10/01/05.

Dean's Newsletter

October 31, 2005

Update on the LCME Accreditation Process

The last issue of the Dean's Newsletter came out in the midst of our site visit by the Liaison Committee on Medical Education (LCME), which, as I indicated then, was a very extensive review of virtually all of our programs and missions (www.lcme.org). I met with the site visit team for exit interviews, one of which included Provost John Etchemendy, and was informed of the process that now follows. At the exit interviews the site visit team read the executive summary of the report they will file. We will receive the complete report in about a month, when we will have the opportunity to correct any factual errors. The report, after review by two additional LCME readers, will go to the February meeting of the LCME, where the LCME will consider and vote on the report and its recommendations. We should receive the final product in late February or early March, when we will be able to make it public. Until then the contents of the report and the committee's recommendations must remain confidential.

While fully respecting the process I think it is fair for me to say that I was quite pleased with the comments of the reviewers and am sure you will be as well. Moreover, I believe I am able to convey one important point I heard in different settings with the site visit team that I think we can all be pleased with: namely, how impressed the site visit team was by the energy, excitement, collegiality and interactions they perceived among our faculty, students and staff – and how well expressed these were in our novel and important interdisciplinary efforts in education, research and patient care. For that I want to thank and compliment all of you, since I too think this is one of our greatest strengths. Indeed, continuing to create a highly interactive environment will offer us, in the future as it has in the past, unique opportunities to fulfill our vision and to be a true role model among the nation's leading academic medical centers.

I want to thank all who participated in the visit and who shared their viewpoints, perspective and passion with the site visit team. I want especially to express my appreciation to those who worked so diligently over the past year to prepare for the visit. While this also includes many individuals, I want to thank in particular Ms. Rebecca Trumbell, LCME Program Manager, Dr. Oscar Salvatierra, Faculty Leader, and Ms. Kendra Baldwin, Administrative Associate for the project. Their efforts, along with yours, made this visit highly successful – and for that we can all be appreciative.

STRIDE Takes a Step Forward

The following summary, from a presentation to the Executive Committee on October 21st, has been provided by Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology. I am pleased to share it with you.

In 2003 the Institute of Medicine issued a report on the challenges facing the national clinical research enterprise (see Sung NS et al. *JAMA*. 2003 Mar 12;289(10):1305-6.). This report identified a number of obstacles to effective translational research, including the lack of standards-based research information systems that can interface with the emerging electronic health record model. To address this "translational block" at Stanford, the School is developing a high performance research information system called STRIDE (Stanford Translational Research Integrated Database Environment). This project, based in the Stanford Center for Clinical Informatics, within the Office of Information Resources and Technology (IRT), is creating a HIPAA-compliant biomedical data repository based on emerging national informatics standards.

The overall goals of the STRIDE project are to provide a robust research data management platform to the SUMC community and to create a data warehouse of clinical and biomedical research data supporting SUMC's translational research mission. The first phase of the STRIDE project is nearing completion and the system is receiving clinical data from information systems at both SHC and LPCH. STRIDE currently supports a number of research projects at SUMC using its tissue banking, clinical trials, disease registry and outcomes data management functionality. Through its use of national informatics standards, STRIDE supports interoperability with clinical systems and with research systems both inside and outside of Stanford. A longer term goal of the STRIDE

project is to create a database of linkages between clinical and research data that will support both research cohort identification and computer-assisted knowledge discovery. More information on the STRIDE project is available at: <http://stride.stanford.edu>

Budget Reflections for 2005 and 2006: The Ups and Downs

The School's FY05 fiscal year officially closed on August 31, 2005, and we are assembling the final results for the year. We report our results as both a school-wide consolidated summary and by departments, institutes, administrative units (including the Dean's Office) and other school functions and entities. It is important to note that, while these reports are useful, they represent only a snapshot in time and are influenced by commitments that may have been made but not yet implemented.

It is also important to note that while we may feel financially challenged (and in fact we are), the School of Medicine does benefit from a significant endowment (market value is \$1.644 B as of August 31, 2005). However, the vast majority of the endowment is highly restricted to specific activities (such as student financial aid and specific areas of research) and cannot be used to fund new initiatives outside the scope of their designation. Approximately a quarter of the endowment dollars reside in departments but the range is quite wide (from \$14,000 to \$75,249,000), as is the variation in the size and complexity of the departments themselves. Except in unusual circumstances, endowments cannot be expended. These funds generate an annual payout of approximately 4.5%, which can be used to fund expenses that are in line with the endowments' designated purposes.

In addition to endowment resources, the School (as represented by the Dean's Office), departments and institutes have expendable reserves. At the close of FY05 these totaled \$367.4M, of which \$141.2M resided in the Dean's Office and \$226.2 in the departments/institutes. As with the endowments, there is a wide variance among departments in expendable reserve balances, ranging from \$114K to \$50.3M.

These funds have been accrued over the years by a combination of fiscal prudence and investments, gifts, royalty income, and clinical income. It is also important to note that the opportunities to accrue reserves or endowment by departments is highly variable, and, it should go without saying, every department would like to have a reserve balance - although only a handful truly do have such a balance. That said, these funds are extremely important to the health of the departments and, as a consequence, of the School, since they are used to support recruitments, program and capital investments, etc. Indeed, in many ways they are a resource that helps Stanford to achieve and maintain its stature as a leading research-intensive school of medicine.

As you know, during the past several years the School has been investing in its Strategic Plan, *Translating Discoveries*. We anticipate further investments during the years ahead - as well as increased incoming resources from new grants and support from foundations and individual philanthropy. But we are at somewhat of a crossroads. If new resources do not soon compensate for our investments we will need to scale back programs - which

would be most unfortunate. Until now, the School's consolidated financial performance has been positive (indeed there was a \$12M consolidated surplus in FY05). However, for FY06 we are now projecting a \$24M deficit (or use of reserves), exclusively from the Dean's office, primarily because of continuing support for interdisciplinary initiatives, education, information technology and capital investment projects. The latter include primarily the renovation of the Arastradero research building and early investments for the Learning and Knowledge Center and Stanford Institutes of Medicine #1.

The primary components of the \$48.1M of Dean's Office investments are:

- Capital and program support for the Stanford Institutes of Medicine and Interdisciplinary Programs
- Education
- Departmental faculty recruitments
- Interschool initiatives (e.g., BioX and Bioengineering)
- Information technology
- Departmental support to cover shortfalls due to implementation of the new funds flow model with Stanford Hospital & Clinics and for the school's new operating budget

Each of these investments is meritorious but all will need to be carefully evaluated pending the availability of new funding sources in FY07 and FY08.

To guide our planning for this current year and beyond, we are completing our School of Medicine long-term forecast, which will help us monitor and titrate future investments. We have a number of exciting opportunities before us along with some major challenges – especially for new and expensive facilities. While I am confident that we will be successful in the long run, it is important that we carefully assess our shorter term objectives and needs so that we can truly optimize our future institutional success.

Stanford Institutes of Medicine

On Saturday, October 29th I held a half-day retreat with the Directors and Associate Directors of the Stanford Institutes of Medicine and the Stanford Comprehensive Cancer Center. This is the second of an ongoing series of meetings. My overarching goal for these sessions is to enhance dialogue and communications among the Institute leaders and foster ways of the continued development of their Institutes. An important facet of this meeting was to assess where each Institute (as well as the Comprehensive Cancer Center) is in its individual development; we focused specifically on things that have been accomplished that would not have likely occurred if there were no institute. Another important topic was to address how the Institutes are coordinating their efforts with the School's basic and clinical science departments – again with the goal of enhancing interactions across our missions of education, research and patient care.

It was clear to me that significant progress is being made in developing core support services that will cut across the institution and provide help to faculty and students. In addition, each of the Institutes is engaged in helping to create additional resources that can be shared with departments (e.g., research support grants, support for faculty

recruitments/retention) and that will help make the overall institution stronger and more successful.

An additional goal is to further examine the progress of our three Strategic Centers (Genomics and Human Genetics, Imaging and Informatics) as individual entities and as integrating components with the Stanford Institutes of Medicine in enhancing our overarching objective of *Translating Discoveries*. We will further this discussion at a mini-retreat in December as a prelude to a broader discussion at the School's Leadership Retreat in January 2006. While there is clearly more to be accomplished I am pleased by how much progress has been made and, in particular, by the increased interactions that are occurring among the Institutes. The continuing dialogue with the Strategic Centers and the Departments will further define the ways that we can align and interconnect our resources within the School to truly make our "sum greater than the whole of its parts."

Honoring Teachers and Educators

On Thursday, October 20th Dr. Julie Parsonnet, Senior Associate Dean for Medical Education, and I hosted a thank you reception for the numerous faculty and community physicians who have contributed so much to our education programs. Each year countless members of the full time faculty and adjunct clinical faculty spend time with our students, residents and fellows sharing knowledge and experience. We are deeply indebted to each of these individuals and were happy to offer them our appreciation at this annual reception. Without their efforts Stanford would not be as outstanding a school of medicine as it is today. Thanks to all!

Wellness and Choice

A thank you luncheon for university staff and faculty was hosted by University Department of Human Resources on Tuesday, October 25th at the newly opened Arrillaga Family Sports Center. I had not been in this new facility until then but I can now say it looks wonderful. Particular notable are the extraordinary exercise facilities that are currently open from 7 .am. through 11 p.m. (there is a different schedule for the weekend). My only personal regret is that it opens so late in the morning – but hopefully that will change in time! These new facilities complement the many other resources available to the Stanford employees and students, which may be among the most remarkable for any university in the nation. The new facility prompted Provost John Etchemendy to encourage the Stanford community to pursue wellness as part of their daily routine – something that he has taken to heart during the past couple of years, especially given all the resources available to our community.

I would like to add to that wise advice. The data are quite conclusive that physical activity and exercise approximating 1000 kcal per week is enough to significantly reduce cardiac morbidity. This can be achieved by a whole variety of activities – from walking, biking, swimming – and of course running. Additional data suggest that physical activity and exercise reduces joint disease and even helps sustain mental acuity with aging (something that I am surely counting on). While that is the good news, it turns out that only about a third of Americans actually engage in a regular exercise routine. This small

percentage includes children as well as adults and certainly contributes to the rising incidence of obesity in the USA and globally, with all of its associated co-morbidities.

I think that the School of Medicine and Medical Center should be the role model for the university and broader community in promoting and taking part in programs that improve wellness and exercise. The resources to do so on campus are enormous and if those are inconvenient, I would hope that alternatives could be found in home communities. Of course I am aware of the time pressures so many of us face and the demands of trying to balance work and family. But in this regard the benefits for better health are worth the time involved. Plus, this year the university is planning to help provide a financial incentive to employees who engage in wellness as part of the University Benefits Program. See <http://benefitsu.stanford.edu/medical/medical/wellness.html>. So, I hope you will choose a physical activity and exercise that you enjoy – and then do it, every day if possible!

NIH Loan Repayment Programs (LRP) Application Cycle

Please be aware that The NIH Loan Repayment Programs (LRP) Application Cycle will close in less than 5 weeks on December 1, 2005. The five LRPs offered by the NIH include the Clinical Research LRP, Clinical Research LRP for Individuals from Disadvantaged Backgrounds, Contraception and Infertility Research LRP, Health Disparities LRP, and Pediatric Research LRP.

Through these programs, the NIH offers to repay up to \$35,000 annually of the qualified educational debt of health professionals pursuing careers in biomedical and behavioral research. The programs also provide coverage for Federal and state tax liabilities.

To qualify, applicants must possess a doctoral-level degree, devote 50% or more of their time (20 hours per week based on a 40-hour work week) to research funded by a domestic non-profit organization or government entity (Federal, state, or local), and have educational loan debt equal to or exceeding 20% of their institutional base salary. Applicants must also be U.S. citizens, permanent residents, or U.S. nationals to be eligible.

All applications for 2006 awards must be submitted online by 8:00 p.m. eastern time, on Thursday, December 1, 2005.

The online application and detailed information about the LRPs are available at www.lrp.nih.gov or by calling 866-849-4047.

Avian Flu 2005

There is hardly a newspaper or magazine that does not feature concerns about a potential pandemic from Influenza H5NI (also known as the avian flu). It goes without saying that these concerns are real. We know from history that such pandemics arise when a brand new strain, to which humans do not have prior exposure and immunity, arises and spreads

from person to person. We are all aware of the pandemic of 1918-1919 and the smaller but still serious ones of 1957-58 and 1968-69. Most everyone knowledgeable in infectious diseases acknowledges that another pandemic is probable in the immediate future. The question is when and with which strain of influenza and, of course, with what level of morbidity and mortality.

Certainly the reports to date are concerning, but they still demonstrate that the virus is largely spread among birds – including of course migratory flocks, which is one of the most alarming features of this virus from the point of view of global spread. In addition human infections to date have been restricted to those having close contact with infected birds, and a virus mutation that permits human-to-human transmission has not yet occurred. However, whether and when that might happen is a major source of concern. Based on the current epidemiologic data, a number of experts, including Dr. Tony Fauci, Director of the National Institute of Allergy and Infectious Disease, currently believe that such a mutation promoting human-to-human spread is unlikely this year – but all acknowledge that this is really just an educated guess.

While of course hoping that the virus transmission remains restricted to non-human hosts, I am convinced that it is imperative to make significantly greater efforts to assure an adequate supply of antiviral drugs (now in very short supply in the USA) and an effective vaccine (currently under development). As we have learned from recent natural disasters, planning for an avian flu pandemic will require local, regional and national coordination. At Stanford emergency planning efforts are underway, but these will be further ramped up to address epidemics and other potential disaster scenarios. But should (or when) an avian flu pandemic occur(s) we would need very close coordination with federal and state agencies as well as with drug and vaccine suppliers. This is the time to make sure that those connections are being made – while there is still time – since we may not have time at some point in the future, even in the next couple of years.

Parenthetically, while it still seems unlikely that we will see a pandemic with H5NI this year, we will certainly have a season of influenza. Accordingly, it is important for all eligible individuals (health care workers, young children, older adults, and those with compromised immune systems) receive an influenza vaccine – if not already done – in the next days to weeks.

To further inform you about epidemic preparedness, I am including the statement below from Dr. Martin J. Blaser, President of the Infectious Diseases Society of America.

Joint Position Statement of the Infectious Diseases Society of America and Society for Healthcare Epidemiology of America on Antiviral Stockpiling for Influenza Preparedness
The Infectious Diseases Society of America (IDSA) and Society for Healthcare Epidemiology of America (SHEA) recognize the importance of a coordinated national response to the threat of pandemic disease. Effective preparation for such a threat includes the development of safe and effective vaccines, comprehensive

infection control plans, and the thoughtful use of antiviral medications. Available antivirals are important adjuncts to influenza vaccination and infection control measures for responding to both seasonal and pandemic influenza disease. Indeed, greater use of antiviral agents for treatment and prevention of seasonal influenza will increase familiarity with these drugs by patients and practitioners and lead to increased production capacity. With the influenza season soon upon us, we must be mindful that antiviral medications will be needed for patients this year. In addition, because of the threat of pandemic influenza, IDSA and SHEA members, who have particular expertise in the area of infection control and prevention, should participate in the design and implementation of practical and effective policies for antiviral stockpiling for their health care institutions and patients.

Although many experts are concerned that the expanding avian influenza A H5N1 outbreak may result in a pandemic, it is not known when, or if, a pandemic might come, the specific virus that will ultimately emerge, and the associated health impacts. IDSA and SHEA recognize that accurate assessments of the impact of any strategy are difficult to predict prior to the pandemic, and that continuous refinement will be necessary as information becomes available. Currently, there are insufficient doses of antiviral drug available to protect the United States and the world against a pandemic influenza outbreak. Roche, the manufacturer of oseltamivir, is working to increase the supply. The company also recently has taken steps to assure the drug's availability during this year's influenza season by restricting its shipment to pharmacies until the isolation of influenza in the community.

National Stockpile

IDSA and SHEA advocate preparation, including greatly increased national antiviral stockpiling, for a pandemic threat. Currently the federal government has only enough oseltamivir treatment courses for approximately 1 percent to 2 percent of the population. The existing national antiviral stockpile is insufficient to meet the needs of all persons nationwide requiring treatment and/or prophylaxis if a severe pandemic occurred in the near future. This supply would be primarily targeted for short-term early treatment of affected persons, e.g., persons requiring hospitalization or persons at risk for severe influenza, and allow for prolonged prophylaxis only for highly selected risk groups. IDSA has strongly advocated expanding our national stockpile to include sufficient antivirals to treat at least 25 percent and ideally 40 percent of the population. The U.S. government has announced plans to substantially increase the national antiviral stockpile. However, the exact target is not public at present and substantial delays in procurement are expected.

Institutional Reserves

Health care facilities should have access to antiviral medications to reduce hospitalizations and mortality and maintain social order and function in the event of a severe pandemic. IDSA and SHEA advocate the involvement of our members

in the development of health care institutional antiviral policies and reserves to be used for treatment of patients and affected staff due to a pandemic or major influenza epidemic. The current shelf-life of newly manufactured oral oseltamivir capsules and of inhaled zanamivir disks is five years. Consequently, one minimal stockpiling approach would consist of a rotating stockpile that contains approximately five times as much drug as used in an average influenza season. Given the current shortage of antiviral drugs, institutions should not stockpile drug for prophylaxis of health care workers, as this strategy requires much greater drug supplies than early treatment, and could deplete the reserve necessary for treatment on a national level. However, if antiviral drug availability increases in the future, IDSA and SHEA recognize that post-exposure prophylaxis to control nosocomial outbreaks may be justified when one considers the cost and work disruption associated with illness and lost work time in health care workers, particularly at a time of critical need.

Personal and Family Stockpiles

Neither IDSA nor SHEA support the strategy of personal or family stockpiling of oseltamivir (Tamiflu) to prepare for influenza. This is consistent with the World Health Organization's recommendations. Oseltamivir is expected to be available in the private sector for prevention and treatment of seasonal influenza this flu season. However, excessive personal stockpiling would deplete these supplies and make less overall drug available for treatment of priority groups should a pandemic arise in the near future. Personal stockpiling would likely lead to inappropriate use and wastage, as well as foster antiviral drug resistance emergence under some circumstances. IDSA and SHEA also are mindful that neuraminidase inhibitors, such as oseltamivir, are expensive and, if shortages occur, persons who do not choose to stockpile or cannot afford to stockpile would have less access to the drug.

The CDC website (www.cdc.gov/flu) provides excellent information for families concerned about protection against seasonal or pandemic influenza. Education on cough etiquette, hand-washing, and annual influenza vaccination are highly appropriate. In the pandemic setting, additional measures may be recommended by public health authorities.

Appointment of Dr. Phil Lavori as Chair of Health Research & Policy

I am very pleased to announce that Dr. Phil Lavori, Professor of Health Research & Policy (HRP) has agreed to become the next Chair of the department of HRP at Stanford. Dr. Lavori, who trained as a mathematician, is an internationally recognized leader in biostatistics, clinical trials, longitudinal studies and trial design. He served as the Director of the VA Cooperative Studies Program Coordinating Center from 1992-2005, and he has been also playing a significant role in our planning to become an NCI-designated Comprehensive Cancer Center.

During the past couple of years we have been working with the department and co-chairs, Drs. Alice Whittemore and Rob Tibshirani, to help rebuild HRP, particularly in clinical epidemiology. I am extremely grateful to the work of Drs. Whittemore, Tibshirani and

their colleagues. Indeed, considerable strides have been made thanks to their efforts. We now look forward to work with Dr. Lavori and the faculty in HRP to continue to advance the department's important work biostatistics, epidemiology and health policy research. Please join me in welcoming Dr. Lavori as the new chair of HRP.

Appointment of Dr Geoff Rubin as Associate Dean for Clinical Affairs

I am pleased to announce that Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, has recommended Dr. Geoffrey Rubin, Associate Professor of Radiology, as the Associate Dean for Clinical Affairs. Dr. Rubin will dedicate approximately 30% of his time to this effort. He will work with Dr. Rizk on the strategic planning of clinical program development, the interface between patient care and clinical research, and refinements in the new funds flow process, among numerous other issues. Dr. Rubin has many wonderful skills and attributes and I am most pleased that he has agreed to serve in this important role.

Some Selected Events

2005 Beckman Symposium. On Wednesday, October 26th the 15th Beckman Symposium was held in the Clark Center Auditorium. This annual symposium has featured cutting edge science and has been a standard bearer of excellence. This year's symposium was entitled "*Sensation to Action*" and was sensational. Thanks to the efforts of Dr. Lucy Shapiro, Director of the Beckman Center, the Symposium Organizers Professors Richard Tsien and Liqun Luo and the Neuroscience Institute at Stanford, a remarkable series of speakers and presentations were held. The day was book-ended by 2004 Nobel Prize winner Linda Buck and 2000 Nobel Prize winner Eric Kandel. In addition, exceptional speakers from the international and Stanford community addressed leading edge research and clinical applications. Special thanks to the organizers and to the Beckman Center and the Neuroscience Institute at Stanford for putting together a truly remarkable event.

Jonathan King Lecture: The 15th Annual Jonathan King Lectureship was held on Wednesday evening. This year's lecturer was **Dr. Neal Baer**, former Executive Producer of ER and current Executive Director of Law and Order: Special Victims Unit. Through the medium of television Dr. Baer illustrated how he has used storytelling to raise awareness of challenging and compelling medical and ethical conundrums. He also illustrated how his important work has helped raise public awareness and education and thus reminded us of the important role we all have in helping to educate and enlighten each other and the public by sharing our real life experience as storytellers.

Thank you to Dr. Mary Lake Polan. On Thursday, October 27th, the friends, colleagues and trainees of Dr. Mary Lake Polan gathered in the Stanford faculty club to offer their thanks and appreciation for her 15 years of service as the chair of Obstetrics and Gynecology at Stanford. Under her leadership the department developed a highly regarded program in research, education and patient care – and we are all indebted to her many contributions. Dr. Polan's personal career has

go through a number of impressive stages. Her initial goal was to focus on basic research, and she prepared for that by receiving a PhD in Biochemistry and Biophysics at Yale, followed by postdoctoral training at the NIH. Recognizing that she wanted to apply research to improve human health, Dr. Polan returned to Yale to complete her MD, trained in obstetrics and gynecology, and began a productive career as a physician-scientist. She followed this with the impressive effort of building an excellent department of obstetrics and gynecology at Stanford that emphasizes excellence in patient care, research and education. Dr. Polan's career has continued to evolve and has expanded to address important international issues, which have as their hallmark her efforts in Eritrea. Dr. Polan is currently completing a sabbatical at Columbia University in NYC, and it was great to have her back at Stanford so that we could honor her for her tremendous years of service as Professor and Chair of Obstetrics and Gynecology, 1990-2005.

New Endowed Professorships

During the past two weeks I had the privilege of hosting two events to honor newly named endowed professorships. Both were the result of the efforts of the Lucile Packard Foundation for Children's Health, and each was named in honor of a former Stanford faculty member who has made enduring and significant contributions to child health and academic medicine.

The Richard E. Behrman, MD Professorship in Child Health and Society has been named in honor of one of the true leaders and pioneers in neonatology and academic medicine. The first incumbent of this new professorship is Dr. Paul Wise, an internationally recognized expert in health outcomes research and international medicine.

The Lawrence Crowley MD Endowed Professorship in Child Health honors Dr. Larry Crowley, former Dean and Vice President of the Medical Center, who was instrumental in bringing the Lucile Packard Children's Hospital to realization. The first incumbent of this new chair is Frank L. Hanley, Professor of Cardiothoracic Surgery, one of the most respected and accomplished pediatric heart surgeons in the world. Dr. Hanley has played an important role in helping LPPH achieve its current status as one of the nation's leading academic children's hospitals.

We had the distinct honor of having the individuals for whom the newly created chairs were named – as well as their first incumbents – at these special events. Please join me in congratulating Drs. Richard Behrman, Paul Wise, Larry Crowley and Frank Hanley.

Upcoming Events

Community Lecture Series, Wednesday, November 2, 2005 at 7 p.m. in the Clark Center Auditorium. Thomas Krummel, MD and Michael Longaker, MD, will present: *Surgery Outside the Box: Translating Discoveries to Improvements in Patient Care*. They will discuss the groundbreaking work in the field of tissue engineering as their search for

replacement tissues and “spare parts” moves from an unsolved problem at the bedside to the laboratory bench.

Awards and Honors

- ***Drs. Emmanuel Mignot and Steve Fortmann*** were elected to the Institute of Medicine. As noted by its President, Dr. Harvey Fineberg, election to the Institutes of Medicine of the National Academy of Sciences “*recognizes those who have made major contributions to the advancement of the medical sciences, health care, and public health. It is considered one of the highest honors in these fields.*” Accordingly it is a great pleasure to share with you that Dr. Emmanuel M Mignot, Professor of Psychiatry and Behavioral Sciences and Investigator, Howard Hughes Medical Institute and Dr. Stephen Fortmann, CF Rehnborg Professor of Medicine and Director of the Stanford Prevention Research Center, were among the 64 new members elected to the IOM on October 24, 2005. Please join me in congratulating Drs. Mignot and Fortmann.

Appointments and Promotions

- ***Michael Clarke*** has been appointed to Professor of Medicine (Oncology), effective 11/01/05.
- ***Geoffrey Rubin*** has been promoted to Professor of Radiology, effective 11/01/05.
- ***Upinder Singh*** has been reappointed to Assistant Professor of Medicine (Infectious Diseases and Geographic Medicine), effective 11/01/05.

Dean’s Newsletter November 14, 2005

Science and Religion

I have previously commented on the evolving anti-science mood in this country and elsewhere (see: http://deansnewsletter.stanford.edu/archive/10_03_05.html). This disturbing trend was clearly and, in my view, distressingly, demonstrated in last week’s vote in the state of Kansas to redefine science to make it less evidence based – presumably to open the door to teaching creationism in public schools. In contrast, the citizens of Dover, Pennsylvania voted to remove members of their school board who were proponents of teaching “intelligent design” in public schools. However, I was quite disconcerted by the Reverend Pat Robertson’s wrathful reaction to this result; he virtually condemned the citizens of Dover. I should quickly add that I respect the right of citizens everywhere to have their point of view and to express it in ways supported by our republic. But I also must admit to being deeply concerned by the seemingly widening gulf that separates blue states from red states (or, more accurately, blue and red

communities within states) or that increasingly seems to be promoting theocracy over democracy. Among the founding and still fundamental principles of our nation are freedom of religion and the separation of church and state. I recognize that interpretation of these principles is open to debate and discussion but certainly, from my perspective, extremism on any account is unacceptable.

I also hasten to add that I am equally disturbed by public positions of scientists that are disparaging of religion and faith. Science and faith are not mutually exclusive; they are different aspects of our human experience and should each be respected. In my opinion it is not productive to attempt to apply scientific methodology to faith or religion or to invoke religion to explain the underpinnings and evidence of science. However, such confusion is taking place in various sectors of our society and, to varying extents, is even being promoted. This becomes even more distressing when one group attempts to dominate others, as is being done by some Christian Evangelical groups in ways that ignore or dismiss other religious or faith based beliefs or traditions. When potential religious oppression becomes politically based, the fine line is crossed between democracy and theocracy – something deserving our vigilance and engagement if we are to protect the freedoms we enjoy.

In this context it is not ironic that on November 4th and 5th the School of Medicine joined with the Office for Religious Life to co-host a visit to Stanford of His Holiness the 14th Dalai Lama. Three events took place. The first offered a meditation experience led by the Dalai Lama and the opportunity to hear his views on Buddhism and the human condition. The second addressed the important issue of non-violence in a dialogue between the Dalai Lama and Scotty McClennan, Dean for Religious Life. The third was an all day conference with the Dalai Lama sponsored by the School of Medicine entitled “*Craving, Suffering and Choice*.” The conference brought together neuroscientists and Buddhist scholars to share their perspectives and opinions about how each interprets, understands and brings clarity to these dimensions of human experience. Planning for this conference was nearly a year in the making and was wonderfully led by Dr. William Mobley Cahill Professor in the School of Medicine, Professor of Neurology and Neurological Sciences, and Director of the Neuroscience Institute at Stanford. The entire day’s events have been archived and are available for viewing at <http://www-med/events/dalailama/index.html>. Articles and videos about all of the events can be found in the November 9th **Stanford Report** (see: <http://news-service.stanford.edu/news/2005/november9/dalai-110905.html> and <http://www.med.stanford.edu/events/dalailama/index.html>).

I want to thank the numerous individuals who made this visit possible – beginning with my wife, Peggy Pizzo, who was the inspiration for the event, and whose collaboration with Tenzin Tethong, President of the Dalai Lama Foundation of Palo Alto and Lecturer in the Continuing Studies Program, facilitated the official invitation that came from Dean McClennan and me. But the visit would never have been as wonderful as it turned out without the incredible efforts of a large group of individuals lead by Kathy Gillam, Special Assistant to the Dean, as well as Kristin Goldthorpe and Neyll Vargas from the

Dean's Office, along with the wonderful work of Elaine Enos, Executive Director, Stanford Public Events and her staff.

From my perspective, what defined the Stanford event, and differentiated it from some of the more acrimonious debates and divisions occurring across our nation, was the acknowledgement that science and faith are separate and discrete and that each deserves respect and value. Eschewing extreme positions, the participants in our conference were willing to share perceptions and data respectfully and to allow evidence to help explain and elucidate the human experience. There was no attempt to redefine science or religion; rather, there was agreement to respect each for what it brings and contributes to our discourse. There is no question that most humans treasure faith and that it takes on various forms of expression and belief. It can offer solace in a world often lacking comfort and security, especially at the boundaries of the human experience. However, at its core faith is unlikely to ever be defined empirically. And while faith can offer a context for human experience it is also unlikely to elucidate the principles of cosmology, physics or biology.

It is for these reasons that I believe that a shared respect for the differences between faith and science is vitally important and that conversations such as those we shared with His Holiness the Dalai Lama are extremely valuable. I recognize that such discussions are difficult and that history has not often embraced them. But history has also taught us the consequences of imposing one viewpoint on another – and the dangers that can emerge when religion and fervent righteousness become political forces. We need to move forward in our human evolution and not regress to the flawed passions of the crusades, the suppression of science by religion, or the intolerance of theocracy over freedom of the human spirit.

The State of Stem Cell Research

A year has passed since the historic vote by nearly 60% of the citizens of California to support stem cell research through a \$3B bond initiative known as Proposition 71. The passage of Proposition 71 resulted in the California Institute of Regenerative Medicine (CIRM), which is overseen by the 29- member Independent Citizens Oversight Committee (ICOC), on which I serve. On Saturday, November 12th, the Net Impact Conference sponsored by the Graduate School of Business provided an opportunity to reflect on the state of stem cell research in California and elsewhere. I chaired a panel discussion at the conference that included Bob Klein, Chair of the ICOC and the inspiration and driving force behind Prop 71, Hank Greely, Johnson Professor of Law and Professor of Genetics and an expert in health policy as well as bioethics, and Amy DuRoss, Chief of Staff of the CIRM and a graduate of the GSB. Our panel discussion afforded an opportunity to reflect on where we are – and the problems and challenges that remain to be overcome.

There is no question that the passage of Prop 71 was an historic event that has propelled the debate regarding stem cell research throughout the USA and world. Stem cell research engages science and politics (at the local, state, federal and global levels) along with religion, ideology, ethics, money and intrigue. It is a unique case study of the

opposing forces of science and religion (see above) and raises fundamental questions about the origins of life, the value of research and how strongly held positions are bridged or breached.

The vast majority of Californians and the majority of citizens of the US are of the view that embryonic stem cell research should be supported and funded. However, there are states in the US where it has been outlawed, bills before Congress that would criminalize it, and a UN proposition (sponsored by the US) that would ban it. Ironically, this area of research offers exceptional promise to elucidate the mysteries of human development, better understand the genesis of serious disease and provide platforms to develop new therapeutic or preventive strategies. I strongly believe that research in both adult and embryonic stem cells should proceed under the regulations published by the National Academy of Sciences (NAS) earlier this year. Indeed we have prepared for this effort through the initiation of the Stanford Institute for Stem Cell Biology and Regenerative Medicine and its related Program in Regenerative Medicine that encompasses education, research (and facilities), policy and ethics.

During the past year the CIRM and the ICOC, in tandem with the efforts of the NAS, have made considerable strides in defining standards for stem cell research. In addition, we have developed principles for grant review, appointed a nationally recognized scientific review group, surveyed leading researchers from throughout the world to define the scope of needed stem cell research, and approved the first group of training grants that will help develop the pipeline for future investigators. Ironically, despite these examples and considerable other progress, funding has not yet begun because the constitutional right of the state to issue the bonds has been challenged by at least two lawsuits. And while these legal challenges will have an important benchmark on November 17th when they come before the Judge in Alameda County, it is also likely that these legal entanglements will continue – further delaying the ability of the CIRM to distribute funds. Most everyone believes that they will ultimately be dismissed, but by then funding for the CIRM could have been delayed for nearly 2 years. Given the broad support for Prop 71 it is sad that the actions of a few are holding up what promises to be an incredibly important area of investigation.

Despite these delays I remain very optimistic. We have put a lot of systems in place during the past year – at Stanford, in California and nationally – that will help assure that stem cell research is carried out with the highest ethical standards and integrity. Moreover, we have continued to make important discoveries and have attracted significant scientists from outside California to join our efforts. We have continued to educate the public and have achieved increasing support to permit this extremely important area of research to proceed. Of course, this will not truly happen until the funding lines are open, but I do very much believe that this will occur in 2006. But we all need to remain engaged to make sure this happens – for the sake of the future generations who will be the beneficiaries of these efforts.

Appointment of Jonathan Berek as Chair of Obstetrics and Gynecology

I was very pleased to announce on Monday November 7th that Dr. Jonathan Berek, Professor and Executive Vice Chair of the Department of Obstetrics and Gynecology at UCLA, accepted my invitation to come to Stanford as our next Chair of the Department of Obstetrics and Gynecology. Dr. Berek will begin his work at Stanford on December 15th and he will transition during the weeks and months ahead.

Dr. Berek is an internationally recognized academic leader with special expertise in gynecologic oncology and is the co-editor of the major textbook in this field, *“Practical Gynecological Oncology.”* In addition, the Berek and Novak edition of *“Gynecology”* is also in press. He is a highly regarded physician, clinical investigator, educator and administrator and has won the praise and respect of colleagues around the nation. I am confident that he will be an outstanding new leader at Stanford and I am most pleased to welcome him to our community.

Dr. Berek will succeed Dr. Mary Lake Polan, who served as chair during the past 15 years and who helped build the department’s outstanding clinical and research programs. I want to thank Dr. Polan for the many contributions that she has made to Stanford over her highly productive career here (see also Dean’s Newsletter <http://deansnewsletter.stanford.edu/#11>).

I am also very pleased to announce that Dr. Berek has advised me that he has asked Dr. Maurice Druzin to serve as the Vice Chair of the department. I am very pleased by this recommendation in light of Dr. Druzin’s many contributions over the years – including his very admirable service as acting chair during various transition periods.

I also want to thank Dr. Linda Shortliffe, Professor and Chair of the Department of Urology for her leadership as the chair of the Search Committee that identified Dr. Berek as the chair candidate. Many thanks as well, of course, to the search committee for their wonderful work.

We are at a juncture of important transitions and opportunities at Stanford and I am very pleased that Dr. Jonathan Berek will play an institutional leadership role on behalf of women’s health and the future of obstetrics and gynecology. Please join me in welcoming Dr. Berek to Stanford.

Facilitating “Translating Discoveries”

Dr. Lucy Shapiro, Virginia and D. K. Ludwig Professor and Professor of Developmental Biology, and Director, Beckman Center for Molecular and Genetic Medicine, has informed me that eight new Beckman Interdisciplinary Translational Research Program (ITRP) Awards have been made. Each of the eight new awards provides research funding in the amount of \$150,000 over a three-year period. This important program – which helps to facilitate “translating discoveries” – is supported by funds from the Beckman Center and the Dean’s Office.

The Review Committee for the ITRP Awards received 38 outstanding applications this year and was able to make 8 awards. The 18 faculty members receiving research funding

from these awards represent 13 separate disciplines from three separate schools at Stanford (Medicine, Engineering, and Humanities and Sciences). This wide array of disciplines certainly speaks well for the interdisciplinary and collaborative spirit of research that is fostered here at Stanford University. They include the following:

2005 Beckman ITRP Award Winners

Project:	Dendritic Cell Function During Viral Infection
Faculty:	Edgar G. Engleman, MD, Professor of Pathology Karla Kirkegaard, PhD, Professor of Microbiology and Immunology
Project:	Development of a High Throughput Experimental System for the Mammalian Oocyte and Embryo
Faculty:	Stephen R. Quake, PhD, Professor of Bioengineering Mylene W.M. Yao, MD, Assistant Professor of Obstetrics and Gynecology
Project:	Development of Integrated Optical Bio-sensors and Fluorescent Molecular Imaging Probes for Continuous Real-time Monitoring of Stem Cells in Living Subjects
Faculty:	Sanjiv Sam Gambhir, MD/PhD, Professor of Radiology James S. Harris, PhD, Professor of Electrical Engineering
Project:	Investigation of Movement-Related Neural Activity from Premotor Cortex in Patients with Parkinson's Disease
Faculty:	Jaimie M. Henderson, MD, Assistant Professor of Neurology and Neurological Sciences Krishna Shenoy, PhD, Assistant Professor of Electrical Engineering
Project:	Minimally Invasive Cellular Level Imaging in the Inner Ear for Diagnosis Intervention using Fluorescence Microendoscopy
Faculty:	Mark J. Schnitzer, PhD, Assistant Professor of Biological Sciences Nikolas H. Blevins, MD, Assistant Professor of Otolaryngology
Project:	Optimizing Microdialysis for Monitoring Organ Failure in the Intensive Care Setting
Faculty:	Steven R. Alexander, MD, Professor of Pediatrics Harvey Cohen, MD/PhD, Professor of Pediatrics Joseph DiCarlo, MD, Assistant Professor of Pediatrics Paul Yock, MD, Professor of Bioengineering
Project:	Proteomic Analysis of Immune Complexes in Rheumatoid Arthritis
Faculty:	Mark C. Genovese, MD, Associate Professor of Medicine William H. Robinson, MD/PhD, Assistant Professor of Medicine Richard N. Zaire, PhD, Professor of Chemistry

Project: Translating Hydrogel Technology into Novel Engineered Liver Tissues
Faculty: Curtis W. Frank, PhD, Professor of Chemical Engineering
Jeffrey S. Glenn, MD/PhD, Assistant Professor of Medicine

This is a great collection of exciting projects - congratulations to all the award winners!

A Pediatric Exemplar of Translating Discoveries

The recruitment of Dr. Michael Edwards to Stanford to lead the pediatric neurosurgery program at the Lucile Packard Children's Hospital has been transformative. An internationally esteemed neurosurgeon, Dr. Edwards has contributed significantly to the Department of Neurosurgery's clinical programs as well as its research and education missions. At the Board of Directors meeting of LPCH on Tuesday November 1st, Dr. Edwards described some of the unique features he has found since joining Stanford just over a year ago. Among the most notable is the close connection of the hospitals (both LPCH and SHC) with the School of Medicine and University. He noted that this physical proximity has played an important and essential role in fostering his opportunity to truly advance the field of pediatric neurosurgery and neuroscience.

Dr. Edwards highlighted the important role that the Neuroscience Institute at Stanford has been playing in fostering interdisciplinary research and cited in particular the exciting opportunities now emerging in the study of pediatric brain tumors. Central nervous system malignancies in children represent the most common solid tumor in pediatrics and are second only to leukemia in their prevalence. Unfortunately, unlike the success story of progress in curing childhood leukemias, most pediatric brain tumors have been refractory to therapeutic intervention., Dr. Edwards described the collaborations now emerging through the Neuroscience Institute at Stanford in conjunction with LPCH that will hopefully lead to new and novel approaches in the future. The diversity of the collaborations is noteworthy. They include Dr. Matt Scott, Professor of Developmental Biology and Genetics and Bioengineering and Program Director for BioX, and Dr. Paul Fisher, Associate Professor of Neurology and Neurological Sciences, and of Pediatrics, and by courtesy of Neurosurgery, among others.

These collaborations provide tangible evidence that when outstanding clinical leaders join with exceptional scientists new opportunities for dialogue and for advancing the field of medicine and science occur. They are great exemplars of interdisciplinary research, translational medicine and the collaboration between the Stanford Institutes of Medicine with basic and clinical science departments. I am pleased that these interactions are occurring and look forward to the findings and innovations that will emerge in the years ahead.

University Institute Initiatives

As you know from prior Dean's Newsletters, considerable progress is being made in aligning the University under an overall umbrella that define how Stanford can help impact the world in important ways. Three major themes have been delineated:

Improving Human Health, Sustaining and Protecting the Environment and the Stanford International Initiative. In each area new program development is taking place, and I want to call your attention to some of the areas of progress as they evolve. One of these took place at the October 27th meeting of the Senate of the Academic Council, when Professors Elisabeth Pate-Cornell and Chip Blacker, Co-chairs of Stanford University's International Initiative, announced the **Presidential Fund for Innovation in International Studies**, a \$3 million fund to support collaborative, interdisciplinary faculty research of international scope. They presented a Request for Proposals and strongly encouraged all faculty to apply. I am reprinting the Request below for your information, and I encourage School of Medicine faculty to apply.

The Office of the President and the Freeman Spogli Institute for International Studies at Stanford University are pleased to announce the establishment of the Presidential Fund for Innovation in International Studies. The purpose of the fund, which is an important component of Stanford's new International Initiative, is to stimulate the formation of interdisciplinary teams of Stanford faculty interested in exploring critically important issues in international studies, including their historical or cultural antecedents. Preference will be given to scholarly collaborations that focus on three sets of issues: enhancing the prospects for peace and security worldwide; improving and reforming governance in all its forms and at all levels of society; and advancing human wellbeing. The competition for funding is open to faculty from all seven of Stanford's schools, as well as senior fellows associated with the University's research institutes and centers and the Hoover Institution. The sponsors anticipate that the Presidential Fund for Innovation in International Studies will support three to four new projects in each of the next three years ('05-'08) for periods ranging from one to three years. Proposals to secure support should conform to the following guidelines:

- Projects must have an international focus, with priority in funding being accorded to those proposals emphasizing peace and security, governance, and human wellbeing.
- Projects must be based on collaborative research and teaching, involving faculty from two or more disciplines and, wherever possible, from two or more schools. They must give evidence of true interdisciplinarity in the design of research questions and in the proposed implementation and dissemination of research findings (which may include new curricular offerings at both the graduate and undergraduate levels).
- Funds will be awarded on a competitive basis. Project awards may be of any amount, but will typically be in the range of \$50-100,000 per year for a maximum of three years. The awards are not renewable.

- Funds may also be allocated to support research and teaching of a more preliminary nature. These planning grants will be no more than one-year in length (non-renewable) and on the order of \$10-15,000.
- The deadline for submitting proposals is December 31, 2005. Awards will be announced on or about February 1, 2006. Faculty interested in securing support through the Presidential Fund for Innovation in International Studies should obtain details on the PFIIS website:
<http://fsi.stanford.edu/pfiis/>.

In addition, at the November 10th Senate of the Academic Council, Dr. Jeff Koseff, Professor of Civil & Environmental Engineering & Senior Fellow at the Stanford Institute on the Environment (SIE) gave an update on the Environmental Initiative. He began by reviewing the mission of the SIE, which he chairs, and notes the three major goals: To generate new ideas and approaches; to educate and train the next generation of leaders; and help decision makers solve problems. Stanford is uniquely poised to address these issues, given the excellence of our existing academic programs, our co-location on a single campus and the clear history and spirit of interdisciplinary collaboration and interaction in research and education. Professor Koseff described ways of accomplishing the goals, including a “Ventures Project” that provides seed funding for transformative interdisciplinary research. The Institute has already sponsored its first round of funding, usually \$75,000 for two years – and they have received exciting proposals (in a manner similar to the Beckman Interdisciplinary Translational Research Awards noted above). In addition the Institute is proposing to sponsor 4-6 strategic collaborations to pursue exciting themes (e.g., a Center for Oceanic Studies).

A common thread among the university initiatives and those being developed in the School of Medicine is interdisciplinary research and education – and ways to foster and encourage them at Stanford. These are truly exciting and will surely help to transform our university – and hopefully, as a consequence, the world we live in.

Update on Stanford Medicine magazine

The Fall issue of Stanford Medicine magazine focuses on neuroscience. Among the contents in the special report are:

- Introspection on having brain surgery from Pulitzer-winning writer Jimmy Breslin.
- Excerpts from the Dalai Lama's discussion on Buddhism and neuroscience with the director of Stanford's Neuroscience Institute, William Mobley, MD, PhD.
- The latest research on pain. Stanford scientists explain: It's all in your head.
- Tips on preparing the mind for learning.
- A report on attempts to heal stroke damage by injecting neurons into the brain, featuring the work of neurosurgery professor Gary Steinberg, MD, PhD.

The issue also offers medical center news, research updates, an alumni profile and an in-

depth look at a tool that revolutionized research and is starting to make an impact in patient care-the DNA micro array, invented by biochemistry professor Patrick Brown, MD, PhD.

Look for the magazines in departmental offices and online at <http://mednews.stanford.edu/stanmed/2005fall/>. To obtain copies, please send e-mail to sharknes@stanford.edu.

Honoring Dr. Oscar Salvatierra

On Friday evening November 11th colleagues and friends of Dr. Oscar Salvatierra, Professor Emeritus of Surgery and Pediatrics, gathered at the Palo Alto Sheraton Hotel to offer gratitude and tribute to his remarkable career. Sponsored by the School of Medicine, the Department of Surgery and the Division of Transplantation, the evening was masterfully hosted by Dr. Carlos Esquivel, the Arnold and Barbara Silverman Professor of Pediatric Transplantation and of Surgery and Chief of the Division of Transplantation. The evening featured commentaries delivered in person or by video from leaders in transplantation from around the nation as well as colleagues and patients of Dr. Salvatierra. From these a common theme and portrait was apparent – which is once I share. Namely, Dr. Salvatierra is a remarkable individual – an outstanding surgeon, innovator, investigator and caring and compassionate physician who is beloved and respected by his colleagues and patients. But equally, the picture is one of a selfless individual who willing shares credit, supports and mentors young people and who believes in his life and words that actions and accomplishments are a reflection of a community and team working together. It is, in his words, about people and their relations one with another that are transformative.

While Dr. Salvatierra has reached the point in his career where he will no longer be performing surgery, he thankfully has much more to give to our academic community. His recent wonderful contributions as the faculty leader for our recent LCME review are but one example of his leadership and advocacy. I am also confident that his new role as a Faculty Advisor to medical students will be a wonderful contribution for the future.

Please join me in thanking Oscar for all that he has done during his career and since coming to Stanford – and in continuing to look for ways that we can benefit and learn from his knowledge and compassion.

Upcoming Events

On Wednesday, December 6th, Drs. Michael McConnell, Geoffrey Rubin, Alan Yeung, and Kai Ihnken will present: *Advances in the Diagnosis and Treatment of Coronary Artery Disease*. These Stanford heart specialists will provide educational information about the latest innovations in the diagnosis and treatment of coronary artery disease, which is the most common type of heart disease. This Community Lecture Series will be held at 7 pm in the Clark Center Auditorium.

Awards and Honors

- **Rebecca Ihrie** was among eleven doctoral students selected as the first Lieberman Fellows. These fellowships are for graduate students who intend to pursue careers in university teaching and research, and who have demonstrated potential for leadership roles in the academic community. Congratulations to Rebecca for her wonderful achievements.
- **Dr. Emmet Keefe**, Professor of Medicine has been elected to the American Clinical and Climatological Association, as well as American College of Physicians – two wonderful honors. Congratulations to Dr. Keefe.
- **Dr. Chang-Zheng Chen**, Assistant Professor, Baxter Laboratory, Microbiology and Immunology, and **Dr. James Chen**, Assistant Professor, Molecular Pharmacology, have been appointment to be the Terman Fellows to represent the School of Medicine. Congratulations to both.
- **Dr. Marlene Rabinovitch** will delivery the Dickinson W. Richards Endowed Lectureship of the Council on Cardiopulmonary Perioperative and Critical Care on November 15th at in the 2005 Annual American Heart Association Scientific Sessions in Dallas, Texas. Congratulations to Dr. Rabinovitch.

Appointments and Promotions

- **Anthony Burgos** has been reappointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 6/01/06.
- **Luis DeLecea** has been appointed to Associate Professor of Psychiatry and Behavioral Sciences, effective 11/01/05.
- **Jason Dragoo** has been appointed to Assistant Professor of Orthopaedic Surgery, effective 11/01/05.
- **David Drover** has been promoted to Associate Professor of Anesthesia, effective 11/01/05.
- **Rebecca Fahrig** has been reappointed to Assistant Professor (Research) of Radiology, effective 6/01/06.
- **Alice Guardino** has been appointed to Assistant Professor of Medicine (Oncology), effective 11/01/05.
- **Paul Heidenreich** has been promoted to Associate Professor of Medicine (Cardiovascular Medicine), effective 11/01/05.
- **Robert Siegel** has been reappointed to Associate Professor (Teaching) of Microbiology and Immunology, effective 9/01/06.

- **Eric Sokol** has been appointed to Assistant Professor of Obstetrics and Gynecology, effective 11/01/05.
- **Jacques Van Dam** has been reappointed to Professor of Medicine (Gastroenterology and Hepatology), effective 4/01/06.
- **Robert West** has been appointed to Assistant Professor of Pathology at the Palo Alto Veterans Affairs Health Care System, effective 11/01/05.
- **Jeffrey Yao** has been appointed to Assistant Professor of Orthopaedic Surgery, effective 11/01/05.

Dean's Newsletter

November 28, 2005

Our March Toward Enhancing Diversity

At the November 18th Executive Committee, Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, presented an update on the progress she and her colleagues are making toward our goal of enhancing diversity and leadership throughout the School of Medicine. The Strategic Planning Working Group, established by Dr. Valantine to develop a strategic plan for the Office of Diversity and Leadership, has defined the following vision statement for the School in this area: *"The Stanford University School of Medicine is a global model for diversity and leadership. Our faculty champions a diverse and inclusive community which is the inspiration and foundation for our excellence and achievements."*

The Office of Diversity and Leadership, which we launched a year ago, is committed to a diverse community of faculty, students, trainees and staff. In the initial phase of the work of the Office, Dr. Valantine is focusing on faculty. The Office seeks to accomplish greater faculty diversity through recruitment and retention efforts and stronger faculty leadership through a variety of faculty development opportunities. These goals, while laudable, are a challenge to implement and require time and commitment to fully achieve. But we are committed to them. In her presentation, Dr. Valantine delineated five overarching strategic initiatives and discussed the steps that will be taken to achieve them. I will summarize her comments briefly:

Initiative #1. *Develop and monitor policies, strategies and resources for the recruitment of a diverse faculty:* To accomplish this initiative, Dr. Valantine proposes, among other activities, to instill increased departmental accountability for faculty searches in the area of developing and considering more diverse candidate pools. I support this objective. To assist departments in their efforts in this area, Dr. Valantine intends to develop expanded databases and other resources to identify diverse and talented pools of potential faculty candidates. Part of this initiative includes the possibility of a visiting scholars program that would bring

potential faculty to Stanford for a limited time. Of course, the ultimate selection of individuals (be they faculty, students, or staff) must be based on the consideration of candidates who will sustain Stanford's position as a leading research- intensive school of medicine.

Initiative #2. *Develop and monitor policies, strategies and resources for the retention of a diverse faculty. Develop mechanisms to coordinate and integrate diversity programs and resources across the School of Medicine community.* To advance this initiative Dr. Valentine will conduct meetings with faculty to review the outcomes of the 2003 Provost's Quality of Life survey and to seek ways to improve outcomes and areas of dissatisfaction. Importantly, she and her colleagues will seek ways to develop improved community networking in order to find ways to overcome the sense of isolation reported by some faculty and students. Improved mentoring for all faculty is another key objective. And, to retain talented members of our community, the Office of Diversity and Leadership will work with the Office of Academic Affairs to provide support to faculty in order to make their retention at Stanford the most desirable prospect.

Initiative #3. *Recognize, reward and hold faculty accountable for leadership and diversity activities.* To accomplish this goal it is important to develop the incentives and levers that hold all School leaders accountable for improving and enhancing diversity (e.g., awards for leadership and diversity). Sharing best practices among the departments and divisions of the School will be helpful and important in heightening awareness and opening a broad dialogue within the School about ways to foster and improve diversity and leadership.

Initiative #4. *Identify and develop individual leadership potential at early stages of faculty careers and develop a menu of leadership opportunities to meet individual needs.* A number of actions are now being taken to launch this initiative, including the announcement of a "School of Medicine Faculty Fellows Program" (see below) and the recently initiated "Physicians Leadership Program." Additional activities will include starting mentoring programs and sending promising individuals to national programs designed to enhance leadership skills.

Initiative #5. *Define and promulgate a shared understanding of faculty leadership in a diverse community and a shared understand of diversity and its value to the School of Medicine.* Key to this initiative will be designing and implementing a broad series of activities to build a sense of community among our faculty, students and staff and to engage senior leaders in the school to act as change agents committed to enhancing diversity and to finding new ways to accomplish this goal.

I fully recognize that a commitment to diversity and leadership is long-term effort, but we already know we can be successful at it if we are fully engaged. For example, the success of our medical school admissions and increasingly our graduate admissions is testimony to concerted efforts by key leaders over long periods of time. We need to do the same for

postgraduate training and, most importantly, for faculty development. One of our biggest challenges is the loss of highly talented individuals once they graduate from our MD or PhD programs. We need to find ways to better balance those losses and permit highly qualified graduates to continue at Stanford (or to return) once they have completed their education. I am often reminded of the success we learned about from Drs. Scott Bass and Freeman Hrabowski in improving diversity at the University of Maryland, Baltimore County. They attribute their success to an embracing of diversity by the entire community and a broad commitment to achieving and sustaining it. We too must embrace that commitment if we are to be successful in achieving our goals. I certainly share that goal.

Announcing the School of Medicine *Faculty Fellows Program: Diversity and Leadership*

As part of our initiatives on improving diversity and leadership (see above), Dr. Hannah Valantine, Senior Associate Dean of the Office of Diversity and Leadership has recently announced the launch of the ***Faculty Fellows: Diversity and Leadership*** program.

In this new program a select group of 10-12 assistant professors will be chosen as Faculty Fellows for the 2005-06 academic year. The purpose of the Faculty Fellows program is to identify and develop the leadership skills of a diverse group of junior faculty who have the potential to become leaders in the School of Medicine.

During the year, Fellows will meet together approximately once a month for an informal dinner with key University leaders. During these sessions Fellows will learn more about leadership philosophy, strategy and style – under the banner of “Personal Leadership Lessons.” Fellows will dialogue with colleagues and explore their own ideas on how to address leadership challenges as their careers develop. On a monthly basis they will also meet in small groups with a senior faculty member or professor emeritus, who will be their assigned mentor. Each Fellow will also be assigned a personal coach and will meet regularly with this individual to explore personal career and leadership issues.

If you are interested in being nominated for this opportunity, please speak with your Department Chair or Dr. Hannah Valantine (hvalantine@stanford.edu). Nominees should be assistant professors who have demonstrated an interest in and potential for leadership roles in the School of Medicine. Such individuals need to be respected by their colleagues and have demonstrated an ability to influence others. In addition, they should be advocates for change and for increasing the diversity of the School of Medicine. They should have demonstrated the ability to think strategically and systemically and lastly, they should be interested in taking on leadership roles in the future.

Nominees should have the potential for leadership and have demonstrated an interest in taking on leadership roles in the School of Medicine. Such individuals should have the respect of their colleagues, and should have demonstrated the ability to think strategically and systemically and influence others. In addition, they should be advocates for change and for increasing the diversity of the School of Medicine.

You can obtain a nomination form by contacting Barb Miller at bemiller@stanford.edu or at 5-8402. Nominations are due by December 16, 2005. Our selection committee, co-chaired by Dr. Valentine and myself, will announce the selected Fellows by mid-January.

The Physician and Society

I grew up with the notion that physicians play an important role in society. And I still believe that the contract between the doctor and patient – whether an individual or a population – remains worthy of respect and care. At the same time I have communicated my increasing concerns that during the past years that medicine has had a more troubled relation with society and in some instances has fractured or even lost the public trust. Clearly we need to do all we can to better align the role and value of the physician in society.

At the November 15th meeting of the Health Science Policy Board of the Institute of Medicine, which I have chaired during the past three years, we heard presentations on a spectrum of important issues that challenge the role of physicians in society. These included the emergence of new technologies and innovations that permit us to better probe the human consciousness in ways that might permit the selection (or denial) of individuals for certain positions or responsibilities. These innovations might also predict individuals at risk for certain types of behavior. Such advances are leading to the emerging field of neuroethics, in which Stanford is already playing a leading role, thanks to the work of Dr. Judy Illes, Professor Hank Greely and others. Obviously continued progress in this area will open new vistas as well as challenges for defining the role of physicians and other professionals in broader societal issues. Similar issues were discussed around the topic of stem cell research – where Stanford is also playing a role.

In contrast, two disturbing issues were also discussed. One was the commercial influences on medical practice – a topic I have previously addressed in a Dean's Newsletter story that was based on the observations of Dr. Jerry Kassirer, former Editor of the New England Journal of Medicine and author of the recent book "*On the Take*" (www.onthetake.net). While further review and discussion of this topic is important – and will no doubt occur – an issue that I must admit we have not had sufficient discussion about was presented by M. Gregg Bloche, MD, JD, Professor at Georgetown University Law School and Visiting Fellow at the Brookings Institution. Professor Bloche highlighted the very troubling issue surrounding the role of doctors in interrogation, focusing on Iraq and Guantanamo. What is particularly disturbing is the extent to which the rules defining the boundaries of human torture have been recently interpreted at the highest levels in the United States and the assumption that military physicians can monitor the interrogation process – and even that ethics do not need to apply under the assumption that the physician who assists in interrogation isn't acting as a doctor and thus is not bound by medical ethics!

We have learned so painfully from our past how dangerous it is – to medicine and society – when physicians cross the lines of medical ethics on behalf of war and war crimes. That such serious violations of human trust are being repeated today is horrifying. I would

encourage all of us to become more familiar with this topic. Professor Bloche provided an Op-Ed on this topic entitled “*Doing Unto Others as They Did Unto Us*” in the November 14, 2005 issue of the New York Times that is worth reading (<http://www.brookings.edu/views/op-ed/20051114bloche.htm>). From my perspective it is not possible or appropriate to expect that physicians can separate ethics from human suffering in matters of human torture. While we can all appreciate the impact of terrorism in its modern forms and our desire to stem or eliminate it, it is important that we don’t cross the line of humanity in doing so. I fear that has been happening and that we will learn more about this sad chapter in our history in the not too distant future. Regardless, we must do all we can to protect the important role of the physician in society and our commitment to be responsible leaders for human health and well-being.

Upcoming Accreditation Visit

From December 6-9th the Association for the Accreditation of Human Research Protection Programs (AAHRPP) will conduct a site visit to review Stanford’s programs. These encompass the University and affiliated Hospitals (including Stanford Hospital and Clinics (SHC), Lucile Packard Children’s Hospital (LPCH), Veterans Affairs Palo Alto Health Care Services (VAPAHCS) and the Palo Alto Institute for Research and Education (PAIRE)). Under the leadership of Dr. Artie Bienenstock, Vice Provost and Dean of Research and Graduate Policy, Stanford is seeking accreditation from the AAHRPP as evidence of its commitment to excellence in clinical research and patient protection – an issue that has assumed increased importance for the public in recent years.

According to Dr. Ann Arvin, Associate Dean of Research, considerable preparation has already occurred through our institutional self-assessment study, which addressed the large number of requirements and expectations from the AAHRPP having to do with clinical protocol performance, Institutional Review Board and related activities – all focusing on how we protect human research participants.

During their site visit, the team will meet with protocol directors, study coordinators, IRB chairs, faculty members and staff as well various institutional leaders. They will also conduct audits of active protocol files. The inspection findings will then be reviewed by the AAHRPP Council to determine whether Stanford has fulfilled the requirements for accreditation. To date 24 institutions have fulfilled the AAHRPP requirements for accreditation – and we need to do all we can to support Stanford’s inclusion in the list of universities accredited by AAHRPP. Obviously more details will follow.

Appointment of Daria Mochly-Rosen as Senior Associate Dean for Research

I am extremely pleased to announce that Dr. Daria Mochly-Rosen, George D. Smith Professor in Translational Medicine and Professor, by courtesy, of Neurosurgery, has accepted my invitation to serve as Senior Dean for Research. In this capacity Dr. Mochly-Rosen will work closely with Dr. Harry Greenberg to oversee the School’s broad mission in basic and clinical research and the important relationships between them that surround our mission in “Translating Discoveries.”

Dr. Mochly-Rosen has had a very distinguished career in science and medicine. Following the completion of her PhD at the Weizmann Institute she joined the Koshland Laboratory at UC-Berkeley for postdoctoral training. She then joined the faculty at UCSF in Neurology and the Program in Biological Sciences. She came to Stanford in 1993 as an Associate Professor of Molecular Pharmacology. Dr. Mochly-Rosen also served as the Reed-Hodgson Professor of Human Biology from 1996-2001, when she was named chair of the Department of Molecular Pharmacology. Her laboratory has focused on the mechanism of protein kinase C-mediated signal transduction in various disease models. She hypothesized that activated PKC isozymes bind differentially to receptors at different subcellular sites in a concentration-dependent, saturable and specific manner as “receptors of activated C-kinase” or RACKs.” Based on this and related work she and her colleagues identified novel isozyme-selective inhibitors that have specific functional impacts on normal and diseased states. She has furthered this work through a collaboration with Kai Pharmaceuticals (where she worked during an administrative leave from Stanford) to the point where at least one novel agent is now in clinical trials for heart failure. This is an exceptional example of translational research emanating from Dr. Mochly-Rosen’s basic research to a potential disease application and now an ongoing clinical trial.

Dr. Mochly-Rosen will continue to remain an active and vibrant faculty member but will commit a portion of her time to the role of Senior Associate Dean for Research. In that capacity she will serve as an important liaison with our basic science faculty, championing the important role that Stanford will continue to play in basic science research, while also working collaboratively with Dr. Greenberg to foster connections between basic and clinical science faculty. She will have specific oversight over our very important research cores and will also work to support the mission of the Stanford Institutes of Medicine, in tandem with our departments, in fostering “Translating Discoveries.”

Dr. Mochly-Rosen succeeds Dr. John Boothroyd, but unlike John she will not have oversight over graduate students and postdoctoral fellows in her portfolio. We will be seeking an additional individual to oversee those critically important missions. As she assumes her new role, Dr. Mochly-Rosen will step down as chair of Molecular Pharmacology.

I am very pleased by Dr. Mochly-Rosen’s decision to serve as our Senior Associate Dean of Research in partnership with Dr. Harry Greenberg. Please join me in welcoming her to her new leadership position in the School of Medicine.

Transitions in the Dean’s Office

On November 17th Mike Hindery communicated his decision to step down from his position as Senior Associate Dean for Finance and Administration after ten very productive years at Stanford in this very challenging and demanding role. I want to thank Mike for his tremendous commitment, diligence, hard work and dedication to the School of Medicine, the Medical Center and University. Mike served Stanford during a decade

of tremendous change and challenge - spanning the spiral of the merger and de-merger to our more recent trajectory toward "Translating Discoveries." He has contributed to virtually every facet of our missions and I am very grateful for all that he has accomplished. I will miss him but I also understand his desire to pursue new opportunities and different challenges. I hope you will all join with me in thanking him for his many important accomplishments and to wish him well in his new endeavors.

I will soon begin a search for the next Senior Associate Dean of Finance and Administration (a position that I view as comparable to the role of a Chief Operating Officer) and hope to have that process completed by next spring. In the interim I am very pleased that Ms. Marcia Cohen, our CFO and Assistant Dean for Fiscal Affairs, has agreed to serve as the interim Senior Associate Dean for Finance and Administration. Since she joined Stanford Marcia has performed in a splendid manner and I am grateful that she is willing to assume these additional important responsibilities for the challenging period ahead. I have every confidence in Marcia and ask for you to work with her - and of course to support her - during the months ahead. Mike Hindery will officially leave at the end of January 2006 and in the interim he will work on special projects. But in order to make the transition as smooth and as well informed as possible, we have agreed that Marcia will begin her new responsibilities immediately - with Mike serving as a consultant and advisor during the transition period.

I recognize that change is always filled with challenges as well as opportunities - for institutions as well as individuals. I look forward to continuing to work with you on behalf of Stanford Medicine and have every confidence that we will continue to make great strides in our quest to be a true leader among academic medical centers.

Awards and Honors

Richard Olshen, Professor of Health Research & Policy (Biostatistics) and, by courtesy, of Electrical Engineering and Statistics, has been elected a Fellow of the IEEE (Institute of Electrical and Electronic Engineers). It is unusual for a statistician to be elected to the IEEE, and we recognize that this honor is a tribute to the scope of his achievements. Kudos to Richard Olshen!

Appointments and Promotions

- **Alejandro Sweet-Cordero** has been appointed to Assistant Professor of Pediatrics (Cancer Biology), effective 12/01/05.
- **Albert Wong** has been appointed to Professor of Neurosurgery, effective 12/01/05.
- **Anton Wyss-Coray** has been promoted to Associate Professor (Research) of Neurology and Neurological Sciences, effective 12/01/05.

Dean's Newsletter

December 12, 2005

Where Are We?

The adage that it is sometimes easy to lose sight of the forest for the trees has particular relevance when institutions are changing on multiple fronts simultaneously. Certainly that is true of the School of Medicine. Four years ago, in January 2002, we launched our multifaceted strategic plan entitled “*Translating Discoveries*.” As many of you will recall, the plan was purposefully broad and included our missions in education, research and patient care as well as the mechanisms by which we could support and enhance them. So where are we now – and how do all the moving parts fit together? And, of course, what does this all mean for individual faculty members, students and staff?

Over these past four years we have initiated a New Curriculum for Medical Student Education, made changes and refinements in Graduate Education (including the Masters in Medicine Program highlighted below) and have begun to focus on resident and postdoctoral training. Each of these changes is aimed at enhancing the importance of scholarship, research and leadership in our students and trainees and in graduating students and postdocs who are more likely than in previous years to seek roles in academia. While a number of significant changes have been made, our education programs remain very much a work in progress. Additional developments as well as the fruits of programs already initiated will be better defined during the next several years. Hopefully our efforts will be measured by increased numbers of students pursuing research and scholarship.

At Stanford we are most fortunate in having outstanding basic research programs. Certainly sustaining and enhancing this essential component of our School are central to our future success as an academic medical center and university. At the same time we have put considerable effort into seeking ways of bringing knowledge from the research laboratory to the patient. These efforts include funding translational research pilot programs in conjunction with the Beckman Center, developing such underpinning programs as our new joint department of Bioengineering and related programs in BioX, and developing our Stanford Institutes of Medicine and the Stanford Comprehensive Cancer Center. Each of these programs has been designed to bring together communities of basic and clinical scientists from the medical school – and from throughout the university – to address new problems and opportunities, especially when they could have an impact on human health.

As might be expected at this point in their gestation, each institute is developing on its own trajectory, which includes creating new intersections with departments, other institutes and other schools. While they are best viewed as still being in an early stage of development, it is clear to me that progress is being made – although much work remains to be done. That said, the Institute for Stem Cell Biology and Regenerative Medicine has made some excellent recruitments in conjunction with clinical and basic science departments. It has also developed an outstanding training program that will surely be

funded by the California Institute of Regenerative Medicine as soon as the legal hurdles impeding bond issuance are resolved (which will likely happen over the next 6-8 months). Equally important, the leadership of the Stanford Comprehensive Cancer Center has made tremendous progress and will be submitting their proposal to the NCI in February – a monumental achievement in its own right.

In addition to our institutes we are making progress with our integrating Strategic Centers in Genomics and Human Genetics, Imaging, and Informatics and envision further progress in the early part of 2006. Together with the underpinning programs in Bioengineering, BioX and BioDesign, an integrated matrix to shape our research agenda for the next decade is emerging. While at the end of the day it is faculty – working alone or in teams – who are ultimately responsible for the research agenda, it seems clear that having overarching themes will best enable us to align our efforts and in particular to be competitive for NIH funding. This funding is surely going to be more restricted and proscribed as funding is constrained and as both politics and, most likely, the NIH reauthorization direct additional research dollars into more applied funding – which thankfully includes translational research.

To further prepare for our efforts in translational research, the School and clinical departments – as well as Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) – have been working on the infrastructure to support a more expanded effort in clinical and translational research. The recent launch of SPCTRM (Stanford/Packard Center for Translational Medicine) and supporting databases will help with this effort. So too will our efforts in developing the Stanford Comprehensive Cancer Center and its related cores, along with other core support services centers. Hopefully these programs will be even further enhanced when we are successful in receiving funding for our proposed Center for Translational Research. In addition, Stanford's very successful General Clinical Research Center (GCRC) program adds further substance to these efforts; we hope to extend these through an application in 2006 for an NIH-supported Clinical and Translational Science Award (CTSA). Taken together these and related programs should help to further enable our faculty and students to conduct cutting edge clinical and translational research.

We have also spent considerable time linking our education and research programs to patient care activities, innovations and improvements at SHC and LPCH. Our major strength lies in bringing innovative therapies, based on research, to clinical programs. Accordingly, both SHC and LPCH have developed clinical strategic centers that are aligned with our Stanford Institutes of Medicine and the Comprehensive Cancer Center. This is permitting us to define and delineate areas of need and development and has played a major role in faculty recruitments during the past four years. And, without question, clinical faculty performance has played a dominant role in helping both SHC and LPCH to become financially successful. We are furthering these alignments and integration between the School and Hospitals by coordinated planning around our key initiatives as well as by the financial support that is provided or shared, as is the case with the new “funds flow model” with SHC that went into effect this past September.

Another critical component of our future success is enhancing leadership. We have been fortunate in recruiting some outstanding clinical chairs – and faculty - during the past several years including Drs. Rob Jackler (Head & Neck Surgery – Otolaryngology), Bill Maloney (Orthopedics), Frank Longo (who joins Stanford as chair of Neurology in January 2006), and Jonathan Berek (who will become chair of Obstetrics/Gynecology also in January 2006). We also have searches underway for the next chairs of Medicine and Pediatrics and hope to fill these critically important positions in the first quarter of 2006. These new clinical leaders, in conjunction with our already existing group of clinical chairs, are making a major difference in improving patient care and in the effectiveness of the interface of patient care with research and training.

A key to the success of our programs is not only defining their direction and the ways of enhancing and integrating them, but also supporting them through program development as well as administrative and financial support. Accordingly, we have redone the funds flow formulas that define the “Operating Budget” within the School and the “funds flow model” between SHC and the School, to better align and support key programs. We have also redone the funds flow model with the University and are now in the midst of assessing our financial forecast during the next decade so that we can do everything possible to optimally support our programs in a manner most consonant with our strategic directions in education, research and patient care.

Perhaps one of the most important supports that we need going forward is new and additional space for education, research and patient care. Accordingly the School as well as SHC and LPCH have worked individually on long-term facilities plans (over a 20 year horizon) as well as collectively on a medical center wide integrated facilities plan. These efforts have helped define each of our needs and priorities, how one relates to another, and how we will support them financially as well as operationally, tactically and politically. As you know we are now in the midst of architect competition for the Learning and Knowledge Center (LKC) and expect to choose the winner in January – with the hope and goal of ground breaking in 2007 and completion of this facility in 2009. We are also doing program planning for the Stanford Institutes of Medicine Building #1 which will house faculty in the Comprehensive Cancer Center, Institute for Stem Cell Biology and Regenerative Medicine and the Neuroscience Institute. All of these faculty will also have departmental appointments and thus will enhance both departmental and institute development. In tandem with our master facilities plan on the campus we have also leased space off-site and are in the midst of exploring additional lease space to support departmental research programs during the next decade. Given our current space shortages, these explorations are critical to our short and long-term success.

Another key area of support that will surely define our future is the use of information technology and its role in education, knowledge management, research – including clinical research – and of course, patient care. This is a rapidly moving and expensive area and our investments require orchestration and integration. Here too we have attempted to facilitate this through senior leadership within the school and departments – as well as at the hospitals and the university.

We are also supporting our program development by better definition of the roles and expectations of faculty. A key component is our strong desire to help make every one of our faculty successful. I am cognizant of how challenging life in academic medicine (as well as medicine in general) has become. While there are some things we cannot change, we certainly want to do all that we can to improve the quality of life of faculty. We are also seeking ways to enhance the diversity of our faculty, staff and students – and have established an office and senior leadership to facilitate this. This is an important issue in its own right and one that will require commitment over many years to come.

Achieving our goals and objectives requires understanding and support by the communities we serve. Accordingly we have put considerable effort into improving our communications and public relations services, including the materials we produce as well as our interface with the local and national media. Given the array of issues and challenges we face there are always going to be some controversial issues– but I think we have made progress in improving the Stanford image. I also believe it is important for us to take responsibility and leadership in speaking out on some of the major issues facing medicine, science and society. And, at the end of the day, we need to be seen as a resource for the community – and as a place that community members can turn to for guidance and information. Building that type of image is also a work in progress.

Having a more clearly defined vision and set of goals has been the foundation of our strategic planning and implementation activities over the past several years. A bold vision surrounding translating discoveries and a plan for achieving this vision through our education programs and research efforts - including the Stanford Institutes of Medicine and their relation to the clinical centers at SHC and LPCH - offer our best hope for obtaining the resources needed to bring these ideas to life and to sustain them. As you know, this is all directed to the capital campaign that we are now initiating. We hope that, in conjunction with partners across the medical center and university, we will be successful in the campaign and, of course, in our ultimate goal of improving health.

Clearly each of these efforts is at a different stage of development and, depending on where one is, it is easy to lose sight of the forest for the trees. It is also easy for any individual to become frustrated since the plans at hand may not be influencing his or her life or program at the moment. I understand that, and I also recognize that frustration can arise during periods of dynamic change. And of course I also appreciate that change can be uncomfortable for some – depending on one's personality and relative level of comfort with the status quo. But we cannot be satisfied with the world as it currently exists and must continue to prepare for a world of continued change in which, I hope, we can be leaders. That is where we are now – and obviously we have still a long way to go. I know that I have asked on many occasions to get feedback from you regarding your own assessments and reactions to our current world – and the one we hope to shape. Here I have tried to give you an institutional perspective on where we are (and, to an extent, on where we have come from during the past several years). But I am also eager to learn more about where you are. Let me know.

Striking Out

Beginning at 5 AM this morning, December 12th, the Service Employees International Union (SEIU) Local 715 launched a one-day strike at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. The union represents 1,412 out of 8,432 employees at the hospitals. These positions include hospital support employees in jobs such as housekeeping, food service, nursing assistants, and certain technicians. In order to be prepared, both hospitals have been contingency planning to ensure that if any form of work stoppage occurred, both hospitals could continue normal operations. In tandem, SEIU Local 715 University Employees, under a different contract, also went on a one-day strike on December 12th. These include technical, service and maintenance workers, a number of who are employed by the School of Medicine.

The Hospitals have presented a fair and competitive offer to the SEIU for the benefit of their employees represented by the SEIU. The offer is responsive to the needs identified by the SEIU-represented employees and addresses wage increases, health insurance/retirement/ and educational enhancements and other benefits. Both hospitals have emphasized that they value the contributions made by their SEIU-represented employees to the missions of each organization. They are prepared to return to the bargaining table when the SEIU makes a meaningful written response to the offer that LPCH and SHC put on the table some two weeks ago. Similarly, the University is bargaining in good faith with SEIU and remains convinced that it is among the most progressive employers and that it is committed to helping employees care for their families and prepare for a better future.

Recognizing Our Dedicated Staff

On Tuesday evening, November 29th the Annual Dean's Staff Recognition Dinner was held in the Faculty Club to honor employees who have been part of the School of Medicine for five or more years. This year we recognized 341 honorees, 61 (17.8%) of who have been members of our Stanford community for 20 or more years. The commitment and dedication of our employees are deeply appreciated. Indeed, without the quality and high-level performance of our wonderful staff, we simply could not achieve excellence as a leading research-intensive School of Medicine. I want to thank this year's honorees as well as the other 3,500 members of the medical school for all that they do on our behalf.

As in past years, two exceptional members of our staff were selected by their co-workers to receive the School's Employee of the Year Spirit Award. Robin Brown from the Department of Radiation Oncology and Brenda Lavell from the Department of Medicine (Division of General Internal Medicine) were named the 2005 Spirit Awardees, and I want to offer my special congratulations to them. You can read more about these awardees at <http://news-service.stanford.edu/news/2005/november30/med-spirit-113005.html>.

While thanking each of our employees for the efforts, I think it is appropriate to specifically mention those who have served the School for 20 or more years. Among this group 12 have been employees for 30 or more years and one for 40 years! That is remarkable dedication. These individuals include:

The Respectful Workplace Goes Awry

Unfortunately at the Staff Recognition Dinner described above, an incident occurred which was most surprising and which many in the audience and I found deeply troubling. Because this was such an infraction of the spirit of our respectful workplace – and indeed the very purpose of the event itself - I feel compelled to relay it to you.

One of the members of our faculty, Dr. Jared Tinklenberg, Professor of Psychiatry and Behavioral Sciences at the VA, in lauding the efforts of an honoree, used a phrase and a description about the honoree that was offensive to the audience and me. Statements of this kind made by Stanford faculty (or indeed any leader in our community) are inappropriate at a Stanford sponsored event. I met with Dr. Tinklenberg following the event and informed him of my strong feelings about his actions. He has assured me that he regrets making the statements and that he will not make such statements again. Dr. Tinklenberg is aware that I am making this public statement in the Dean's Newsletter as a reminder of how important I believe it is to have a "respectful workplace."

I should add that immediately after the incident, Dr. Tinklenberg realized he had offended the audience and he apologized to the honoree. Dr. Tinklenberg also sent Cori Bossenberry, Director of Human Resources, and me written apologies for his

actions. He apologizes to all who attended and heard his comments – and wishes me to convey that as part of this message.

I believe that comments like those made by Dr. Tinklenberg, even if stated privately between two people, should not occur in the workplace. Often, even if one of the parties says they don't mind, they may have become inured to the longstanding "joke" or simply be resigned to the fact that that is "just the way it is here." As Dean of the Medical School, I am personally committed to a workplace where all are treated with respect and each member of our community feels that the School will afford them a safe and dignified environment in which to work and learn.

If you have any comments or questions, please contact either Cori Bossenberry or me.

Thanking Perry Everett

On Thursday evening December 1st the School held its farewell to honor (really roast) Perry Everett who retires on January 13, 2006 as Controller of the School of Medicine. Perry has been a member of the University community for 29 years and has made consistent and exceptional contributions. As those who know Perry will readily acknowledge, he is a truly unique and multi-talented individual. Despite his characteristic (and much admired) direct style, Perry has many soft sides. He is deeply dedicated to the School and its employees and is a great public citizen, world traveler, multi-linguist, chocolatier, Hawaiian shirt scholar, and much more. I have attended many farewell events in the past few years and while each evokes deep support for the honoree, none was as well attended or as ebullient as Perry's farewell fest. People came from far and wide to bid Perry a fond farewell and express their thanks (and not because they were glad he was leaving) for his tremendous and enduring contributions. Regardless of what position he has held, Perry is hard to replace. We will all miss him – and I want to add my personal thanks for his remarkable dedication and exceptional work and support.

Appointment of Dr. Jim Ferrell as Chair of MCP

I am very pleased to announce that Dr. James Ferrell will be the next Chair of the Department of Molecular Pharmacology, succeeding Dr. Daria Mochly-Rosen, who has been appointed Senior Associate Dean for Research. Jim Ferrell is an MD-PhD graduate of Stanford whose research centers on the signal transduction pathways that trigger *Xenopus* oocyte maturation. His research addresses fundamental issues in understanding fertility and reproduction as well as numerous other biological systems. He and his colleagues are leaders in computational biology. Jim has served as Associate Chair and Interim Chair of the Department and is highly respected by his colleagues in the Department and throughout the School. He is a superb educator – and also a musician (favoring his rock band as a venue). I am very pleased that Jim has accepted this important role and look forward to working with him and his colleagues in the years ahead.

Thanks to Ben Barres for His Leadership in Education

I want to thank Ben Barres, Professor of Neurobiology and of Developmental Biology and of Neurology and Neurological Sciences, for his leadership and tremendous efforts in

successfully establishing the new degree of Masters of Science in Medicine that was approved by the Faculty Senate of the Academic Council on December 1st. I also want to acknowledge the support that Dr. Barres received from Dr. Ellen Porzig, Associate Dean for Graduate Education, which enabled the proposal for this new program to be so successfully received. This new program will help train leaders in translational medicine by focusing on students who have already been admitted to an existing PhD program at Stanford. This will be a rigorous two-year program based on existing courses that will more directly expose PhD graduate students to the challenges of clinical medicine – and the importance of translational research. When fully operational the Masters of Science in Medicine program will accommodate 10 students per year, but it will be launched on a smaller level contingent on program funding. This is an exciting new program that complements the recent major revisions in the MD curriculum and that further supports our overarching efforts in “*Translating Discoveries*.” Additional information about this exciting new program is available at: <http://news-service.stanford.edu/news/2005/december7/med-degree-120705.html>.

Update from the Career Center

One of our important initiatives of the past two years was the establishment of the Stanford School of Medicine Career Center under the Directorship of Michael Alvarez. The Center is dedicated to the development of career-related resources and programs for our extended community of biomedical trainees. The goal has been to offer support for well-informed career decision-making that enhances the successful career development of our trainees, including MS, PhD, MD students, Postdoctoral Scholars, Residents and Alumni.

In collaboration with Schools, Departments, and Programs across the University as well as with external partners, the Career Center coordinates seminars and information sessions to raise awareness about the full range of career options and opportunities available to our research and clinical trainees. For example, this fall the Career Center partnered with the Medical Center Alumni Association to host the Neuroscience Symposium and an Alumni Career Networking Luncheon. The event brought both current and former trainees from research and clinical backgrounds together in a common environment to discuss career interests. It stimulated dialogue among members of various disciplines, helped to dissolve perceived barriers between the groups, and fostered a shared sense of community.

A new resource that was recently launched is the School of Medicine Career Center Job Posting email distribution list. This enables employers to send information about academic, research, clinical, government, non-profit, and consulting position openings directly and exclusively to the Career Center, where they are gathered and packaged for targeted distribution twice monthly to all who subscribe (participation requires Stanford affiliation). Nearly 200 of our trainees have already subscribed for this service and the number of employers and job opportunities grows each week. The Center anticipates that within the next year it will have a robust system with over 300 participating employers and several hundred trainees and alumni.

The Career Center is also pleased to introduce an exciting School of Medicine Career Center initiative just under way - the development of a formal Career Advisory Network (CAN), providing current trainees with more direct access to alumni for information about career pathways they have traveled. Through this web-based system, alumni who decide to participate will be able to connect with one another and/or consult with current students regarding career opportunities, considerations, and experiences. For further information about how to participate in CAN, please contact the Career Center at somcareers@stanford.edu.

For additional information about the Career Center and the resources and materials that are available online, see: <http://med.stanford.edu/careercenter>, or feel to visit the Career Center office in CCSR 4245.

Office of Diversity and Leadership Community Networking Groups

Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership, has let me know that, as part of the implementation of the strategic plan for her Office, she is launching a community networking initiative. This initiative is aimed at bringing faculty together in informal settings to exchange information, support one another, and build community. The topics and activities of the networking groups will be determined by the groups themselves, but may include such issues as the challenges of dual career families, single parenting, day care, and other realities of the busy lives that faculty lead.

Faculty interested in discussing these challenges and in meeting other colleagues who have similar interests and dilemmas should contact Barb Miller, Associate Director of Diversity and Leadership at 5-8402 or bemiller@stanford.edu. In your communication, please let her know what issues are most pressing for you and what time of day would be most convenient for you to meet (such as breakfast, lunch, or late afternoon).

I encourage interested faculty to take advantage of this opportunity to come together with other faculty with similar interests and concerns.

Appointments & Promotions

Kwabena Boahen has been appointed to Associate Professor of Bioengineering effective 12/16/05.

Dean's Newsletter January 9, 2006

A New Year Begins

A new year always seems to offer a sense of renewal and opportunity – both for individuals and for institutions. Since my first January at Stanford, in 2002, we have used

this time to plan for the future and have used the annual “Leadership Retreat” as an opportunity to focus our collective energies on our major goals and objectives. When we originally configured our overarching School of Medicine plan of ***Translating Discoveries*** in 2002, our attention was directed toward developing the programs in education, research and patient care that would serve as the cornerstones of our future efforts. Since then we have made considerable progress in implementing various aspects of our strategic plan – but we still have a long way to go, especially in our need for the facilities to house and support many of our important education, research and clinical activities. Thus, as we begin this New Year, my primary goal and challenge are to continue to find and develop the resources that will enable us to accomplish our collective aspirations.

In doing so, I fully recognize that each of us has our own hopes and aspirations and that, while we may be happy to support broader initiatives, we also want to know that our own needs are being met. This is true for individuals, departments, institutes and beyond. The challenge is how do we accomplish this in the most successful manner and in a way that allows “all the boats to float upwards with the rising tide.” As I have said previously, I am well aware that when institutional priorities are crafted, a double-edged sword is created. On the one hand, making priorities clear and well defined allows for focus and the opportunity to delineate a bold and integrated message. However, such a focus can also create a sense of being left out or even worse, a feeling of being undervalued on the part of those who do not seem to find themselves on the “priority list.” The challenge is to prioritize and integrate while also being inclusive.

One of the most important areas in which this prioritization and integration is taking place is in our efforts to develop an integrated fund-raising plan. This plan will include the School and Stanford Hospital & Clinics (SHC) and, in parallel, the School and the Lucile Packard Children’s Hospital (LPCH). At the Fifth Annual Leadership Retreat since my arrival at Stanford, scheduled for January 26-28, we will have a broad discussion of how this plan is evolving and how the department chairs, institute directors, center leaders and others can help bring it to fruition.

In our integrated development plan, we have established the following overarching priorities with the understanding that a very significant proportion of our efforts within the school will benefit from fundraising successes in these areas. For each of these areas we will be seeking philanthropic support for facilities and program development. They include:

- ***The Stanford Cardiovascular Institute and its related clinical programs at SHC and LPCH***
- ***The Stanford Institute for Immunity, Transplantation and Infection and its related clinical programs at SHC and LPCH***
- ***The Stanford Neuroscience Institute and its related clinical programs at SHC and LPCH***
- ***The Stanford Institute for Regenerative Medicine and its relationship to other Institutes, academic programs and clinical programs***

- *The Stanford Comprehensive Cancer Center*
- *Medical and Biomedical Education*
- *Orthopedic Surgery and Sports Medicine*
- *Bioengineering (in conjunction with the School of Engineering)*

While on the surface these priorities may appear to represent only a selective portion of the school and our faculty, they are indeed quite broad-based. We know from prior analyses that over 85% of the faculty's programs can be encompassed within one or more of these collective areas. We have set ambitious goals but, with a clearly defined vision and message, I am confident that we will be successful. Perhaps more accurately, I intend to increase my personal commitments even more toward making these efforts successful. That said, I will also be counting on faculty and school leaders to help in the important effort to garner resources that will allow us to "translate discoveries" and truly make Stanford an even more successful academic medical center.

Facilities Planning for the School of Medicine – an Update

During the past several years I have shared with you the various issues and challenges we face in delineating the School of Medicine's Facilities Master Plan. An important aspect of the plan has been to develop the medical school campus in a manner that continues the close proximity and integration between the basic and clinical sciences, between the school and the university, and between the school and the affiliated hospitals. There are many challenges to maintaining and even enhancing this continuity, which was first achieved when the School of Medicine moved to the Stanford campus in 1959. However if we are to sustain our uniqueness and excellence, every effort must be made to also sustain the special contiguities that have characterized Stanford Medicine for nearly half a century.

The need to address the education and library facilities was one of my immediate mandates when I arrived as Dean in April 2001. Thanks to the efforts of key school leaders and many faculty, students and staff, we have made considerable progress in defining the future of medical and graduate student education. We have also configured an exciting digital library plan that culminated in the most recent proposal for the Learning and Knowledge Center (LKC). The LKC is comprised of a new 120,000 gasf (gross available square feet) building on the site of the Fairchild Auditorium and extensive renovations in the Lane and Alway buildings. Together these will define a comprehensive and integrated state-of-the-art, leading edge education and knowledge facility. As you know from prior Dean's Newsletters, we received "Site and Concept" approval from the Stanford University Board of Trustees on October 11th for the Learning and Knowledge Center (LKC). This approval enabled us to make a highly successful presentation to the Liaison Committee on Medical Education (LCME), which accredits all U.S. medical schools, during their October 16-19 site visit. We will be selecting the lead architect for the LKC later in January; we anticipate a design phase this year and ground breaking in 2007. We currently foresee opening the LKC in 2009 in conjunction with the celebration of the Fiftieth Anniversary of the School's move from San Francisco to the Stanford Campus.

In addition to the LKC, we are planning other onsite facilities construction and renovation projects. Foremost among these is Stanford Institutes of Medicine #1 (SIM1), which will be a 200,000-gasf-research building housed on the parking lot south of CCSR. SIM1 is also slated for completion in 2009/2010. In addition to providing research space for faculty associated with the Stanford Institute for Stem Cell Biology and Regenerative Medicine, the Stanford Comprehensive Cancer Center and the Neuroscience Institute at Stanford (all of whom will have departmental appointments as well as Institute affiliations) SIM1 will also permit a much needed expansion of the Research Animal Facility (RAF). Thus SIM1 will provide opportunities for faculty affiliated with both the Institutes of Medicine and School of Medicine departments.

In tandem with new facility planning, we are also actively exploring much needed infrastructure renovations of the 1959 facility (aka the GALE complex) that will allow us to update wet and dry laboratories and related administrative space. Because these facilities are of critical importance to our immediate future, these renovations are also expected to occur during the next several years. Further, we will soon begin the planning for SIM2 with the hope that this facility can come on line between 2010 and 2015.

While my major goal remains developing research and education facilities that are closely linked to the current medical school, medical center and university campus, we are also developing off-site plans, some interim and some potentially more permanent. We have leased the 1050 Arastradero facility, a 70,000-gasf research building, which will house portions of the Regenerative Medicine and the Neurosciences Institutes until SIM1 is completed. This facility is currently being renovated, although portions of it are being occupied now. In addition, the Pathology Department has relocated the Blood Center, as well as several important research laboratory programs, to Hillview Avenue in the Stanford Research Park near the VA complex. We also continue to lease space on California Avenue for the Genomics Centers and other off-site space for animal facilities. We are also seeking additional research space to help various departments and will soon decide on the site and development plans for that site.

All told, you can see that we have significant plans for renewing and redeveloping our medical school facilities. One of the additional and very important benefits this planning offers is the opportunity to develop a far more integrated School of Medicine campus that would more optimally align the school to both our affiliated hospitals and the university. Highly relevant to these goals are the plans for the Science and Engineering Quad 2 (SEQ2) that are currently under development. SEQ2 will house a new Energy and Environment Building along with engineering facilities, including a new Bioengineering Building, which relates to the Department of Bioengineering, a joint department of the Schools of Engineering and Medicine. It will connect to the School of Medicine by a walking mall along what is now Via Ortega. In addition, both Stanford Hospital & Clinics and the Lucile Packard Children's Hospital are planning revitalization and renovation projects that will offer additional opportunities to develop a more integrated medical center campus. Without question, the Stanford Medical School of 2015 – and the Medical Center and University – will have a more integrated, exciting and up-to-date

functionality than it does today. Your roles as stewards and leaders of this transformation will be important – and of course, much appreciated.

Needless to say, financing these facilities will be an important and significant challenge. This challenge is one of the reasons why I have felt so strongly the need to craft a development plan that is focused – but also bold and far-reaching. As noted above, considerable time and energy – certainly on my part – but also from other members of our community will be needed to meet our goals. Over the past 2-3 months we have worked on a 10-year financial forecast for the school that has enabled us to develop a funding plan that uses school and university resources along with philanthropy to fund these projects. There is no denying that this will be a challenge to achieve – but I do believe we can and will be successful. Our ultimate success depends to a great degree on our mutual and shared investment in each other and the future of the school. I believe we have an opportunity to further propel Stanford in the very highest echelons of research-intensive schools of medicine. But to do so it will necessary for each of us – students, faculty, departments, institutes and school – to be aligned and to share in shaping a future of true success.

The Infrastructure Charge and An Attempt to Provide Some Mitigation

During the past couple of months department chairs and faculty have raised a number of concerns about the impact of new infrastructure charges that went into effect on September 1, 2005. These new charges, which were put in place by the university, were having a negative effect on training fellowships and related grants, particularly those available for fellows and junior faculty. In response to these concerns, I have been working with Marcia Cohen, Acting Senior Associate Dean for Finance and Administration, and Doug Stewart, Associate Vice President, Office of Medical Development, to determine what options the school might have. As important as the infrastructure charges may be – and I believe they are important - they are having a number of unintended consequences. It was our goal to mitigate some of these consequences as much as possible.

As a result of our deliberations, we have decided that the Dean's Office will provide the funding for the infrastructure charges on expendable gifts and grants (including fellowships) from foundations and associations that provide written confirmation of their policy not to pay indirect overhead costs. This policy change was communicated to the School's Executive Committee on January 6th. However, when it is determined that the sponsor will pay indirect costs, the infrastructure charges will need to be funded from the sponsor/donor or another departmental source. The Dean's office will only cover the costs when there is written confirmation that the foundation or association does not pay indirect charges.

I should add that in accepting these fellowships and grants we are incurring real costs - but I believe that it is worth doing so in order to support trainees and junior faculty. We estimate that this change in policy will cost the Dean's Office approximately \$1M in 2006 and likely nearly twice that in 2007. Clearly this will have consequences in our ability to provide funding to other important areas or needs.

The Research Management Group (RMG) and the Office of Medical Development (OMD), in conjunction with the Office of Sponsored Research, will work with faculty who are submitting grant proposals or accepting donations and awards to ascertain whether the sponsor will pay indirect costs. Again, in cases where it is determined that the foundation or sponsor will pay indirect costs, the infrastructure charges (or sponsored project indirects, as appropriate to the type of funding) should be funded from the sponsor/donor funds (or another departmental source).

I hope that this plan, which we have made retroactive to September 1, 2005 (the date the new university policy went into effect), will be of help to you, your students/fellows and faculty. We will re-evaluate this plan in three years.

Welcome to Our New Chairs

I am very pleased to officially welcome Drs. Jonathan Berek, who is joining Stanford this month as our new Chair of Obstetrics and Gynecology, and Dr. Frank Longo, who commences his leadership role as our new Chair of Neurology. It is wonderful to include these two new leaders in our Stanford Medicine community.

I also want you to know that the searches for the next Chairs of Medicine and of Pediatrics are actively underway. Candidates for both positions began visiting Stanford and will continue to do so during the weeks ahead. I hope by late spring to early summer we will be able to announce the new Chairs of Medicine and Pediatrics.

Awards and Honors

Richard Myers, PhD (Director of the Stanford Human Genome Center) recently delivered the commencement address at his alma matter, University of Alabama, Tuscaloosa. Myers captivated the audience with his description of advances in the field of genetics that are leading to the development of personalized medicine. In addition, Dr. Myers received an Honorary Doctorate in Humane Letters from the University of Alabama. Congratulations to Dr. Myers!

Hans Ringertz, MD, Ph.D, (Visiting Professor of Radiology – Pediatrics) has been elected Honorary President of Computer Assisted Radiology and Surgery at the 20th International Congress and Exhibition, sponsored by the Science Council of Japan. Congratulations to Dr. Ringertz!

Atul Butte, MD, Ph.D, (Medicine – SMI) and **Amar Das, MD, Ph.D** (Medicine - SMI) received Research Starter Grants from the Pharmaceutical Research and Manufacturers of America (PhRMA). Considering the organization makes up to three such awards each year nationally, it is remarkable that both of these doctors from Stanford Medical Informatics received the grants in the same year! Hats off to Drs. Butte and Das!

Appointments and Promotions

- **David Cornfield** has been appointed to Professor of Pediatrics (Pulmonary), effective 12/16/05.
- **David Paik** has been appointed to Assistant Professor (Research) or Radiology, effective 01/01/06.
- **John Pringle** has been appointed to Professor of Genetics, effective 12/16/05.

Dean's Newsletter January 23, 2006

The NIH Now and in the Future

On January 17th I attended a rather sobering invitational meeting sponsored by the AAMC (Association of American Medical Colleges). Its purpose was to review and discuss current and future funding scenarios by the National Institutes of Health Deans and university leaders from the more research-intensive schools of medicine attended the meeting along with the AAMC policy staff and leadership. Background information was provided by Sue Quantias, House Labor-HHS-Education Appropriations Subcommittee; Bill Hoagland, Director of Budget and Appropriations, Office of the Senate Majority Leader; and Morton Kondracke, Executive Editor, *Roll Call*, along with the AAMC policy group. The news we heard is challenging at best and, while we would all prefer not to be in this situation, the goal of the meeting was to plan actions we might take to change or at least modify the course of currently unfolding events. I want to share my own perspective and analysis to make you aware of what the current perceptions in DC appear to be and to suggest what we need to do to impact the current situation. Importantly, I am also interested in soliciting suggestions or recommendations from you about this enormously important issue.

I am well aware that many of you are quite concerned about NIH funding and that some of you have already begun to experience challenges and problems. It is ironic that it was just several years ago that we were riding the crest of the NIH doubling, and many individuals and institutions expected those halcyon days to continue for many years to come. Indeed, many of our peer institutions went through a building boom to create significant new laboratory space with the expectation that faculty size and institutional success would grow along with NIH funding. And, of course, I would be remiss if I didn't acknowledge the fact that the NIH budget did double from \$13.7B in 1998 to \$27B in 2003 and that this remarkable increase occurred at a time when many other federal programs were flat-to-reduced in funding. The doubling represented the significant and sustained efforts by a number of congressional champions, along with disease advocacy groups, professional societies and others. However, it also created a number of

expectations, some quite unrealistic. Looked at from a different perspective, except for a very small number of years, the NIH budget has actually increased by an average of about 8% per year since 1960. And, of course, it is because we have had a relatively robust NIH that the United States has been the world leader in biomedical research.

That said, the NIH budget in FY06 (the current fiscal year) is down 0.1% from last year and, when adjusted for inflation, is down 3.1%. It was also down compared to constant dollars by 1.2% in FY05 and by 0.7% in FY04. Moreover, it is widely expected that the President's budget proposal that will come out in February will show the NIH budget to be flat for FY07. While there have been downturns previously (albeit only three times) in the NIH budget, this has not previously occurred for two or more consecutive years – making the current scenario even more concerning. Based on what we heard from the congressional pundits and budget directors, it seems unlikely that relief is in sight. The reasons are multi-factorial and include the federal deficit, which is likely to be in the \$400B range and which is made more difficult by the current tax policy, and the war in Iraq (which appears likely to require an additional supplement of \$50-100B in the months ahead), along with other major calls on discretionary funding.

Although we still have some champions for the NIH, the general perception is that their voices are not being heard and the more general sentiment is that the NIH has had its day in the sun - at a time when other agencies did not – and that the funding should not increase. Some apparently even argue for decreases! It also appears that many of the disease advocacy groups have been quieter in the past 2-3 years than earlier, perhaps becoming a bit more complacent after the efforts to achieve the aforementioned doubling. But more concerning is the view – which we were told was quite prevalent – that the NIH has not fulfilled its promise in delivering breakthroughs or cures as a consequence of the budget doubling. As is obvious to those of us in biomedical science, it is unrealistic to expect that kind of success after such a short time. It is more relevant to examine what has been achieved in improving health outcomes by the NIH funding that occurred for basic research during the past 10-30 or so years. Through that lens the impact on health and wellbeing has been startling – a consequence of both fundamental and applied research. Clearly, in addition to the fiscal constraints we now face, there is also a significant information gap between biomedical scientists and the public and policymakers.

In fact, while it is true that most Americans, when queried, have a positive view toward biomedical research *per se*, most have never heard of the NIH. When congressional staffers were questioned about where NIH funded research was being conducted, nearly 20% thought it was all going on in Bethesda, 40% indicated that the research took place in medical schools and academic medical centers and the remaining 40% said they had no clue! Add to this the fact that over 40% of Americans believe in creationism and the rising tide of anti-science in the nation, as I have discussed in previous Dean's Newsletters (see http://deansnewsletter.stanford.edu/archive/11_14_05.html), and it is obvious that education of the public as well as the congressional staffers and leaders has to be one of our highest priorities – although this must be viewed as a long-term effort.

In addition to the expressed viewpoints that NIH has received its “fair share” of the HHS/Labor budget and that it hasn’t met the expectations of major disease breakthroughs or cures, we heard the sentiment that many in the Congress believe that NIH should not be emphasizing science but rather health. Clearly this misses the point that improvements in health are a dividend of scientific research – often following decades of research investment.

Perhaps ironically, the message that is resonating – in part because of the advocacy of University leaders - is that funding needs to be placed in the physical and engineering sciences if the US is to remain competitive in the global science and technology arenas. Certainly this is true, and there is no doubt that these important areas have been underserved and that without increased support the US will lose its lead – or may already have done so. This message seems to have struck a cord (which is encouraging), and there is an expectation that not insignificant funding (perhaps in the order of \$10B over the next several years) could find its way to the National Science Foundation to help address this important need. And while this deserves our support, an unintended consequence is that biomedical research could be compromised, given the overall fiscal crisis facing the federal government.

Along with these changes in expectation and funding, a prevailing view appears to be that the NIH should be engaged in more translational research, although the definition and indeed understanding of what that means is highly variegated. In addition to the NIH Roadmap efforts, there has been a proposal by Senator Lieberman (D-CT) to set up an organization that would focus specifically on translational medicine and cures – likely funded by money taken from NIH. Hopefully this will not come to pass. But it does seem probable that some facet of the NIH reauthorization could occur during the next congressional session, at least on the House-side, given the strong position and leadership of Congressman Barton. This could also have the effect of moving more dollars into a “common fund” (potentially up to 5%) to support translational research and director initiatives – which could further limit the funds available for investigator-initiated research. And while a number of advisory groups, including the National Academy of Science (NAS) and the Institute of Medicine (IOM), have recognized the importance of strengthening the NIH Director’s authority and creating more interdisciplinary research, these recommendations occurred at a time when a growing NIH budget was envisioned. Given the current situation such tradeoffs would certainly be undesirable.

As distressing as these scenarios are, they also need to be set in a broader context. Looming in the not too distant future is the impact of entitlement programs, especially Medicare, on the federal budget and the impact they could have on overall financial solvency. Coupled with this is the aging population along with the fact that healthcare in the USA is in such disarray. The problems of access, rising costs and the impact on employers are rapidly shifting health care costs to consumers. At the same time many large companies (most recently, General Motors) are facing serious problems leading to significant changes in employee benefits – which will place additional strains on the health care system. And while Americans have not yet accepted the need for fundamental change in health care expectations, this will almost certainly change as they bear

additional costs during the years ahead. As you likely know from prior comments I have made on this topic, I believe radical change is needed to reform (or even develop) a functional and credible health care system in the United States.

Certainly the situation I am describing is sobering and distressing. But it is important to note that even while the forces in play are somewhat different at this point than in the past – and while they are potentially more refractory to facile remedies – it is incumbent on us to find solutions. I noted at the January 17th meeting that when faced with issues like these we often seem to develop a reactionary response rather than crafting a plan that extends over time. When this occurs, it is easy to lose sight of the issues and to run the risk of not developing more enduring solutions.

Clearly our efforts need to be directed to issues within our own institution as well as to addressing them in a context that is regional, national and global. At Stanford it is particularly important that we think creatively about how we can support our students, trainees and faculty to weather the NIH funding storm – especially since the current budgetary downturn could represent the beginning of a multi-year cycle. We need to program resources to create some bridge funding that we can use for critical interventions. The Dean's Office will work with the Executive Committee to come up with plans about how to do this. Clearly we also need to be sure that the investments we make are wise and to seize the funding opportunities that are available.

I believe that because of the work we have done to implement *Translating Discoveries*, we should be competitive for NIH funds that will emphasize interdisciplinary or translational research through the NIH Roadmap and its further evolution. But we need to address finding new funding opportunities as they develop. For example, while funds for the physical and engineering sciences will impact discrete areas in those disciplines, there are many connections between the physical and life sciences that have been well established by Stanford faculty – and that should be further developed as these opportunities emerge. In addition, it seems likely that funding will be available for addressing the prospect of influenza pandemic, and we should be thinking about how to be competitive for those funds as well. And, of course, in California we have the prospect of considerable state-supported funding for stem cell research through the California Institute for Regenerative Medicine – once the litigation is resolved – and that will surely help compensate for limitations in federal funding for biomedical research, at least in selected areas.

These potential funding opportunities, coupled with the reality that we have among the most successful faculty in the nation in the competition for NIH funding, mean that the situation at Stanford is not as likely to be as bleak as in a number of other institutions. And while one of our biggest current constraints is the lack of research space we are, ironically, lucky that we have not constructed a lot of space with the expectation of an increasing share of a growing NIH research pie. At least as we bring on new research space it will be planned for areas where we have high confidence of success – and the likelihood that we will attract faculty who will make that success achievable.

In addition to addressing issues within Stanford, we also need to focus on the regional and national challenges. Clearly the continuing education of our community about the important linkage between basic research to translational research and improvements in patient care is essential. We have in fact been actively engaged in this over the past several years, and those efforts must continue. It is incumbent on all of our faculty and students to do what they can to further foster the educational dialogue with our community.

We must also reach out to the business community. As a member of the Board of Directors of the California Healthcare Institute, which is comprised of CEOs from the biotechnology and pharma, as well as academic leaders, I am convinced that it is essential that this community be engaged in making the case for the importance of fundamental research and for the critical linkage between academia and industry in the development of drugs, biologicals and devices. Such messages need to be carried more broadly to our state and federal government leaders and officials by visits to Sacramento or Washington or by hosting congressional visits to Stanford. Thanks to the efforts of Ryan Adesnik, Director of Federal Relations and Paul Costello, Executive Director of Communications and Public Affairs, we have already initiated such programs both at Stanford and in Washington. Obviously, additional efforts are needed.

Ideally we need to work collaboratively with our professional societies to shape as common a message as we can. Work through FASEB (Federation of American Societies for Experimental Biology) is achieving this in part. We were told during the AAMC meeting that asking for additional funding or pleading the damage that will be done to the biomedical research enterprise under the current budget plans will likely fall on deaf ears. While I understand that there may be congressional ears that are indeed deaf to requests for more funding, I don't agree that we should step back from advocacy. In fact, it seems obvious that not engaging the policy makers would be a mistake and could lead to even further erosion of funding. Certainly nothing will be gained by pitting science against itself, so that arguing for biomedical science versus the physical and engineering sciences would be counterproductive for all. But making the linkages clear could help, as would thoughtfully describing how research – even when it takes decades – can produce remarkable changes in human health. This is self-evident to all of us in the biomedical research community, so it is shocking to recognize that many Americans, including our government leaders, don't understand or appreciate this. As I have stated frequently, we have considerable education to do, but we also need to make sure that our message is clear and is spoken in a manner that is understood by our audience.

I fully recognize that many of my comments will prove disturbing to most readers. I have tried to not be hyperbolic, but I have not hesitated to convey what I have heard in a number of settings, most recently the AAMC meeting I just attended. While denial would be easy, this is a time when we all need to take some steps back and reflect on how we can better make our case. Whether we like it or not, the current situation makes it evident that we have missed the mark in changing the minds of our government leaders. I will certainly continue to do my part, but it is clear that we all need to join in. If you have additional suggestions or recommendations I would welcome hearing them.

The Many Faces of Compliance

On January 10th I co-chaired a workshop on compliance sponsored by the Association of Academic Health Centers (AAHC). The stimulus for this meeting was the view emerging from many academic medical centers (AMCs) that the regulations impacting universities, medical schools and teaching hospitals are rapidly increasing and are consuming ever more resources and time— especially at those institutions engaged in research, particularly clinical research. While there are many credible reasons for care, scrutiny and regulation about the work we carry out in AMCs, the increasing time and money spent to support the required regulations and reports are ever more burdensome – and seemingly without end. Accordingly, the goal of this workshop was to review the broad landscape of compliance issues and compare experiences among leaders in the field on how we might better address them. Some of the increased compliance requirements are the consequences of errors or problems that have arisen in various centers, and, to a degree, they reflect a lack of trust or confidence by the public or regulatory agencies.

In anticipation of this meeting I asked Steve Jung, Director of Internal Audit and Institutional Compliance, to share with me the major concerns he faces in assuring that Stanford avoids infractions that could damage its reputation or result in adverse consequences to faculty, schools or the university. His concerns were based on his own assessment as well as shared experiences from peer institutions, and they were far-ranging. Included among the issues creating potential vulnerability are: individual or institutional conflict of interest, problems in faculty effort reporting, failure to abide by NIH salary caps, failure of PIs to properly and timely certify effort, lack of certification or documentation of proper training in human subject research, inadequate security of confidential information within university databases and networks, safety or biohazard laboratory infractions or inability to identify “restricted persons”, lack of compliance with Medicare billing rules or lack of documentation for billing in clinical research, lack of compliance with reporting under the Patriot Act or in export controls, improper treatment of laboratory animals, etc.

At the workshop we spent a considerable effort delineating the issues surrounding these and other compliance challenges and then focused on how we could better address them going forward. A strong sentiment was expressed about the need to build better bridges to the groups imposing the increased rules and regulations, in order to better understand their perspective (if possible) and to engage in a proactive dialogue that brings the parties together before the rules are formulated and imposed. Naturally attention also turned to seeking ways to make the demands more harmonized and less counterproductive, given the manner in which they impact our missions in education, research and patient care. There was also the recognition that a likely factor promulgating increased regulation is the heightened distrust of the AMC or university that has been spawned by noteworthy (and often newsworthy) scandals. Hence, a greater focus on professionalism as a core value in our medical centers, for students and faculty, is an imperative.

Needless to say, the coupling of decreased federal support for research (see above) with increased regulation constitutes a serious impediment to our success – and morale. Since both of these challenges can be related, at least in part, to failure to educate our constituencies or better secure the public trust, it is evident that we have considerable work ahead of us.

Institutes, Strategic Centers, Departments and the School of Medicine

In previous issues of the Dean's Newsletter I have written about the ongoing progress that is taking place to further develop our Stanford Institutes of Medicine and Strategic Centers. In doing so I am cognizant of the changes that these new programs will bring and mindful of how they will interact and interface with important existing programs in departments and throughout the School. A major reason for championing the Institutes as a key facet of our overarching plan of *Translating Discoveries* is my belief that big bold ideas that link faculty and students/trainees across the School and University to address important issues in bioscience and human health will capture the attention of our community and help us to raise the funds needed to carry out our important work throughout the School. To help further link and connect these efforts I chaired another in our series of mini-retreats with Institute and Strategic Center Directors on Saturday, January 14th.

While I have stated the following in numerous other settings, I still feel compelled to underscore that the Institutes, Strategic Centers and other broad initiatives could not take place without the remarkable foundation in basic science that exists at Stanford. Without that we would be building on sand. But given our strong foundation – and its continuing organic strengths – I am confident that we can create new organizational alignments that we can all be proud of.

Among our five Institutes (I count the Cancer Center among these) continued progress is being made, although some are ahead of others at this juncture. Indeed, I would say that the Comprehensive Cancer Center is now the leading edge and is surely being further catalyzed by the rapidly approaching February 1st deadline for submission of our grant proposal to the National Cancer Institute. I am pleased with the progress that has been made to date and deeply appreciative of the leadership of Drs. Irv Weissman, Bev Mitchell and Steve Leibel, who together encompass the spectrum of basic research, translational medicine and patient care. They are also building on the seminal efforts of Dr. Karl Blume during the past three years. The very positive reviews we have received from external advisory boards and scientific consultants over this time are gratifying and, while our success in securing the grant is by no means guaranteed, I know that we will make a good showing. It may have taken 35 years for Stanford to finally make a submission to the NCI to become a designated comprehensive cancer center, but I am pleased that we will now do so.

Perhaps the next most established Institutes are Stem Cell Biology and Regenerative Medicine and the Neurosciences Institute at Stanford. Of course they are also among the oldest of our Stanford Institutes of Medicine. While the goal of each institute is to engage

faculty from across the University, the broad mandate for these two Institutes is actualized in many constituencies. Of course, assuring that faculty and students from different disciplines feel fully engaged valued and responsible is not an easy task but is an essential one to fulfill. The fact that executive steering committees have leadership from different schools is one way of accomplishing that goal.

It is notable that the Cancer Center and the Stem Cell Biology and Regenerative Medicine Institute have already begun to fulfill one of the key factors for their success – namely, competing for and garnering significant financial resources. And at this point I believe that the NIS is at the cusp of similar success. During the next year we anticipate continued progress, particularly thanks to the very positive changes that continue to unfold in our Office of Medical Development.

Both the Cardiovascular Institute and the Institute for Immunology, Transplantation and Infection are also making continued progress, but they are still evolving in their leadership and planning. Nonetheless, I am pleased with the directions they have taken to date.

Since the last interaction of the Institutes and Strategic Centers a lot has transpired behind the scenes. Imaging continues to be particularly strong thanks to the vision of Dr Gary Glazer and the significant efforts of Dr. Sam Gambhir in the increasingly exciting domain of molecular imaging. This is also a field that engages very broad faculty interest and commitment. Also noteworthy is the continued development of a broader mandate for Genomics and Human Genetics under the leadership of Dr. Rick Myers. Together these areas touch a broad community and, while they are both unique disciplines in their own rights, they are also important enablers for the Stanford Institutes of Medicine and various school-wide activities. Underpinning these efforts are the ever-increasing interactions among the physical and life sciences at Stanford, codified some years ago as BioX and now embraced in our new Department of Bioengineering. And to further facilitate handling large databases are fields in which there is considerable expertise at Stanford, including biostatistics, bioinformatics and clinical informatics.

Given the reality that significant components of NIH funding are now being closely tied to interdisciplinary research and education, our Stanford Institutes of Medicine and emerging Strategic Centers represent an important resource for our broad faculty community. The alignments they create should make us even more competitive and thus provide a resource to our basic and clinical department throughout the School.

Women's Health – Emerging Initiatives

Thanks to the vision of Dr. Robert Robbins, Director, Stanford Cardiovascular Institute and Chair, Department of Cardiothoracic Surgery, and with the help of the Office of Medical Development, a wonderful gathering and presentation highlighting women's health was held on Friday, January 13th. The guest speaker was Dr. Nanette K. Wegner, Professor Medicine at Emory University School of Medicine and Chair, Department of Cardiology at Grady Memorial Hospital.

Heart disease has emerged as the number one killer of women in the United States. In response to this, the Women's Heart Health at Stanford program has been developed to carry out risk assessment, diagnostic evaluation, risk management, education and coordinated care. For additional information about this program contact Ms. Mary Sweeney (msweeney@stanford.edu).

In her lecture, Dr. Wenger reviewed the recommendations that have emerged from the American Heart Association (AHA) "*Evidence-Based Guidelines for Cardiovascular Disease Prevention in Women*" that were published in *Circulation* 2004;109:672-293. The evidence-based guidelines for women continue to evolve as data is accrued and analyzed, and Dr. Wenger updated some findings that have emerged since the publication of the aforementioned guidelines. Because readers of the Dean's Newsletter include individuals with medical backgrounds as well as many who have other areas of expertise I thought it would be helpful to briefly outline some of the key factors.

While a number of the AHA recommendations are generic, those published in the aforementioned article have been determined from specific studies in women. The recommendations are stratified on the basis of risk for cardiovascular heart disease (CHD) over a 10-year period as optimal or lower risk (<10% risk), intermediate risk (10-20% risk) and high risk (>20% risk). Modifying risk factors include a prior history of CHD, diabetes, metabolic syndrome, first degree relatives with early-onset (age: <55 years in men and <65 years in women) of atherosclerotic CHD. Among the important recommendations are:

1. Lifestyle Interventions

- *Smoking cessation*
- *Physical activity* (a minimum of 30 minutes of moderate-intensity physical activity on most and preferably all days of the week).
- *Heart healthy diet* in which fat comprises <10% of calories, cholesterol <300mg/day and trans fatty acids are limited.
- *Weight maintenance* through balance of physical activity, caloric intake and where necessary formal behavioral programs to achieve a BMI between 18.5-24.9 kg/m² and a waist circumference of <35 inches.

2. Major risk factor intervention

- *Blood pressure* – should ideally be <120/80 mm Hg.
- *Lipid profile* should have LDL <100 mg/dL, HDL >50mg/dL and triglycerides <150mg/dl.

Modification of risk factors may be achieved non-pharmacologically but may require drug therapy. Of note, one of the myths that Dr. Wenger emphasized is that hormones do not protect women from getting CHD and that estrogen replacement may actually cause complications.

I have presented a fairly superficial and high-level overview of some of the most significant factors that are relevant for women. You can learn more about this by

attending a special event on February 2nd from 5:30-7:30pm in the Clark Center Auditorium as part of the Stanford Go Red for Women Events sponsored by The Stanford Prevention Research Center, Women's Health @Stanford and the Stanford Cardiovascular Institute. For additional information about this important event call 650 723 7717 or email essmith@stanfordmed.org.

Thanks to Dr. Javaid Sheikh

I want to thank Dr. Javaid Sheikh for his exceptional five years of leadership and service as the Chief of Staff at the Palo Alto Veteran's Administration Medical Center. It has been a pleasure to work so effectively with Dr. Sheikh on a number of important issues that have impacted faculty, the VA and its interactions with Stanford. Dr. Sheikh, who is also Professor of Psychiatry and Behavioral Sciences, will continue in his role as the leader of the Cooperative Studies Program. Dr. Larry Leung, the Maureen Lyles D'Ambrogio Professor and Chair of the Department of Medicine at the VA, will serve as the acting Chief of Staff pending the outcome of a search for the permanent successor.

Please join me in thanking Dr. Sheikh.

Winter Writers Forum and Workshop Announcement

Dr. Audrey Shafer, Associate Professor of Anesthesia, asked me to share the following announcement with you.

Please join us Thursday, February 16th at 5:00 pm in the Clark Center Auditorium to celebrate the publication of two books by Stanford medical students. Shannon Moffett's book, ***The Three Pound Enigma: The Human Brain and the Quest to Unlock Its Mysteries***, and Joshua Spanogle's medical thriller, ***Isolation Ward***, will be featured. Both students received Stanford Arts and Humanities Medical Scholars grants. Also featured at the event will be David Watts MD, NPR commentator and author of ***Bedside Manners: One Doctor's Reflections on the Oddly Intimate Encounters Between Patient and Healer***. Sharon Bray PhD, professional writer and workshop leader (***A Healing Journey: Writing Together Through Breast Cancer***), will announce the launch of the writers workshop series scheduled to begin Tuesday, February 28 at 7:00 pm in the Stanford Center for Biomedical Ethics conference room.

For further information on the February 16th Forum, contact Dona Tversky dtversky@stanford.edu. For information and to sign up for the workshop series contact Paula Bailey - pbailey@stanford.edu.

These events are supported by a grant from the Drs. Ben and A. Jess Shenson Funds and sponsored by the Arts, Humanities and Medicine Program, Stanford Center for Biomedical Ethics.

The Community Education Series Continues Successfully

On Wednesday evening January 18th, Dr. Mark Davis, Burt and Marion Avery Professor in Immunology and Director of the Stanford Institute for Immunity, Transplantation, Infection, spoke to the packed Clark Center Auditorium on the role of the immune system in fighting or preventing infections, cancer, autoimmune disorders, graft rejection and related topics. The audience was keenly interested in Dr. Davis' comments and many stayed for nearly an hour after his lecture to explore questions with him. This is good evidence of how we can positively impact the community, as noted above in my commentary on the NIH.

The next Community Lecture series lecture will be held 7:00 - 8:30 pm on Wednesday, February 1st in the Clark Center Auditorium. Dr. Irv Weissman, Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine, will present "Stem Cell Science and the Future of Chemotherapy."

Awards and Honors

Effective January 1, 2006, Richard Olshen, Professor of Health Research & Policy (Biostatistics) and, by courtesy, of Electrical Engineering and Statistics, became an Institute of Electrical and Electronics Engineers, Inc. (IEEE) Fellow, with the accompanying citation:

for contributions to theory and design of decision trees and tree-structured classifiers and codes.

The IEEE Fellow is one of the most prestigious honors of the IEEE, and is bestowed upon a very limited number of Senior Members who have made outstanding contributions to the electrical and information technologies and sciences for the benefit of humanity and the profession. The number of IEEE Fellows elected in a year is no more than one-tenth percent of the total IEEE voting membership. This year 271 new Fellows were elected. Congratulations to Richard Olsen.

Appointments and Promotions

- **Steve Alexander** has been reappointed to Professor of Pediatrics (Nephrology) at the Lucile Salter Packard Children's Hospital, effective 1/01/06.
- **Bruce Buckingham** has been promoted to Professor of Pediatrics (Endocrinology) at the Lucile Salter Packard Children's Hospital, effective 1/01/06.
- **Joan Frisoli** has been reappointed to Assistant Professor of Radiology, effective 10/01/06.

- **Isabella Graef** has been appointed to Assistant Professor of Pathology, effective 2/01/06.
- **Daniel Kim** has been promoted to Professor of Neurosurgery, effective 1/01/06.
- **James Koch** has been appointed to Associate Professor of Otolaryngology – Head and Neck Surgery, effective 1/01/06.
- **Robert Shafer** has been promoted to Associate Professor (Research) of Medicine, effective 1/01/06.
- **Heng Zhao** has been appointed to Assistant Professor (Research) of Neurosurgery, effective 2/01/06.

Dean's Newsletter

February 6, 2006

Retreating Forward

The fifth annual School of Medicine Strategic Planning Leadership Retreat took place on January 26-28th at Carmel Valley. Its purpose was to assess where we have been as a school during the past several years, where we are now, and where we are going in the future. The first of the leadership retreats that have occurred during my tenure as Dean took place in January 2002. At that retreat we codified the nearly ten months of prior planning that led to the School's strategic plan, *"Translating Discoveries."* The retreats since then have assessed our progress and helped refine – and where necessary redefine – our course and direction. Equally important, these annual gatherings have helped bring our diverse community together to share a common understanding and, ideally, to move forward with a more unified resolve to address current and future challenges.

Approximately 90 individuals attended this year's retreat. Attendees included department chairs, senior associate deans, hospital and university leaders, university trustees, and representative staff, student, resident and fellow leaders. The breadth of this group reflected the varied constituencies that comprise a modern academic medical center. Indeed, one of the noteworthy challenges faced by Academic Medical Centers, including Stanford, is that one or another of our core missions (i.e., education, research and patient care) could become at odds with another – or with the overall directions or changes we need to engage in order to be a leader among research intensive schools of medicine.

This year we invited two guests who helped frame the dynamic changes that are now impacting academic medical centers writ large and that are likely to cause increased rifts if we do not anticipate and plan for them nationally. One of these, the Honorable John Edward Porter, former 21-year Congressman representing the 10th district of Illinois, spoke on the evening of January 26th about the political forces impacting science and

technology, including the NIH. You may recall that recent issues of the Dean's Newsletter addressed both the current challenges to funding from the National Institutes of Health (see <http://deansnewsletter.stanford.edu/>) and the impact of religion on science (see http://deansnewsletter.stanford.edu/archive/11_14_05.html). During his tenure in office, Mr. Porter was a true champion of the NIH, and he helped frame the case for the doubling of its budget that occurred in the 1990's. In looking at the current situation, he expressed similar concerns to mine regarding the impact of the budget reductions on the nation's investment in biomedical research.

Mr. Porter also previewed for us the American Competitive Initiative that was discussed in the President's State of the Union speech on January 31st. Increased funding for science and technology is important and welcome, and the American Competitive Initiative will hopefully have an impact on better supporting the physical and engineering sciences. At the same time, as I discussed in my last Newsletter [http://deansnewsletter.stanford.edu/archive/1_23_06.html], annual increases of funding to support biomedical research are also essential to our competitive edge. Needless to say there are many opportunities for the intersection of the physical and life sciences at Stanford – as is so evident from the Bio-X initiative. Indeed, we are likely better poised for such interdisciplinary research than virtually any other research university.

The message we heard from Mr. Porter echoed many of the concerns I raised in my last Newsletter, and I am more convinced than ever that it remains incumbent on us to seek creative solutions. One idea that Mr. Porter commented on – and that Ryan Adesnik, Director of Federal Relations, reaffirmed in his presentation at the retreat – is the importance of forging an alignment between academia and industry to better convey the importance of the nation's investment in biomedical research. (They pointed to the collaboration between industry and the physical and engineering sciences communities to make the case for the American Competitive Initiative.) Accordingly, I took this message to the Board meeting of the California Health Care Institute, which includes CEOs of major California Biotechnology as well as Pharma and academic leaders, on February 1st. Thankfully, there was considerable receptivity to my message, and we will now plan how to bring that more unified message to Washington this spring.

In addition to the important message from Mr. Porter, we also heard a provocative and thought-provoking speech from Victor Fuchs, Henry J. Kaiser, Jr. Professor of Economics and of Health Research and Policy, Emeritus and Senior Fellow at the Institute for International Studies, on the evening of January 21st. He spoke about the current and future challenges in health care and its impact on academic medical centers. Professor Fuchs has long been one of the nation's leading experts in health care economics, and he raised a number of important questions for all of us to ponder. He readily acknowledges the many deficiencies of our current health care system and, together with Ezekiel Emanuel, Chair of the Department of Clinical Bioethics at the Warren G. Magnuson Clinical Center at the National Institutes of Health, has offered an insightful alternative based on a voucher model (see "*Health Care Vouchers – A Proposal for Universal Coverage*". *NEJM* 2005; 352:1255-1260). Professor Fuchs believes this approach is much more viable than a single payer system, and he also

proffered that the recently proposed Health Savings Accounts are unlikely to control costs. In fact, in a statement related to the President's health care proposal, he noted that "these accounts are mostly just another tax shelter for high-income people...I don't see them solving the significant health problems of our time."

I certainly concur with this viewpoint and would argue that we need a much more fundamental overhaul of our health care system in the United States. Indeed, despite the excellence of care provided in some sectors (and of course I would like to include Stanford in that mix) the USA is a world leader only in the amount of money that it spends on health care (now above 16% of the GDP) and on administrative overhead!

Professor Fuchs' comments regarding the future of academic medical centers were also sobering in light of the high cost for our core missions in education, research and patient care – which may prove unsustainable over time. Indeed, he remarked that the fact that we AMC's have three missions (or "product lines" as he preferred to call them) constitutes one of our significant challenges, especially given not only the costs for education and research but also the likely decreases in future margins in patient-care revenues. He pondered whether there was a way to align these "product lines."

While I would argue that each of our missions is important in its own right, I believe that we have made more progress at Stanford than is likely the case at most academic medical centers in better aligning these discrete areas under our banner of ***Translating Discoveries***. I must immediately confess, however, that I have not been thinking about our missions as "product lines," although I can see the relevance of that way of thinking in assessing the economic impact of or threats to these areas. That said, the level of integration we have achieved was apparent in the presentations that took place at the retreat. This is not accidental - it has been very much my intent to seek ways to more optimally align our missions in education, research and patient care. Achieving that goal clearly requires close collaboration with all of our important constituencies across the School and University.

Indeed, by focusing our educational programs on training future physicians and bioscience students to pursue careers that include discovery, innovation, translation and leadership, we are more closely aligning our training programs to research and patient care missions. Further, as we discussed at the retreat, we have taken a comprehensive approach to educating leaders across all of our programs. These include:

- The Scholarly Concentrations featured in the new medical school curriculum, which have been developed under the leadership of Senior Associate Dean Julie Parsonnet.
- The opportunities available through the MD/PhD programs (which we are seeking to expand) that are led by Professor Greg Barsh.
- The soon to be introduced Masters in Medicine for PhD students led by Professor Ben Barres.

- The future Advanced Residency Training at Stanford (ARTS program) for residents and clinical fellows that is being developed by Professor Sam Gambhir.

Each of these programs is aimed at equipping graduate and post-graduate students with the knowledge and skills to discover, innovate and, where appropriate, translate research to improve patient care.

We are also in the process of drawing these missions more closely together by featuring educational opportunities, such as Scholarly Concentrations, in each of the major research disciplines presently represented in the Stanford Institutes of Medicine. And, as you know, the Stanford Institutes of Medicine themselves are closely aligned to specific clinical centers at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. Indeed, at the retreat we heard some terrific progress in how each of the Institute programs are engaging members from the broad university community and creating opportunities for innovation and discovery related to clinical challenges. Thus, while the distinctions among our three missions must be respected because of what they do in their own right, we have also developed a path to connect them – which will surely place us in a stronger position in the future. Further, we have also developed closer connectivity with other Schools in the University through our education programs and the Stanford Institutes of Medicine. This should provide an additional source of excellence and strength to help buffer us through the changing landscape of health care financing that we will surely experience in the years ahead.

There is no question that we have made progress in each of our key initiatives. But there is no doubt that we have a long way to go in order to fully secure the future of these initiatives. This is an effort that will require ongoing diligence, planning, coordination and cooperation. I am grateful to all who have worked so hard to get us to this point – but it will only be through our cooperative efforts that we will make the necessary progress in the months and years ahead.

If you are interested, the reports and proceedings of the 2006 Leadership Retreat will soon be available on our Website <http://medstrategicplan.stanford.edu/>.

Learning About Medical Development

While strategic planning is an essential component of our programmatic future, the full realization of our programmatic and capital needs requires considerable funding and support. In the January 9, 2006 issue of the Dean's Newsletter, I reported on the comprehensive facilities plan that we have for the School of Medicine (see: http://deansnewsletter.stanford.edu/archive/01_09_06.html#2). In addition, we have enormous programmatic needs that have been developed collaboratively between the School and Stanford Hospital & Clinics as well as the School and the Lucile Packard Children's Hospital. Indeed, in totaling all the various needs we have identified to date (as well as those that will emerge from basic and clinical departments) we are looking at upwards of \$1B in fundraising needs during the next 5-7 years. Achieving these

significant goals will require enormous efforts from our faculty leaders and tremendous support and cooperation from our Office of Medical Development.

On Friday afternoon of the retreat we turned our attention to the exciting opportunities and challenging needs we face in raising more private support to achieve our vision. Martin Shell, the University's Vice President for Development, updated us on the status of the major fundraising campaign that Stanford is planning. This will be Stanford's first "comprehensive" campaign in nearly two decades, meaning that it will embrace all of the University's various units and programs. The Medical Center will play a major role in this endeavor. Doug Stewart, Associate Vice President for Medical Development and Alumni Affairs, updated us on the progress made by the Office of Medical Development, which is moving swiftly to hire impressive new staff and align those staff and other resources around our campaign priorities. Doug and his colleagues explained the planning process that OMD has led during the past ten months to bring greater specificity or "granularity" to the visions of the Institutes and other major priorities from the School and Hospitals, an exercise that has already helped us build credibility among key University leaders. The fundraising opportunities that emerged are exciting and embrace the entire range of our educational, clinical and research agendas. More work will be continuing in the coming months to refine the goals.

Saturday morning saw a change of gears as we launched our "Development Academy" -- a program intended to give School of Medicine faculty greater appreciation of their roles in the development process and to enhance their effectiveness in engaging prospective donors and working with the development office and institutional leaders to maximize gift potential. Doug Stewart shared his insights about how generational differences affect individuals' attitudes about money, philanthropy and institutions, and led us through an exploration of the many perspectives and motivations of donors. The "Cycle of Successful Development," from identification of prospective donors, through their engagement and eventual solicitation, was covered.

To make some of the theory come alive, the morning concluded with several exercises that involved retreat participants playing roles in fundraising situations with prospective donors. I think everyone agreed this was a fascinating and useful program that made all of us aware of our important roles in the development process.

You will be hearing more about the Development Academy soon. Seminars are planned on topics including how clinical faculty can work effectively with prospective donors, and how all of our faculty can identify and engage effectively with foundations.

A Milestone for Our Nascent Cancer Center

Following three years of planning, Stanford's 1,200 page proposal to become a National Cancer Institute designated Comprehensive Cancer Center was submitted to the National Institutes of Health on February 1st. This represents the first time that a proposal to become a Comprehensive Cancer Center has actually left Stanford, and it is a milestone in the evolution of our institutional planning in cancer research, treatment and prevention.

During the past three years many dozens of individuals have worked diligently to achieve this benchmark. I want to particularly thank each of our faculty leaders and, in particular, Dr. Karl Blume, Professor of Medicine Emeritus, who nearly single-handedly laid the foundation for the grant by bringing together members of our basic and clinical science community – along with colleagues across the university – to formulate the initial planning for the grant submission. He also played a key role in establishing the very important affiliation with the Northern California Cancer Center, which adds considerable strength to the population science components of the grant. This also led to the recruitment of Dr. Dee West as Professor of Health Research and Policy. Dr. West is a highly recognized authority in this area of investigation and is now working with the Stanford community to enhance our programs in population science.

A major step forward in our march to apply to the NCI occurred last summer with the recruitment of Dr. Bev Mitchell, Professor of Medicine and Associate Director of the Comprehensive Cancer Center, from the University of North Carolina. Dr. Mitchell has worked tirelessly along with Drs. Steve Leibel, Medical Director of the Clinical Cancer Center, and Dr. Irv Weissman, Virginia & D.K. Ludwig Professor for Clinical Investigation in Cancer Research, Professor of Developmental Biology, and Principal Investigator for the Comprehensive Cancer Center. Each of the Project and Core Program leaders did an outstanding job in the preparation of the exciting proposal that has now been submitted to the NCI. While we will need to wait for the formal review process, I am encouraged by the excellent feedback that we received from two external advisory committees and consultants, and I am optimistic about our ultimate success. That said, this is a highly competitive process and we all envision that our proposal will be highly scrutinized during the review process. Currently we anticipate a site visit in May and news about our success (note I am not mentioning failure) sometime in the summer. If we are successful we will be on three-year interim cycle with the final approval occurring at that time (likely about 2009).

I also want to thank Ms. Joanne Murphy, Associate Director for Administration, and the many other individuals who worked so hard to bring this project to its current state of fruition. Regardless of how it turns out it is a great credit to our Stanford community that we achieved this important milestone. Obviously additional updates will follow in time!

Emergency Preparedness

On Tuesday January 24th the Stanford University Medical Center hosted a community education session entitled “Emergency Medicine at Stanford”. I co-hosted this event with Ms. Martha Marsh, President and CEO of Stanford Hospital & Clinics.

We are all cognizant of the dramatic realizations about community readiness that have occurred in the wake of 9/11 and Hurricane Katrina – and that are now being anticipated for an influenza pandemic. These events have all too poignantly revealed the vulnerability of our support services, and they underscore the importance of becoming better prepared – as individuals, medical centers and communities. While national preparedness is important, the stark reality is that when a natural or man-made disaster

does occur its impact is local – and the affected community is often on its own for the first days. Certainly the Medical Center has been actively involved in emergency preparedness, but we also recognize that our resources would be limited in the event of a major event. – This realization underscores the importance of developing a more integrated plan that encompasses the university as well as our regional communities. In this regard, the University has also been refining its Emergency Management Program and has recently presented its findings to the University Cabinet and Senate, as recently described in the Stanford Report (see <http://news-service.stanford.edu/news/2006/february1/planning-020106.html>).

The focus of the January 24th presentation was on medical preparedness and was led by Drs. Paul Auerbach, Clinical Professor of Emergency Medicine, and Robert Norris, Chief of the Division of Emergency Medicine in the Department of Surgery. They reviewed the current status and range of programs and their efforts to further enhance them for future serious events. In addition, a series of presentations focused on more specific areas of interest including “Prepared for Disaster” by Dr. Eric Weiss, “Weekend Warriors” by Dr. Daniel Garza, “Life-Threatening Emergencies” by Drs. James Quinn and Rebecca Smith-Coggins and “Wilderness Medicine” by Dr. Robert Norris.

Attendance was robust and interest high in the topics that were presented. I want to offer my thanks and appreciation to the program leaders and faculty for outstanding jobs and to the Office of Medical Development for their care and attention in coordinating the event and making it so successful.

SUMMA 2006

The 2006 Annual Stanford University Minority Medical Alliance (SUMMA) Conference occurred on Saturday February 4th. Second Year Stanford Medical Students Chioma Agbo, Alex Red Eagle, and Reza Ehsanian organized the conference. SUMMA is a coalition of Stanford medical students, including representative from Student National Medical Association (SNMA), Latino Medical Student Association (LMSA), and Stanford American Indigenous Medical Students (SAIMS) that is committed to recruiting and retaining underrepresented medical professionals. The goal of the SUMMA is to increase the number of minorities in the health professional fields in order to better serve African American, Latino and Native American communities.

Each year, SUMMA hosts the largest minority premedical conference on the west coast, typically drawing 400-600 attendees each year. While the majority of attendees are in college, a number of high school students also attend. The goal of the conference is to increase the number of minority applicants to the health professional fields. It provides both broad educational topics as well as focused practical advice, including how students can become better applicants to medical school, such as the actual application process, MCAT preparation, interviews, etc. The conference is organized and run by students – and represents a major commitment of their time and energy. I want to thank Chioma, Alex and Reza for all they did to make the conference so successful

Clearly, enhancing opportunities for minority students to better establish their interests in medicine and science and to be successful in gaining admission to professional and graduate school is a high priority for the School of Medicine and University. This is also a major focus of a number of faculty whose commitment to improving diversity has impacted significantly on the School. While numerous faculty are engaged in this effort, I want to thank in particular Drs. Ron Garcia, Gabe Garcia, Fernando Mendoza and Hannah Valantine.

An Update from the Office of Diversity and Leadership

Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, and Barb Miller, Associate Director, have provided two updates regarding our efforts to continue leadership development as an essential component of career growth in the School of Medicine.

First, they report that the first group of School of Medicine Faculty Fellows has been chosen. This program was announced in November and represents an important component of our leadership enhancement efforts throughout the School and Medical Center (see: http://deansnewsletter.stanford.edu/archive/11_28_05.html#2). Importantly, thanks go to all of the nominators who took time to put candidates forward. In fact, fifty-six nominations were received, and the selection committee consisting of Drs. Hannah Valantine, Fernando Mendoza, Oscar Salvatierra and Bill Mobley, had a challenge to narrow the group down to those who could be offered entry to this year's program. While the original plan was to limit the size of the group to 10 individuals, because there were so many outstanding applicants, the inaugural group was expanded to 17.

The first School of Medicine Faculty Fellows are: Drs. Janice Wes Brown, James Chen, Clifford Chin, Sheila Coogan, Myriam Curet, Ricardo Dolmetch, Ramona Doyle, Tracy George, Iris Gibbs, Sabine Girod, Hayes Gladstone, Anthony Oro, Minnie Sarwal, Eric Sibley, Eric Sokol, Karl Sylvester, Sharon Williams. I will have the opportunity to speak at the Faculty Fellows program and I look forward to getting to know each of the Fellows better.

Second, Dr. Valantine asked me to let you know that a series of workshops on leadership for women will be initiated in February. The information about this program follows:

Women and Leadership Conference

12-5:30 pm Thurs., Feb 16, and 8:30-5:30 pm Friday, Feb. 17.

<http://ethics.stanford.edu/wlconference/index.html>. **To register, send an email message to bmore@stanford.edu.** Registration will be limited.

Workshop on Leadership, Management, and Influence

Professor Neale and her Graduate School of Business colleague Professor Deborah Gruenfeld in February and March. The sessions will be from 12 - 5 pm on Fridays Feb. 24, March 3, and March 10; and from 9 am - 12:15 pm on Saturdays Feb. 25, March 4, and March 11, with a closing lunch

from 12 - 1 pm on Sat. March 11. **To register, send an email message to facultydevelopment@stanford.edu** Registration will be limited.

Where There's a Woman There's a Way: the Path to Leadership in Higher Education

The Northern California Chapter of the Office of Women in Higher Education of the American Council on Education is sponsoring a daylong workshop about academic leadership in San Francisco on Friday, March 24 for women faculty at Northern California colleges and universities. Stanford is one of the sponsoring universities. The program and instructions on how to register can be found at <http://www.sonoma.edu/socsci/ace-owhe/index.htm>. *There is a \$75 early registration fee, but the Faculty Development Office will reimburse the fee for women faculty who attend, so save the receipt you will receive and send it to us after the conference.* Registration will be limited.

In addition, Dr. Valentine has invited all participants at the February 16th program to join her for dinner afterward. Please let Barb Miller know if you are interested in joining Dr. Valentine for dinner and if you are attending any of the workshops. Barb Miller can be reached at bemiller@stanford.edu.

Leadership Training in Pediatrics

At the Lucile Packard Children's Hospital Board of Directors Meeting on Tuesday, January 31st, Dr. Ken Cox, Chief Medical Officer (LPCH) and Senior Associate Dean for Pediatrics and Obstetrics, provided an update on the Physician Leadership Program, entitled Packard Basics 2012, which he is leading with Mr. Chris Dawes, President and CEO of LPCH, and Jane Binger, RN, EdD. This is a seven-year initiative designed to foster and develop leadership and performance skills for the 81 physician leaders currently at LPCH. It is based on the highly relevant view that strong administrative leadership skills are necessary to assure that LPCH – and the School – achieve their strategic initiatives.

The program is divided into modules. The first includes a self-assessment, workshops and discussion groups, 360-feedback and goal setting. To further enhance this program an online LPCH Knowledge Bank is being developed to provide new leaders with facts and resources to handle leadership challenges.

This is an important program and I certainly commend Dr. Cox, Mr. Dawes and Dr. Binger for their own leadership and efforts. Of note, a leadership forum is also being sponsored by SHC thanks to the efforts of Dr. Joe Hopkins. Putting together the Hospital programs with those of the School shows that we have an increasing array of leadership development opportunities now available across the medical center – which is certainly welcome and important news.

Awards and Honors

We are proud to announce that two Stanford MD students - ***Yashar Kalani and Dora Castaneda*** – have just been awarded Soros Fellowships. The Paul and Daisy Soros program was established in 1997 and recognizes the extraordinary academic achievements of immigrants or children of immigrants. Others currently in the MD class with Soros fellowships awarded in previous years include Gabriel Tsao, Rajesh Gupta, Amy Chow and Katie Gladysheva. Since the Foundation selects only 30 students per year nationwide out of 1000, this is a tremendous track record for Stanford and a great honor to the students. Congratulations to Yashar and Dora!

Appointments and Promotions

- ***Firdaus Dhabhar*** has been appointed to Associate Professor of Psychiatry and Behavioral Sciences, effective 2/01/06.
- ***Phyllis Gardner*** has been promoted to Professor of Medicine, effective 2/01/06.

Dean's Newsletter February 21, 2006

Understanding Bias

I want to bring to your attention an important upcoming lecture by Dr. Jo Handelsman, Co-Director of the Women in Science and Engineering Leadership Institute and Howard Hughes Medical Institute Professor, Department of Plant Pathology, University of Wisconsin-Madison. Dr. Handelsman will speak on Thursday, February 23rd at 2 p.m. in Fairchild Auditorium on "Understanding our Biases and Assumptions: Male and Female." Dr. Handelsman and her colleagues have been clear spokespersons for career development and the impact of bias. I am particularly grateful to Dr. Suzanne Pfeffer, Professor and Chair of the Department of Biochemistry, for her leadership in inviting Dr. Handelsman to visit to Stanford so that she can share her observations with us.

As a prelude to her presentation, Dr. Handelsman writes, "We all like to think that we are objective scholars who judge people based entirely on their experience and achievements, but copious research shows that every one of us brings a lifetime of experience and cultural history that shapes the review process. The results from controlled studies in which people were asked to make judgments about subjects demonstrate the potentially prejudicial nature of unconscious assumptions we make. Examples range from physical and social expectations or assumptions to those that have a clear connection to hiring and awarding fellowships and tenure."

In her lecture, Dr. Handelsman will summarize research on bias in academic contexts and present strategies for using an understanding of biases to correct them. This promises to be an extremely worthwhile event and I encourage everyone to attend. I am sorry that I will be out of the country at the time of her visit, but I will be most interested in what our community learns from attending this important presentation.

Improving Health

Among the three major Stanford University initiatives for the next decade is “improving health” – along with sustaining the environment and international affairs and issues. These are all part of Stanford’s effort to use its extraordinary intellectual and creative resources to help improve the world condition – an important role for a university at a critical juncture in global history.

But how should we go about “improving health?” Along with Dr. Matt Scott, Professor of Developmental Biology and of Genetics and Program Director of BioX, I had the opportunity to offer some reflections on this issue to the University’s Campaign Steering Committee on Monday February 13th.

There are a number of intertwining themes that work either in synchrony or in conflict concerning the health of our community, nation and world. As a small research intensive School of Medicine and Academic Medical Center we must be circumspect in how we address the currently polarized forces of continued advances in biomedical research, on one hand, and a defective and fragmented health care system in the USA, on the other, along with broad global challenges that could either enhance or seriously compromise the health of our nation or world.

Without question what Stanford does best is contributing to fundamental discovery and innovation. Accordingly, this must be the core of our efforts in “improving health.” Over the past several years we have attempted to galvanize the School of Medicine’s fundamental missions in education, research and patient care under the umbrella of “**Translating Discoveries**” (<http://medstrategicplan.stanford.edu>). Indeed, if **Translating Discoveries** serves as our overarching vehicle for improving health, it is important to reflect on its fundamental foundation and governing organization.

At Stanford, the foundation for **Translating Discoveries** is our continued commitment to fundamental basic science discovery and innovation. We have the unique advantage of carrying out this work with highly talented faculty, students and staff who work in an environment that fosters novel approaches to scientific discovery. Furthermore, Bio-X, the faculty-initiated initiative that creates innovative intersections among the physical, engineering, computational and life sciences has become a Stanford hallmark. The fact that these interdisciplinary interactions have arisen at Stanford relates to our environment, in which all schools are in close proximity, and to our culture, which fosters interaction and a willingness to engage in non-traditional thinking. These fundamental underpinnings will assure that Stanford remains at the forefront of discovery – but they also mandate

that we continue to support and foster these efforts. This is even more important at this juncture, when the funding for biomedical research is challenged.

Themes emerging from our basic and clinical departments related to important disease or discipline- based opportunities are built on the fundamental underpinning of faculty-driven basic science and Bio-X and must also be fostered. In order to further optimize our impact we are also building the interdisciplinary and interschool Stanford Institutes of Medicine in Stem Cell Biology and Regenerative Medicine; Cancer; Neuroscience; Cardiovascular; and Immunity, Transplantation, Infection. All of these draw faculty from throughout the University and are also connected to clinical centers at both Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. In these ways we are creating a bi-directional continuum that connects scientific discovery with improving health. It also links innovations throughout the university with opportunities for translation in the Medical Center and ultimately the nation and world.

In addition to improving health through research and its application to patient care, educating and training future leaders comprise an essential and defining aspect of our capacity to translate discovery and foster innovation. The various changes we have made – and continue to make – in our education and training programs also contribute to the disciplinary alignments and workforce supply that will be needed to assure the future success of Stanford and the biomedical research enterprise (the latter is all too challenged in many academic medical centers because of limited resources or a less focused mission).

In many ways our core mission of translating discoveries through education and research offers a paradigm for how we can most optimally expand our efforts both nationally and internationally. As mentioned in prior Newsletters, recently we have been thinking carefully about how the School of Medicine should relate to the University international initiatives being developed through the recently named Freeman Spogli Institute for International Studies (see: <http://fsi.stanford.edu/docs/about/>). While our thoughts are still formative, it would seem that developing teams and relationships, analogous to those so creatively delineated by Dr. Paul Yock, the Martha Meier Weiland Professor in the School of Medicine, Professor and Co-Chair of the Department of Bioengineering, and founder of the Stanford Biodesign Program (see <http://www.stanford.edu/group/biodesign/>), might provide a means to anchor our efforts. Indeed, creating teams that include participants from Stanford and other nations could well provide an important linkage between *Translating Discoveries* and *Improving Health*. And such efforts could further provide connections between Stanford, biotechnology and public agencies, including the NIH, along with other global partners.

But these efforts will not achieve their optimum impact in improving health if we do not also address the systems for health care access, quality, economics, public policy, public health and preventive medicine. This means, of course, that the initiatives described above must be coupled with innovative research and discovery around these important social and societal factors impacting health nationally and globally. Much of the expertise in these areas resides in other academic units and collaborating centers throughout the

University, but their linkage to improving health is as critical as bioscientific research discovery, innovation and translational medicine. The good news is that there are remarkably talented faculty and students working on these issues – although they are not necessarily aligned at this point under the overarching banner of the University initiative. Clearly these areas need to be another important facet of the initiative in improving health

In sum, the goal of improving health is multifaceted and – at least for Stanford – must emanate from our core missions in discovery and innovation. These must be cross-disciplinary and address the most important challenges in bioscience and ultimately in the translation of knowledge to improve human health. A focus on preventing disease is critical, as is addressing ways to improve the health care system in the USA. By aligning our School of Medicine initiatives to the important Stanford University international health initiatives we will have every reason to be confident that Stanford will an important leader and innovator in improving the health of our community, locally and globally, in the 21st century.

Interactions with Pharmaceutical and Other Industry Vendors – Towards an SUMC Policy

As you likely know, I have been concerned about the pervasive presence of the pharmaceutical industry in the medical profession for some time and have discussed it in the June 30th and July 25, 2005 Dean's Newsletters (see respectively http://deansnewsletter.stanford.edu/archive/06_30_05.html and http://deansnewsletter.stanford.edu/archive/07_25_05.html). We have had an ongoing series of discussions and deliberations surrounding this, spawned in part by a presentation last summer at the Executive Committee by Dr. Gilbert Chu, Professor of Medicine and of Biochemistry, who laid out the issues clearly and unambiguously. During the fall, I asked Dr. Harry Greenberg, Senior Associate Dean for Research, to head up a working group to develop a policy for the entire Medical Center that would govern our interactions with the pharmaceutical industry. At the Executive Committee meeting on Friday, February 17th, Dr. Greenberg presented a progress report of the group's work to date.

The working group has five policy elements under consideration. It is interesting to note that, during the course of the deliberations of the working group, the scope of the policy expanded beyond pharmaceutical companies to include device and research equipment companies. It is also notable that during this same time an article was published by Brennan, TA et al entitled "*Health Industry Colleagues That Create Conflicts of Interest. A Policy Proposal for Academic Medical Centers*" (**JAMA** 2006. 295: 429-433) that has generated considerable press coverage and discussion. In addition, the Yale University School of Medicine also posted policies that it is now putting into effect that bear significant similarity with those being contemplated at Stanford.

Over the next weeks we would like to define a Stanford policy that can be adopted by the entire Medical Center. In doing so, it is important to solicit as much input and discussion as we can – since that at the end of the day our success in implanting a policy will depend

on each member of our community. Accordingly, I want to share with you the draft formulations of the policy with the hope of getting comments and feedback from you. For simplicity sake it is divided into five sections:

I. Gifts

Under the policy, no tangible, personal gifts of any kind, no matter how small (e.g., including pens, food), and educational materials (including textbooks, pamphlets, and journal articles) would be accepted at any location in the Medical Center.

II. Access by Vendors

Under this policy, vendors providing tangible, personal gifts, food, entertainment, drug samples, or the like would have no access to the School of Medicine or hospitals. The policy would encompass vendors representing:

- Pharmaceutical companies (Note: requests for information re: new drugs in the formulary, including requests that pharma reps come to campus for a faculty-sponsored event, would be directed to hospital Pharmaceutical and Therapeutics Committees.)
- Medical device companies (Note: in-service training for devices already purchased or faculty-invited vendor visits for consideration of new purchases would be allowed.)
- Research equipment companies

III. Support of Stanford-sponsored Activities

- The sponsorship of Stanford activities by industry would be governed by policy provisions based on the Standards for Commercial Support recently promulgated by the Accreditation Council for Continuing Medical Education (ACCME). These standards specify, for instance, that funds received must be unrestricted with respect to content and speakers.
- Under the policy, funds could be received centrally or by departments or divisions, but this policy would be followed wherever the funds are received.

IV. Education

Under this policy, it would be required that new medical and graduate students, postdocs, fellows, residents and staff receive some education about conflicts of interest and the role of pharmaceutical gift giving on prescribing practices.

V. Other Faculty Activities

- Participation in non-CME pharma-sponsored activities that do not follow CME or CME-like guidelines would be strongly discouraged. Use of Stanford name (including the use of one's Stanford professorial title) in non-Stanford, non-CME events would be prohibited.
- Faculty would be prohibited from publishing articles under their own names that are ghostwritten by pharma industry employees.

Needless to say, these policy elements engendered lively and thoughtful discussion. Most chairs were in favor of a policy with provisions along the lines recommended by the working group. There was recognition that implementing such a policy will involve changing the culture of medicine, but there was agreement that such change is necessary.

The next steps will be to further refine these recommendations and prepare the final policy, which will be reviewed by both hospitals as well as the Executive Committee. ***I welcome your comments and hope you will relay them to me.***

My thanks to the working group, which consists of: Harry Greenberg, Senior Associate Dean; Mildred Cho, Associate Professor of Pediatrics; Gilbert Chu, Professor of Medicine; Barbara Flynn, Manager, Conflict of Interest Review Program; Kathy Gillam, Senior Advisor to the Dean; Ann James, University Counsel; Shashank Joshi, Assistant Professor of Psychiatry and Behavioral Sciences; David Magnus, Associate Professor of Pediatrics; Daria Mochly-Rosen, Senior Associate Dean; Julie Parsonnet, Senior Associate Dean; Geoff Rubin, Professor of Radiology; Christy Sandborg, Professor of Pediatrics; Sheetal Shah, Director, Risk Management Controls and Education; Larry Shuer, Chief of Staff, SHC; Kelly Skeff, Professor of Medicine; Ian Tong, Chief Resident, Department of Medicine.

Architects Selected for Design of the LKC

In my January 9, 2006 Newsletter I delineated the facilities master planning we have been conducting, which lays out our 10-15 year plan for the School of Medicine (see: http://deansnewsletter.stanford.edu/archive/01_09_06.html#2). Among our highest priorities is the Learning and Knowledge Center (LKC), which will include a new 120,000 sq ft state-of-the-art building on the site of the Fairchild Auditorium in conjunction with renovations in the Lane and Always Buildings. It must be clear to all that since 1959, when the School first moved to the Stanford campus, the medical school facilities have grown up somewhat opportunistically, without clear attention to developing an integrated medical campus. Our long-term master facilities plan will seek to ameliorate this and will include, in addition to the LKC, four Stanford Institutes of Medicine (SIM) research buildings that will be constructed in the next 10-15 years. At this point, however, we will begin with the LKC and in the very near future, with SIM1, which will be housed on the parking lot just south of CCSR. We are currently proceeding with the design for the LKC with the hope that construction will commence in 2007.

In addition to housing a new conference facility, classrooms, the Knowledge Center (as a library of the future) as well as a Center for Immersive and Simulation Learning, the LKC will also serve as an anchor and new front door to the medical school. To accomplish this purpose a whole series of site preparation and infrastructure requirements (referred to by the rather unexciting name of “Connecting Elements”) will be carried out – and which will help pave the way to the integrated medical school and center campus that will unfold during the years ahead.

Because one of our goals is to draw the Medical School closer to the University, the LKC will have a southern opening (off Campus Drive), not far from Via Ortega – which will itself be transformed into a major walkway linking the School of Medicine to the Science and Engineering Quads. Accordingly, it is essential that the LKC have an attractive and welcoming appearance that signals its importance to the broader community. To help accomplish this objective, a competition was held to select the lead architect. In the late fall a short list of four architect firms were invited to submit proposals. We reviewed preliminary submissions in early December, and on January 24th each of the four firms made formal presentations to the University Land and Buildings Group and School of Medicine Facilities Group. Selecting officials included the President, an Ad Hoc Committee of University Trustees and myself.

Based on the technical and preliminary design proposals we decided to proceed with the NBBJ architect firm. Over the next year they will carry out the design for the LKC (including the new facility, renovations and connecting elements) and, as part of the process, will be gathering input from our broader community. I will naturally provide updates on their progress – along with coverage in the Stanford Report – during the months ahead. I view this is the next stage in the important transformation of Stanford Medicine for the 21st Century.

Forecasting our Financial Future

To fully realize our strategic plan “*Translating Discoveries*” and our other big dreams, we have major needs that will have to be fulfilled over the next decade and beyond. This requires significant investments in facilities and programs that will enhance every facet of the School of Medicine and our missions in education, research and patient care.

Our ten-year facilities plan includes new buildings (the LKC and SIM1), renovation and seismic improvements of the 1959 complex (i.e., the Gale, Alway, Lane and Edwards buildings), as well as off-site facilities (including the Arastradero building, which requires considerable renovation, as well as the lease of additional research space to support departmental and institute needs). The high cost of construction in the Bay Area (which has only been rising) along with additional costs required by the University and county, results in a rather staggering price tag of \$544M (not including the costs for SIM2 and beyond), based on December 2005 estimates. It is important to note that this is quite an organic process and that many of the assumptions and projections are subject to change and modification. Because of the magnitude of these financial needs, we have done a comprehensive 10-year financial forecast that has been reviewed with the

President, the Provost and the University Finance Group, as well as the Provost's Budget Committee and the School of Medicine's Executive Committee. In particular, I want to thank Ms. Marcia Cohen, Interim Senior Associate Dean for Finance and Administration, and her team for a very thoughtful and comprehensive analysis – which has continued to be adjusted as new data become available that affirm or modify our underlying assumptions.

The important bottom line is that we think our capital and related plans are achievable as long as we are also successful in the continued growth of our major revenue sources (particularly sponsored research, clinical revenues, patent/royalty income, endowment earnings and, of course, fundraising) and as long as we are judicious and flexible in our management. You can certainly appreciate that each of these elements are subject to some volatility – as evidenced most recently by the downturn in NIH funding, for example. We also want to assure that our capital needs do not adversely impact on program development (the institutional equivalent of becoming “house poor”).

Key components of our strategy for the capital projects noted above include the use of short and long-term debt financing, philanthropic support, school and departmental reserves and resources and contributions from the University. The projected fundraising goal for facilities (which constitute less than 20% of the overall School of Medicine fundraising campaign goal) is approximately \$171M. We view this as a “basement level,” and we will endeavor to raise additional funds from private sources – recognizing that aspects of these projects, especially the infrastructure and renovation needs, are likely to be much less desirable to donors than other gift opportunities. Accordingly, we will complement the funding targets with debt financing (currently projected at \$169.5M), while recognizing that this carries a significant increase in our debt service payments – the equivalent of home mortgage payments. Because we plan to have the Dean's Office – and not departmental funds - handle the debt service—we have carefully projected our ability to meet these additional costs over the next decade and beyond. In doing so, we need to meet stringent university guidelines to assure that we can afford the debt servicing with a margin of financial security. I am pleased that we have been able to meet those important benchmarks. I am also pleased that our basic and clinical science chairs and leaders have agreed to help support these efforts, especially for the LKC, through the voluntary contribution of limited department reserves, by an increase in the infrastructure tax and by a five-year reduction in operating budget allocations.

Obviously we are embarking on a set of major initiatives that will help further transform the School of Medicine during the years ahead. Because of the magnitude of what we are seeking to accomplish – and the very substantial costs that will be borne as a consequence – I think it is imperative that you fully understand the scope of the activities we will be taking on. In sharing this financial forecast with you, I am also looking to each of you – and members of the Medical School and University community – to help us achieve the goals that will, I hope and believe, benefit you as well as future generations of students and faculty.

Getting the Facts On Animal Research

Over the years there have been numerous expressions by various groups about animal experimentation. As someone who spent his life doing research (that is, before a terminal but hopefully not apoptotic differentiation to becoming Dean), I have personally witnessed the ways in which appropriately conducted animal research can help shed light on important biological processes and ultimately result in tremendous advances in medical care – in my own case for serious childhood illnesses. While I respect the right of others to have different opinions about animal research, I am concerned when those feelings are expressed by threats, assaults or attacks – either verbally or on people or property. During the past several months several non-violent protests have been staged at the Medical School to express strong opinions about animal research at Stanford. Our Comparative Medicine Department and a number of our faculty have made important and meritorious efforts to provide information and address concerns that have been raised – and I thank them for their efforts. But some of the rhetoric surrounding these concerns is being expressed in more official communications – and not always with the greatest veracity. One recent exchange of this type included a commentary by Dr. Linda Cork, Professor and Chair of Comparative Medicine (published in the Feb 17th issue of the Stanford Daily). Because of its importance, I requested and received permission from Dr. Cork to print her commentary in the Dean's Newsletter as well, since I thought a wide audience of readers should see it. Dr. Cork writes as follows:

Matthew Liebman's opinion piece on animal research is misleading and distorts the facts. On Jan. 21, 2005, he and Claire Wagenseil spent more than two hours with me and the Attending Veterinarian for Stanford, toured Stanford's animal facility and learned in detail the way Stanford and its Animal Care and Use Committee and veterinarians work to protect animals in research, including rats, mice and birds. It now appears that Liebman's goal during the meeting and tour was to promote his own slant rather than present a fair and objective view of animal research at Stanford.

Contrary to Liebman's claims that regulations do not restrict actual experiments, the Animal Care and Use Committee of an institution reviews all uses of animals whether it is for teaching or research. This review occurs before animals can be purchased and is designed to insure animal welfare. Scientists who want to use research animals must describe in detail the purpose of the research, the value of the research, why animals must be used, and how the number of animals to be used was determined.

In addition, they must describe in detail all their procedures involving animals. If these procedures might cause the animals to experience more than momentary pain or distress, they are required to provide anesthetic or analgesic drugs to alleviate this pain or distress, or explain why these drugs or other treatments cannot be used to fully alleviate pain or distress. In case of the latter, the investigator will perform a literature search to document why pain and distress cannot be avoided.

More importantly, a scientist cannot simply claim "scientific necessity" to avoid the use of anesthetics or analgesics as Liebman claims, but this must be proven to

a skeptical group of scientists, veterinarians and nonscientists. The examples of "research" he gives are not credible.

Although the Animal Welfare Act excludes rats, mice and birds, the other federal agencies do not exclude these animals. Institutions which receive funds from federal agencies must file an Assurance with the federal government that they will abide by the Guide for the Care and Use of Animals and other federal regulations. The Guide has the force of law and spells out in detail the animal housing, sanitation, caging, veterinary care, etc. that laboratory animals must receive. Contrary to what Liebman says, the Guide includes all vertebrate species, including mice, rats, birds, frogs, etc.

The United States Department of Agriculture (USDA) is responsible for administering the regulations in the Animal Welfare Act and its revisions. USDA inspectors make unannounced inspections. During these visits, they review the animal care committee's work and visit all facilities where USDA-regulated species are held to actually see these animals and how they are being housed and treated. They will also conduct a detailed audit of records to insure that what the scientist tells the animal care committee will be done is actually taking place. USDA inspectors are thorough, and the USDA can fine institutions that fail to comply.

Unfortunately, the USDA has a limited number of categories for defining non-compliance, and these can be misleading - as was explained to Liebman during his visit. They also have no mechanisms for reporting or documenting the good work that is done to protect and insure the well-being of the animals. The USDA inspection reports and the records of the numbers of animals "used" at Stanford are available on the USDA web page. It is not a secret.

The Association for the Assessment and Accreditation of Laboratory Animal Care (AAALAC) is a voluntary organization that uses the Guide as its yardstick for evaluating the processes an institution uses to ensure quality laboratory animal care. Stanford University is proud to have been AAALAC-accredited since 1988. AAALAC's site visitors receive a description of the animal care program before they arrive; Stanford's AAALAC document is more than 200 pages in length. While at Stanford, site visitors, including experienced scientists and veterinarians, inspect how the animal care committee reviews animal protocols. They observe how facilities are maintained, visit all the animal facilities and check all records ranging from the way clinical cases are managed to whether the temperature at which cages are washed is appropriate. Although the AAALAC site visits are planned ahead of time, these visitors know how things are supposed to be managed and where to look for problems. Therefore, hiding problems would not be as easy as Liebman implies. Stanford University is proud to be AAALAC accredited, because it is considered the "Good Housekeeping Seal" of quality animal care.

Stanford has an excellent history of compliance. Federal animal welfare laws and regulations require an institution to self-report problems it discovers. Failure to

"self-report" is a violation. Stanford complies by self-reporting issues that arise; it does not try to hide problems from regulatory agencies. Yet, Liebman points to Stanford's compliance with this reporting requirement as evidence that it is noncompliant. On the contrary, it proves that Stanford takes its responsibility seriously and notifies federal officials promptly and investigates concerns about animal welfare.

Liebman opposes the use of animals in research - that is his privilege. But animal research enables millions of human beings to live healthier, more comfortable lives. Animal research led to treatments for diabetes, for vaccines for polio, measles, hepatitis, meningitis, pneumonia and other infectious diseases. At Stanford the late Dr. Norman Shumway used dogs to develop the techniques to transplant hearts and prevent immunologic rejection of transplanted organs. The list of accomplishments of animal research is extensive and has resulted in many Nobel prizes, both for understanding basic biologic processes and also for developing treatments for diseases.

Rejecting animal research means that we also reject learning how bodies function in health and disease, and it rejects developing treatments for AIDS, Alzheimer's disease, Parkinson's disease, SARS, influenza and a host of other yet-to-be discovered diseases. I don't believe that is what most human beings want for themselves or their families. Liebman knowingly misrepresents the animal care program at Stanford and nationally. Animal research at Stanford is carried out humanely with concern for the animals' welfare and for science of the highest quality.

Linda Cork, D.V.M., Ph.D., the Chair of the Department of Comparative Medicine and the Director of the Veterinary Service Center wrote this piece. She can be reached at lcork@stanford.edu

Physician Workforce Needs

I last wrote about the Physician Workforce projections from the AAMC in the September 19, 2005 issue of the Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/09_19_05.html#7). At the Administrative Board meeting of the AAMC (Association of American Medical Colleges) that I attended on February 15-16th, this important issue was revisited. The Task Force examining this important issue has evaluated the shortages of physicians being reported in an increasing number of states, including California, as well as the shortages in various specialties and subspecialties, including primary care physicians. Based on a number of important factors, including changing practice patterns and career choices (some influenced by gender and lifestyle), as well as the changing demography (including population growth, the aging population, age-related disease prevalence, shifts to ambulatory practice [now projected to increase by 24%], aging physician workforce, expanded activities by nurse practitioners, physician's assistants) significant increases in the physician workforce needs are projected beyond 2020 – perhaps beginning around 2016.

As I mentioned in the September 19th Newsletter, a major concern is that the pipeline of trainees in allopathic medicine has remained static while expansions in programs in osteopathic medicine are growing along with the “for-profit” off-shore medical schools, which are also significantly increasing in class size. Indeed, if the patterns are unchanged, the percentage of physicians in the USA who have been trained at LCME approved medical schools could fall below the majority in the years ahead – with potential serious impacts on both the face and quality of medicine. Based on these and other concerns, the AAMC’s Workforce Recommendations, which are under active discussion, include the following:

1. Total enrollment in LCME-accredited medical schools should be increased by 30% from the 2002 level over the next decade. This expansion should be accomplished by increased enrollment in existing schools as well by creation of new medical schools.
2. The aggregate number of graduate medical education (GME) positions should be expanded to accommodate the additional graduates from accredited medical schools.
3. The AAMC should take a leadership role to assist medical schools in expanding reenrollment in a cost effective manner; assure appropriate medical education for traditional and non-traditional students; and increase the number and improve the preparedness of applicants.
4. The AAMC should continue to advocate for and promote efforts to increase enrollment and graduation of under-represented minorities from medical school; and promote the education and training of leaders in medical education and health care from under-represented minorities.
5. The AAMC should examine options for development of: (1) a formal voluntary process for assessing medical schools outside the US; and (2) a mechanism for overseeing the clinical training experiences in the US of medical students enrolled in international medical education programs.
6. AAMC should take a more active role in supporting and assisting associations of medical schools in other countries, especially in less developed parts of the world. AAMC should work with its members to expand collaboration between medical schools and teaching hospitals in the US with those in less developed parts of the world.
7. Non-US citizen graduates of foreign medical schools entering GME programs in the US should be required to obtain a J-1 Visa.
8. National Health Service Corps (NHSC) awards should be increased by at least 1500 per year to help meet the need for physicians caring for underserved populations and to help address rising medical student indebtedness.

9. Studies of the relationship between physician preparation (i.e., medical education and residency training) and the quality and outcomes of care should be conducted and supported by public and private funding.
10. Ongoing and stable funding should be provided to track the physician workforce, including monitoring the supply of, and the demand for, and the contributions made by IMGs (International Medical Graduates)
11. The Association believes that the nation is best served by allowing individual graduates to determine for themselves which are of medicine they wish to pursue.

When I first learned about some of these findings and projections last year I asked the Medical Education group at Stanford to consider what our response should be to expanding our class size – at that time by 10-15% (and not the 30% now being advocated). Because of our current education facilities, faculty-student ratio and potential impact on financial assistance, the recommendation was to not expand the class size at this time. That said, the availability in the next 3-4 years of new and expanded education facilities as well as modest increases in faculty size and increases in endowment support for financial assistance will allow us to revisit this important question. Of course it must be recognized that the focus of our education programs is increasingly directed at training leaders and physician scholars, but, since these are also in short supply, Stanford will be in a position to complement another facet of the physician workforce requirement.

I should also quickly add that while the AAMC's workforce projections appear to have some validity, there are concerns about the recommendations being made; this was actively discussed at the AAMC Board Meeting mentioned above, and I am greatly interested in getting your reactions as well. For instance, if there is a significant change in the "system" of health care in this nation (which seems inevitable at some point in the not too distant future), the projections of the need for physicians, as compared to other health professionals, could be modified. In addition, I am also personally concerned that simply increasing the pipeline of physicians will not necessarily address the projected health care needs unless there is more stringent regulation of GME programs and career choice.

While it has been argued that the match between health care needs and training programs is best served by the market place, I would counter that this hasn't worked very well in the past as witnessed by the dramatic shifts in the perceived and actual needs for anesthesiologists, radiologists (among others) during the mid-1990's or the projections for primary care physicians. We have all witnessed the reactive nature of medical work force positions (e.g., the drive to cut specialists and increase primary care physicians in the early 1990's, which resulted in some serious shortfalls in the early part of the 21st Century). This underscores the importance of having a finer control over the size and scope of GME programs at the same time that medical school classes are being increased.

There are many other important issues that would need to be addressed concomitantly – including the rising indebtedness of medical education (which is a lesser, albeit still

significant, problem at Stanford), the balance of allopathic physicians vs. other medical professionals, the length of medical training among others. Clearly this is a topic that requires additional reflection and debate – and, as mentioned earlier, I welcome your comments.

More on the Impact of the Federal Budget

In the January 23rd issue of the Dean's Newsletter I reviewed the unfortunate events impacting NIH funding (see: http://deansnewsletter.stanford.edu/archive/01_23_06.html). Since then the President has issued his 2007 Budget proposal which, except for defense and homeland security, carries reductions or zero percent levels (which are actually losses when inflation is factored in) for a number of extremely important programs. By now you are aware of the recommendations concerning the NIH, but it is also worth noting the impact on other health programs and entitlements. The following table displays the sobering news:

Program	FY 2005 Actual	FY 2006 Appropriation	FY05-06 Variance	FY 2007 President's Budget	FY 06-07 Variance
<i>NIH</i>	\$28.653 B	\$28.587 B	-0.2%	\$28.587 B	0%
<i>Title VII</i>	\$300 M	\$145 M	-52%	\$10 M	-93%
<i>Title VIII</i>	\$151 M	\$150 M	-0.7%	\$150 M	0%
<i>AHRQ</i>	\$319 M	\$319 M	0%	\$319 M	0%
<i>Pediatric GME</i>	\$301 M	\$297 M	-1.3%	\$99 M	-67%
<i>NHSC</i>	\$131 M	\$127 M	-3.5%	\$127 M	0%
<i>CDC</i>	\$6.210 B	\$6.176 B	-0.5%	\$5.809 B	-5.9%
<i>VA Medical Care</i>	\$27.699 B	\$29.498 B	6.5%	\$33.075	12.1%
<i>VA Research</i>	\$402.3 M	\$427 M	6.1%	\$414 M	-3.0%
<i>NSF Total</i>	\$5.473 B	\$5.581 B	2.0%	\$6.020 B	7.9%
<i>NSF Research</i>	\$4.221 B	\$4.332 B	2.6%	\$4.666 B	7.7%

Traditionally the Congress has nearly always modified the President's budget before it becomes finalized. That said, there is considerable concern that the limited amounts of discretionary dollars will make the budget process much more challenging in FY07 and in the immediate years ahead than in the past. Indeed, if enacted as proposed, this would be the fourth consecutive year that the NIH budget failed to keep pace with inflation, as measured by the Biomedical Research and Development Price Index (BRDPI). Based on this Index, the NIH will have lost 9.3% of its purchasing power between FY2003 and FY2007. When inflation adjusted, except for NIAID [National Institute of Allergy and Infectious Diseases] (largely because of support for bioterrorism and Avian flu) and the Office of the Director (both of which would increase) the constant dollars available to

most institutes would be cut by 7.8% and 8.5% between FY2005 and FY2007. While it is hard to predict what this means for the numbers of competing research grants, it seems likely that the success rate for grants will decline from about 30% in FY 2003 to 19% in FY2007 – with all the attendant consequences. In my January 23rd Newsletter (http://deansnewsletter.stanford.edu/archive/01_23_06.html) I addressed some of the important advocacy issues that need to be addressed to help change or at least stabilize these disturbing trends.

The news is also potentially very serious for Title VII programs that support scholarships and support for disadvantaged students. Stanford has been successful in receiving such support for truly important programs that are now in serious jeopardy. This too is an area where major advocacy will be needed.

I also can't help highlighting the impact on GME support for children's hospitals that would take place under the Administration's budget proposal. This is an issue I worked on intensively when I was in Boston, and it is enormously distressing to see it become such a target, especially because of the potentially broader implications of a severe budget cut. Specifically, because independent children's hospitals (including LPCH) receive very little support from Medicare (with the exception of some payments for end stage renal disease), they traditionally received no support for GME – in contrast to adult teaching hospitals where both DME (Direct Medical Education) and IME (Indirect Medical Education) are contained within Medicare. Accordingly, during the mid to late 1990's children's hospitals across the country, along with the National Association for Children's Hospitals (NACH) carried out an effective campaign that by 2000 resulted in a special appropriation to provide GME support for children's hospitals. Like Boston and Massachusetts, the California contingent was active in the campaign, and our Congresswoman Anna Eshoo played an important role in the legislative process. While this has made a major difference for children's hospitals, the funding mechanism has remained in a separate bill (unlike embedding GME in Medicare) and is thus subject to the political process – as now being evidenced. Hopefully the Congress will see the wisdom of restoring this support to children's hospitals – but these events also demonstrate the vulnerability of GME writ large. Indeed, a few years ago there was a move to separate GME from Medicare, which could have similar consequences. That said, the challenges that are now being placed on Medicare almost certainly will rekindle the GME debate in the not to distant future.

Of course, the good news in the table above is the increased funding for NSF for physical and engineering sciences – which as I noted in previous Newsletters is most welcome and needed. But the lesson here should be to learn from the past rather than to repeat its errors. By under funding NSF over the years we have begun to lose our competitive edge in science and engineering. If we now under fund our prior investment in biomedical research, or support for programs that enhance the diversity of our workforce, or the ability to train future pediatric specialists (who are already in short supply), we will only weaken those investments in the immediate future. Clearly we need a more reasoned approach to our investments in biomedical research – something that will require our very concerted advocacy to help secure.

Stem Cell Research in California – What’s Coming

It has been 15 months since the California Institute for Regenerative Medicine (CIRM) was founded, thanks to the vote of nearly 60% of Californians for Proposition 71. And while litigation has prevented CIRM from accessing any of the \$3B of bonds that are contained in Prop 71, there has been considerable progress in CIRM and at least strong hope for the future.

On Friday February 10th Stanford hosted the most recent meeting of the 29-member ICOC (Independent Citizen’s Oversight Committee) to which I was appointed in early November 2004. At this recent ICOC meeting, Dr. Zach Hall, the President of CIRM, gave an update on what has transpired during the past year despite the many challenges that the ICOC and CIRM has faced. I would begin by stating that one of the accomplishments was finding and appointing Zach Hall to be the first President –he has done an outstanding job in my opinion. In turn he has appointed some very talented staff to support the CIRM, although this effort too has been limited by the financial constraints consequent to the ongoing litigation.

Among the additional positive accomplishments of the ICOC and CIRM have been the formation and appointment of members to the Working Groups for reviewing grants and developing standards. Indeed, outstanding individuals from across the country have been appointed to the grants review working group. In addition, policies for grants management have been developed along with policies for intellectual property, conflict of interest, and ethical standards for egg procurement. Furthermore, the ICOC carried out a statewide competition for housing the headquarters of the CIRM in San Francisco. In addition, last summer the CIRM and its Working Group reviewed applications for training grants, which were presented to the ICOC for approval. This was an impressive accomplishment, even though the grants remain unfunded at this time. Hopefully this will be addressed in the immediate future thanks to the Bond Advancement Notes (BAN) for which Mr. Bob Klein, Chair of the ICOC, is currently seeking private support.

The CIRM has been the center of international attention, and other nations are carefully observing its progress as well as its challenges. Indeed, as an exemplar of the standing of stem cell research in the USA it is notable that both the International Stem Cell Forum and a leadership group from the UK have asked California and CIRM to represent the USA in forging relationships to foster stem cell research.

Without question, the most important immediate issue facing the CIRM – and accordingly the immediate future of stem cell research in the USA – is the litigation that has challenged the constitutional authority of the State of California to issue the bonds that were voted for by a majority of Californians. Clearly this is a situation in which a minority of citizens is using the legal system to arrest the formation of CIRM. Currently, the trial for this litigation is set to begin on February 27th in Alameda. I, along with all of the ICOC members, have been deposed for this trial, and we are awaiting notice about whether we will also be called as witnesses. In part because of the national prominence of

this trial, the show “**60 Minutes**” is scheduled to do a piece on stem cell research in California that will feature work done at Stanford, UCSF and UC-Irvine. It is currently scheduled to air on Sunday evening February 26th.

Stanford Dance Marathon for Pediatric AIDS

Despite the progress in preventing maternal fetal transmission of HIV in developed nations, the prevalence AIDS in children and adults in developing nations remains alarming. In fact in 2005 nearly 5 million individuals were newly infected with HIV, with Sub-Saharan Africa continuing to bear the brunt of the infection. Programs to treat or prevent HIV infection in developing countries are being supported by the public and private sector. One organization that has played a long-standing role in this effort is the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF), a non-profit organization with which I have been involved since it was first formed in 1988. I am very pleased therefore that Stanford students decided to donate the earnings from the 2006 Stanford Dance Marathon to the work of the EGPAF. The 24-hour Dance Marathon began on Saturday afternoon February 18th and ended on Sunday February 19th. I had the opportunity to speak to the participating students on Saturday and to thank them for the commitment and contributions. I am personally grateful that they did not ask me to participate as a dancer! Although I am still running in 2-3 marathons a year, the very thought of dancing for even an hour (much less 24) moves me to apoplexy.

I should also add that in the otherwise grim portrait of AIDS in developing nations, some encouraging positive results have been recently reported in **Science** by Gregson et al (2006;311: 664-666) demonstrating a decline in HIV prevalence in eastern Zimbabwe between 1998-2003 – especially in young adults – due largely to changes in risky behavior. This is certainly encouraging news, which we can only hope will be sustained and extended to other countries.

HHMI Supports the Masters in Medicine at Stanford

In the December 12, 2005 Dean’s Newsletter I described the new Masters in Medicine Program that Dr. Ben Barres, Professor of Neurobiology and of Developmental Biology and of Neurology and Neurological Sciences, has put together. I am now happy to share with you the wonderful news that the Howard Hughes Medical Institute (HHMI) has selected Stanford as one of its awardees for programs that combine Medicine and Science. Because HHMI wants to shorten the time it takes to translate basic science discoveries into new medical treatments by challenging graduate schools to change the way students are trained, it has awarded \$10 million to fund 13 innovative graduate programs that will introduce Ph.D. students to the world of clinical medicine. Stanford is one of the programs selected – thanks largely to the efforts of Ben Barres.

In the announcement of the awardees, Dr. Tom Cech, President of HHMI, noted “*We, like many others, are concerned by how difficult it is becoming for scientists to harness the explosion of new biomedical research information and translate it into medical practice. At a time when science and medicine must work hand in hand to solve problems*

of human health and disease, we want to help change graduate education to increase the pool of scientists who are doing medically oriented research.”

The goal of this new HHMI program is to produce researchers who have the knowledge and skills to address clinically important biological problems from the perspective of basic science. HHMI received applications from 82 institutions and a distinguished panel of graduate educators, biomedical researchers, and physician scientists helped in selecting the awardees. Graduate students will earn certificates or Master's degrees in molecular medicine, translational medicine, or medical science, in addition to their Ph.D. The additional coursework and clinical mentoring will prepare them to understand the symptoms, treatments, and unmet needs of patients whose underlying disease mechanisms they may be studying.

Please join me in thanking Ben Barres.

Striking the Right Balance

Dr. Margaret (Minx) Fuller, Professor and Chair of Developmental Biology, shared some news with me that clearly seem to strike the right balance. At the next annual meeting of the American Society of Cell Biology, eleven of the 22 invited plenary speakers are women scientists – all highly regarded. In addition, of these 22 speakers, three are from Stanford –Lucy Shapiro, Minx Fuller and David Kingsley. The ASCB seems to be finding the right balance (of course including the numbers of Stanford speakers) – something that other societies should emulate!

Medical Student Authors

At last week's Winter Writers Forum, the Stanford community celebrated the publication of two books by Stanford medical students. Shannon Moffett's book, "The Three Pound Enigma: The Human Brain and the Quest to Unlock Its Mysteries," and Joshua Spanogle's medical thriller, *Isolation Ward* were featured at this meeting. Both students received Stanford Arts and Humanities Medical Scholars grants. Congratulations to both Shannon and Joshua for their respective accomplishments!

Medical Students Lead Initiative on Fertility Issues in Childhood Cancer Treatment

Their collaboration began in anatomy and led to a research project and presentation at Pediatric Grand Rounds on Friday February 17th. Second-year Stanford medical students Tess Goodwin and Elizabeth Oosterhuis began exploring the approach to fertility planning by pediatric oncologists – along with the perceptions of this issue by patients and families. In addition to presenting their interesting findings, they put together a valuable resource package entitled "Fertility Issues In Childhood Cancer Treatment". Tress and Liz have done a most impressive job. Congratulations!

A Message From Dr. Marilyn Winkleby, Faculty Director of the Community Partnership.

We are pleased to announce the official launch of the Office of Community Health (OCH) website at <http://och.stanford.edu>. The Office of Community Health (OCH) was

created to institutionalize, expand, and sustain the School of Medicine's community partnerships, and to support student and faculty engagement in meeting the self-identified needs of underserved populations.

Since we began a few months ago, we have strengthened our partnerships with nine local community organizations and developed community health assessment and advocacy projects in which over 100 medical students and 20 undergraduate students are engaged. Nearly all of these projects address health concerns in underserved and low-income populations. Each fall we host the Annual Fall Forum in Community Health and Public Service; last year 36 medical student and undergraduate projects in community and international health were showcased and the event was attended by approximately 200 students, faculty, and community members.

In the next several years, we expect the OCH to play an essential role in enhancing the culture of service and civic engagement at Stanford, and in meeting the School of Medicine's mission to promote "the humane and caring practice of medicine and a sense of obligation to improve the health of the public."

Our new website will enable us to serve as a central source for information on Stanford's community health partnerships and linked academic programs, as well as student and faculty research and service activities in community health.

We will continue to refine and enhance the site in the coming months. All comments and suggestions are welcome!

Nominees Sought for Hewlett Award

The Albion Walter Hewlett Award was developed by the Department of Medicine as a recurring award to honor an extraordinary physician with ties to Stanford. Nominees are welcome from all departments and are not confined to the Department of Medicine. The award committee invites your nomination for a possible award presentation in 2006. Nominees should be from among those living who have made a substantial investment in Stanford (past or present students, house officers, fellows or faculty) and who have consistently, over decades, demonstrated the exemplary combination of a scientific approach to medicine and sensitivity to patients. They should be consummate physicians and role models for future academicians in medicine. Their work should be well known at least at Stanford and, optimally, nationally. Nominations are due by March 6, 2006. For more information please check out the website at <http://medicine.stanford.edu/hewlett/>

Awards and Honors

- ***Richard Chiu (SMS II)*** won the Klea D. Berakis Award for the top presentation at the Western Medical student Research Forum. Approximately 500 students presented! Richard's presentation was entitled "Polymethylmethacrylate Particles Inhibit Osteoblastic Differentiation of Bone Marrow Progenitor Cells in Vitro" His advisor is Dr. Stuart Goodman, Professor of Orthopedic Surgery. Congratulations to Richard.

- **Dr. Gary Glover, Professor of Radiology and Director Radiological Sciences Laboratory**, is one of 76 scientists elected to the National Academy of Engineering on February 10th *“For research and engineering in the development of computed tomography and magnetic resonance imaging”*. As noted in the Academy’s press release, “election to the National Academy of Engineering is among the highest professional distinctions accorded to an engineer. Academy membership honors those who have made outstanding contributions to "engineering research, practice, or education, including, where appropriate, significant contributions to the engineering literature," and to the "pioneering of new and developing fields of technology, making major advancements in traditional fields of engineering, or developing/implementing innovative approaches to engineering education." Congratulations to Dr. Glover!

Virginia Fowkes, FNP,MHS, Senior Research Scholar in the Center for Education in Family and Community Medicine received an award from the State of California's Healthcare Workforce Policy Commission, acknowledging her 30 years of service to primary care and the work of the Commission in California. Congratulations to Virginia.

In the last Newsletter we announced that two Stanford MD students - **Yashar Kalani and Dora Castaneda** -- have just been awarded Soros Fellowships. We are proud to announce that two additional Stanford MD students – **Achal Achrol** (born in Kaipur, India) and **Gabriel Brat** (born in Israel to Argentine parents) have been awarded Soros Fellowships. Congratulations to Achal and Gabriel!

Myriam Curet, Associate Professor of Surgery (General Surgery) at the Stanford University Medical Center, has been chosen as a recipient of this year’s Association for Surgical Education’s Outstanding Teacher Award. The award is presented annually by the Association for Surgical Education to recognize the dedication of surgical educators. It is meant to reward teaching excellence and to further emphasize teaching as an important area of academic expertise. She has been selected to receive this award because of her dedication to and excellence in surgical education. Congratulations, Myriam.

Out of 22 entries, **Stanford Medicine** has received the top award – the Award for Excellence – from the AAMC in the category, External Audience Periodicals. Congratulations to Paul Costello and his staff for an excellent publication!

An endowed professorship is one of the highest honors bestowed on a member of the faculty, and we would like to congratulate the following:

David N. Cornfield, M.D., has been appointed as the first holder of the Anne T. and Robert M. Bass Professorship in Pediatric Pulmonary Medicine in the School of Medicine.

Kenneth I. Weinberg, M.D. has been appointed as the first holder of the Anne T. and Robert M. Bass Professorship in Pediatric Cancer and Blood Diseases in the School of Medicine.

Norman W. Rizk, M.D., has been appointed as the Berthold and Bell N. Guggenhime Professor in Medicine in the School of Medicine.

Beverly S. Mitchell, M.D., has been appointed as the George E. Becker Professor in Medicine in the School of Medicine.

Congratulations to all of you, and thank you for your contributions at Stanford.

Appointments and Promotions

- **Amin M. Al-Ahmad** has been appointed to Assistant Professor of Medicine (Cardiovascular Medicine), effective 2/01/06.
- **Martin Angst** has been promoted to Associate Professor of Anesthesia, effective 2/01/06.
- **Ramsey Cheung** has been reappointed to Associate Professor of Medicine (Gastroenterology & Hepatology) at the Veterans Affairs Palo Alto Health Care System, effective 12/01/06.
- **Rajinder K. Chitkara** has been reappointed to Associate Professor of Medicine (Pulmonary and Critical Care Medicine at the Veterans Affairs Palo Alto Health Care System, effective 3/01/06.
- **Waldo Concepcion** has been appointed to Associate Professor of Surgery, effective 2/01/06.
- **Soheil Dadras** has been appointed to Assistant Professor of Pathology and Dermatology, effective 2/01/06.
- **Ricardo Dolmetsch** has been reappointed to Assistant Professor of Neurobiology, effective 3/01/06.
- **Lawrence V. Hoffman** has been appointed to Associate Professor of Radiology, effective 2/01/06.
- **Gloria M. Kardong** has been promoted to Adjunct Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 2/01/06.
- **David P. Lee** has been reappointed to Assistant Professor of Medicine (Cardiovascular Medicine), effective 4/01/06.

- **Meritt Maduke** has been reappointed to Assistant Professor of Neurobiology, effective 9/31/06.
- **Darius Moshfeghi** has been reappointed to Assistant Professor of Ophthalmology, effective 8/01/06.
- **Andrew Shelton** has been reappointed to Assistant Professor of Surgery, effective 2/01/06.
- **Mark A. Singleton** has been promoted to Assistant Professor of Molecular and Cellular Physiology, effective 9/31/06.

Dean's Newsletter

March 6, 2006

Tribute to a Stanford Pioneer

A special memorial service to celebrate the life of Norman Shumway, MD, PhD, who passed away on February 10 at the age of 83, will be held on **Friday, March 17** at Stanford Memorial Church. Services will start at 3 pm, followed by a reception at the Stanford Faculty Club, 439 Lagunita Drive, at 4 pm. Seating is limited, so please arrive early. Free parking will be available at the Stock Farm West parking lot. A shuttle to the church and back will run between 2-6 pm. If you have questions or special needs, please call 234-0621.

As you know, Dr. Shumway was one of the most remarkable figures in American Medicine during the 20th century. He was an incredible visionary, leader and pioneering surgeon. His work transformed cardiothoracic surgery and had a major impact on Stanford Medicine – locally and globally. While he is surely missed, his legacy will continue deep into the future.

Should you wish to make a contribution in his memory, the family asks that you please make a donation to the Stanford Heart and Lung Transplant Patient Care Fund, Department of Cardiothoracic Surgery, 300 Pasteur Drive, Stanford, CA 94304-5407.

Continuing On

You may have noted in the recent issue of the **Stanford Report** (<http://news-service.stanford.edu/news/2006/march1/pizzo-030106>) that President Hennessy and Provost Etchemendy asked me to serve a second term as dean of the School of Medicine.

I am honored to accept their invitation and will do my best to continue serving the School, Medical Center and University.

It is hard for me to imagine that in April I will have been in my role for 5 years. In many ways it has been a time of considerable change and progress, thanks to the efforts and contributions of extraordinary faculty, students and staff. I have been most fortunate to work with a remarkable leadership group in the dean's office, along with exceptional department chairs and senior leaders throughout the School. I am particularly pleased that our Stanford community has drawn more closely together with the common goal of fostering discovery and innovation to improve human health and that we have forged a closer relationship with our colleagues across the University.

I began my tenure as dean at a time when the medical school was just emerging from the challenging merger and de-merger with UCSF – a period of low morale, damaged image and financial difficulty. Fortunately we were able to unite under the banner of ***Translating Discoveries*** and together redefine and then better align our missions in education, research and patient care. Today we are considerably stronger and healthier – and have a clear sense of mission and purpose.

There is no question that we have many challenges ahead and that some of the progress we have made will be impacted by forces within and outside of the medical center. But I am confident that we can – indeed must – play a leadership role in better defining the future of academic medicine and its value to our community locally and globally. I will do all that I can to help Stanford achieve the greatest success possible and both appreciate and count on your continued support – and especially your creativity, energy and commitment to Stanford Medicine.

And finally, I guess this means that the Dean's Newsletter will continue on – at least for the next 5 years!

Thinking Globally

We are increasingly part of a global community that is being radically transformed by technology, transportation, economics, and of course disease and global health. While Thomas Friedman's widely read "***The World is Flat. A Brief History of the Twenty-First Century***" (Farrar, Straus, Giroux, 2005) illustrates how technology is equalizing the economic playing field for a number of nations, it is also clear that there are widening divisions between technology- wealthy nations and those that remain poor and impoverished. That said, these divides can be crossed and seriously impacted by emerging infections – including the prospect for a global pandemic such as with Influenza H5N1. Preparing for such events is essential – but so too is achieving more harmonious partnerships with global partners.

The recently announced Freeman Spogli Institute for International Studies (see <http://fsi.stanford.edu/>) offers a unique opportunity for Stanford to define its role and place on the world stage. To better delineate the role that the School of Medicine should play in international programs I brought together a group of faculty and students to help

define our future directions. This is a work in progress but I want to share some of our interim observations with the hope of getting feedback from you. Among the major working principles are:

- ***Alignment with strategic goals of the School of Medicine.*** While we will continue to foster individual faculty and student international initiatives, it is important that broader efforts be as aligned with the mission of the School of Medicine as possible. Our strategic plan, *Translating Discoveries* defined the mission of the Stanford School of Medicine *to be a premier research-intensive school of medicine that improves health in the 21st century through discoveries, leadership, and innovation in education, biomedical research and patient care.* Accordingly, whatever new initiatives we undertake in the international area should be consistent with our core mission and values – which emphasize discovery and innovation.
- ***Alignment with the Stanford University International Initiative.*** We are in an exciting era of interdisciplinary research with the noteworthy potential of the application of research discoveries to real world problems. Because of its relatively small size and porous inter-departmental and inter-School boundaries, Stanford has the potential to make significant advances in addressing pressing needs on a global scale – including in global health. However, this can only be done if faculty and students across all the schools come together, and accordingly, we are enthusiastic about participating in and fostering alignments across the university.
- ***Focus on basic research and innovation.*** Our great strength lies in innovation and discovery that evolves from basic research. The committee concluded that at least one venue that has the potential to engage international team efforts could be modeled on the exciting Biodesign Program that has been pioneered at Stanford by Dr. Paul Yock, Martha Meier Weiland Professor and Co-Chair of the Department of Bioengineering. As currently delineated, the Biodesign program fosters interdisciplinary teams charged with identifying specific problems and designing solutions to them, and thus might provide a paradigm to anchor new international efforts. Indeed, creating teams that include participants from Stanford and other nations could provide an important linkage between *Translating Discoveries* and improving global health. There could also be alignments with scholars of policy and policy makers that might be very beneficial.
- ***Geographic focus.*** Our working committee also noted that we would have the greatest impact if we focus our efforts geographically. In this regard, we are looking at Asia, specifically at India and China. These areas have enormous need and significant potential for progress through the kind of interdisciplinary, problem-based approach at which Stanford science excels, coupled with the policy expertise that Stanford scholars can bring to bear.

- ***Enhanced and guided student experiences.*** It has been clear for some time that we need to provide greater coordination and oversight of student international experiences. In addition, we want to build on the strong student interest in international medicine so that we can offer them a greater array of opportunities. Again, the Biodesign model might provide one paradigm, but other approaches will also be entertained.
- ***Identification of a leader.*** In order to bring a plan to fruition, we need to identify a senior leader. The “phenotype” of this leader is yet to be determined – i.e., whether we should seek a senior scientist in an area such as infectious diseases or whether this position calls for an individual who has significant experience and accomplishment in the arena of international health policy. The question is: where should the area of deepest knowledge reside – in laboratory science, in the translation of basic science to clinical application, or in the broader world of public health applications and policies? Regardless of how we resolve this question, we will be looking for an individual who can move the agenda forward internally as well as externally. This will include such elements as: mobilizing faculty and student interest within the school, engaging faculty interest in other Stanford schools and at the Freeman Spogli Institute, developing a strategic plan for School international efforts, establishing an office that oversees and enhances student international experiences, leading the efforts to establish new international projects and collaborations, and so forth.

There are exciting opportunities and challenges before us – but clearly they are ones that we should wish to address. Please let me know your ideas. My plan is to move our agenda to a new level in the months ahead.

Commonwealth Club Award for Stem Cell Research

On Wednesday evening March 1st the Commonwealth Club of California presented their 18th Annual Distinguished Citizen Award to institutions and individuals for achievements in life science, biotechnology and stem cell research. Stanford and UCSF were the two institutions that were honored along with Brook Byers, Bob Klein and Bill Bowes. Dr Irv Weissman, Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine and Virginia & D.K. Ludwig Professor of Pathology accepted the award for Stanford.

In honoring the scientists and leaders in California who have been pioneers in the still nascent field of stem cell research, the Commonwealth Club also offered an important affirmation in support of this important area of investigation, which has, unfortunately, remained unfunded in California due to lawsuits challenging the constitutional right of the State to issue the bonds - despite the approval of nearly 60% of the voters of California in November 2004. Ironically, on the same day of this award ceremony, the trial challenging the right of the state to issue the bonds that voters approved in Proposition 71 was proceeding in the Alameda County Court under the guidance of Judge Sabraw. While a 2-3 week trial was anticipated (the plaintiff indicated that they would call over 70 witnesses) the actual trial lasted only three days and virtually all reports

indicate that the plaintiff's case was quite weak. An opinion piece on this topic by Russell Korobkin, Professor of Law at UCLA and a senior fellow at the UCLA Center for Society and Genetics, which you may find of interest, was published in the March 3rd LA Times (see: <http://www.latimes.com/news/opinion/commentary/la-oe-korobkin3mar03,1,7368002.story>).

It is expected that Judge Sabraw will render her decision within the next several weeks. It is also anticipated that if the decision is against the plaintiff they will appeal the decision to a higher court – but hopefully the case will be dismissed or negated on appeal. With that the funds approved by the voters of California will become available.

As you may know, I have been a member of the Independent Citizen's Oversight Committee (ICOC), which has overseen the California Institute for Regenerative Medicine since its inception in November 2004. The ICOC has worked tirelessly on behalf of the State of California to get the systems into place to support high quality stem cell research. In my opinion remarkable progress has been made, and it is a tragedy that at this point we are still unable to carry out the wishes of the voters by funding and supporting stem cell research. I hope that this will soon change and that the important science that can and must be done has the opportunity to proceed.

More From 60 Minutes

Hopefully many of you had the opportunity to see the segment about stem cell research on the 60 Minutes show that aired on Sunday February 26th. Dr. Bobby Robbins, Chair of Cardiothoracic Surgery and Director of the Stanford Cardiovascular Institute, did a terrific job in representing his research and Stanford (see <http://mednews.stanford.edu/stemcell-60min.html> for details).

Unfortunately, because the producers of 60 Minutes decided that they needed to devote more time to the port authority issue, they eliminated the interview they had done with Dr. Irv Weissman – which was most unfortunate. However, they have now posted that interview on their website and if you are interested you can view it at: <http://www.cbsnews.com/stories/2006/02/23/60minutes/main1341635.shtml>.

Stanford Receives Major Award for Nanotechnology

The National Cancer Institute has awarded Stanford University a \$20,000,000 U54 grant to establish a Center of Cancer Nanotechnology Excellence (CCNE) (http://nano.cancer.gov/funding/nanotech_centers_of_excellence.asp). This grant is an excellent example of team-based science. It involves the Schools of Medicine, Engineering, and H&S as well as investigators from UCLA, Cedars Sinai, Fred Hutchinson, UT Austin, General Electric and Intel. Dr. Sam Gambhir, Director of the Molecular Imaging Program at Stanford (MIPS) (<http://mips.stanford.edu>) and Professor of Radiology and Bioengineering, is the Principal Investigator.

The grant will focus on bringing together *in vitro* diagnostics and *in vivo* molecular imaging to develop strategies to monitor patients undergoing cancer therapy. The goals are to develop novel strategies based on nanosensors (magneto and nanotube) for looking

at early changes in blood proteins after therapy and to develop nanoparticles (e.g., quantum dots) for molecular imaging, also to monitor responses to therapy.

In addition to Sam Gambhir, a number of Stanford investigators are involved in this project, including: Hongji Dai of the Department of Chemistry; Rob Tibshirani of the Departments of Health Research & Policy and of Statistics; Michael Kelly, Bob Sinclair and Robert Wilson of the Department of Materials Science and Engineering; Dean Felsher and P.J. Utz of the Department of Medicine; Garry Nolan of the Departments of Microbiology & Immunology and of Molecular Pharmacology; Xiaoyuan Chen, Samira Guccione, David Paik, Sylvia Plevritis, Jianghong Rao and Meike Schipper of the Department of Radiology, and Ed Myers, Yoshio Nishi and Mary Tang of the Stanford Nanofabrication Facility.

Congratulations to Dr. Gambhir and his collaborators.

Graduate Student Selection Weekend

March 1-5th is the Annual Graduate Student interview and selection weekend for students interested in Stanford's Bioscience programs. These include 12 home programs that are either departmentally based or are interdisciplinary programs – along with programs in biomedical informatics and bioengineering. The 2005-06 Biosciences Brochure which describes these programs can be downloaded from the PhD Program website (see: <http://med.stanford.edu/phd/>).

Based on a review of applications submitted in December, approximately 250 applicants were invited for interviews over this past weekend. From everything I have heard so far, the students who visited Stanford were outstanding. Each of the programs and departments will be finalizing their selections and offers for the 2006 incoming class will be delivered to students early this week. In addition to being outstanding candidates I was also pleased to note the diversity of the individuals who visited Stanford and am hopeful that this next class will be outstanding and diverse.

Commission on Graduate Education -- Report Available Online

The report of the Commission on Graduate Education (see Dean's Newsletter http://deansnewsletter.stanford.edu/archive/10_04_04.html#4) can now be downloaded from the President's website (<http://www.stanford.edu/dept/president>). Hard copies of the report also may be requested on a limited basis by contacting Miranda Tuttle at mtuttle@stanford.edu (the report will be sent via ID mail).

President John Hennessy formed the commission in 2004 to study possible enhancements to graduate education at Stanford. Drs Julie Parsonnet, Senior Associate Dean for Medical Education and Dr. John Boothroyd, then Senior Associate Dean for Research and Graduate Education, represented the School of Medicine on this effort. The commission presented its report to the Faculty Senate in December 2005 and made a number of recommendations to enhance multidisciplinary opportunities to expand leadership training and break down institutional barriers to encourage collaboration among departments.

President Hennessy announced recently that the university would adopt the commission's recommendation to create the position of vice provost for graduate education to oversee many of the reforms. The university also has approved the development of three new pilot programs for graduate students that incorporate some of the recommendations of the commission.

Asian Pacific American Medical Student Association (APAMSA) Meeting

On Saturday, March 4th the 2006 APAMSA Western Regional Conference that was jointly sponsored by Stanford and UCSF was held in Cole Hall at UCSF with more than 150 medical students from California and beyond in attendance. I was pleased to be invited to provide opening remarks on behalf of Stanford - and to recognize the breadth and depth of the program that had been assembled. The Conference was entitled "Taking Action: Responding to the health needs of the Asian Pacific American Community," and it featured a broad array of topics ranging from social justice and protecting patients to the impact of Hepatitis B and HIV.

Special thanks must go to our Stanford students who helped organize this excellent conference including Emiley Chang (who served as co-chair) along with Organizing Committee Members Rena Patel, Andrew Poon, Kaushik Roy, Ricky Tong and Wei Gu.

Promoting Diversity and Leadership

The first session of the Faculty Fellows Program organized by the School of Medicine's Office of Diversity and Leadership met on Tuesday evening, February 28th in the Faculty Club. Participants had the opportunity to attend sessions dealing with such important practical issues as journal writing and mentoring – and also had the opportunity to get to know each other. One feature of each of these sessions will be a personalized description of the leadership journey of various Stanford faculty and leaders. I had the privilege of giving the first of these sessions.

I again want to thank the leaders of this important effort including Dr. Hannah Valantine, Barbara Miller and Julie Moseley.

Stanford Medicine, Spring Issue

The Spring issue of Stanford Medicine offers a special report on pediatric challenges. Its underlying message is that for many children good health care is the exception, not the rule, despite the extraordinary advances being made in pediatric care.

This print run is the publication's largest in a decade: 65,000. The run's size is due to an additional 50,000 printed for LPCH, which is planning to distribute the issue widely among pediatricians and the media.

Highlights in this issue include:

- The lead story discusses the struggle for pediatric health-care funding. It refers to this year's outrageous "Deficit Reduction Act" and describes the tendency for legislation to favor adults vs. kids.

- A piece on the dire straits facing pediatric health workers (and children) in sub-Saharan Africa. Media relations director Ruthann Richter traveled to Kenya and interviewed health-care workers, children and families there.
- -A feature on the history of children's hospitals, their importance, and their precarious financial footing. This includes a sidebar on LPCH's origins.
- -A "ticktock" of the days leading up to Children's Hospital New Orleans' evacuation in the wake of Hurricane Katrina. Two LPCH residents put us in touch with a resident there. He provided a diary of his experiences. The hospital's leaders provide context.

The Stanford Medicine magazine may be viewed online at:

<http://mednews.stanford.edu/stanmed/2006spring/> . Hard copy of the issue may be obtained by contacting the Office of Communication and Student Affairs at (650) 723-6911.

Call for Nominations

Nominations are now being accepted for the 2006 Alwin C. Rambar-James B.D. Mark Award for Excellence in Patient Care. Nominations are open to all Stanford physicians, regardless of whether they work at Stanford University Hospital and Clinics, Lucile Packard Children's Hospital, or any other location where a Stanford physician is delivering care. The Award, which is presented at Medical School Commencement, was established in 1984 to recognize and honor a Stanford physician who excels in patient care, exemplified by his or her ability to meld competence with compassion, and who works productively with all members of the health care team. Last year's recipient was Dr. George Fisher.

Please submit your nomination for the 2006 award to Lisa Joo, Medical School Office Building, 251 Campus Drive, Room XC041, Stanford, CA 94305-5460 or by email at lisa.joo@stanford.edu. Nominations are due by April 10, 2006.

Awards and Honors

- The School of Medicine has been awarded the ***Diversity Spirit Achievement Award (2006)*** from the Diversity Recruiters Network (DRN) for its active support of Diversity in the Community and the Workplace. This is a national awards program that recognizes organizations for their accomplishments and outstanding support of diversity in the workplace and community. The School of Medicine was one of only two Bay Area employers honored in a recent presentation ceremony. Nancy Koski, HRG's Compensation and Employment Specialist, accepted this award on behalf of the School of Medicine. Special thanks to our Department of Human Resources.
- ***Dr. Sanjiv "Sam" Gambhir***, Professor of Radiology and Director of the Molecular Imaging Program at Stanford (MIPS), was recently in London where

he received the prestigious Hounsfield Medal for his work in Molecular Imaging. This medal is named after Sir Godfrey Hounsfield, who received the Nobel Prize for Medicine in 1979 for his work on developing computer-assisted tomography (CAT scanning). Dr. Gambhir's research focuses on multimodality molecular imaging with an emphasis on novel strategies for cancer diagnostics and management. Congratulations to Dr. Gambhir for this honor.

- **Dr. Michael Longaker**, the Deane P. and Louise Mitchell Professor has been elected President Elect of the Society of University Surgeons – a wonderful accolade for Dr. Longaker.
- **Dr. Tom Krummel**, the Emile Holman Professor and Chair of the Department of Surgery at SUMC and Susan B. Ford Surgeon-in-Chief at LPCH was elected the Secretary Treasurer of the prestigious Halstead Society. He will serve a 3-year term and then become Vice President, and in 2009-10 he will serve as President. Congratulations to Dr. Krummel.

Appointments and Promotions

- **Subbhas Banerjee** has been reappointed to Assistant Professor of Medicine (Gastroenterology and Hepatology) effective 3/1/06.
- **Stephanie Chan** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 12/1/2005.
- **Michael Harbour** has been promoted to Clinical Associate Professor of Medicine, effective 3/1/2006.
- **Peter Henry Johannet** has been promoted to Clinical Assistant Professor (Affiliated) of Surgery, effective 5/1/2005.
- **Sanjay Kurani** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 12/1/2005.
- **Christopher Longhurst** has been promoted to Clinical Assistant Professor of Pediatrics, effective 2/1/2006.
- **Frank Longo** has been appointed to Professor of Neurology and Neurological Sciences, effective 3/1/06.
- **Robert Menard** has been promoted to Clinical Assistant Professor (Affiliated) of Surgery, effective 5/1/2005.
- **Andrew B. Nevins** has been promoted to Clinical Assistant Professor of Medicine, effective 3/1/2006.

- **Tom Ormiston** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine effective 12/1/2005.
- **Mark A. Singleton** has been promoted to Adjunct Clinical Professor of Anesthesia effective 2/1/06.
- **Laszlo Vaszar** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 1/1/2006.

Dean's Newsletter

March 20, 2006

Dr. David Stevenson Appointed Vice Dean

I am very pleased to announce that Dr. David Stevenson, Senior Associate Dean for Academic Affairs, has accepted my invitation to take on the additional role of Vice Dean of the School of Medicine. It has been my privilege to work closely with Dr. Stevenson since my arrival at Stanford five years ago. He has done a wonderful job in his current role and has led initiatives that have resulted in significant improvements in the organization and responsibilities of the professoriate, in improved clarity around the appointments and promotions process, and in a heightened commitment to enhancing diversity and improving the quality of life of our faculty and staff. He has also played a pivotal role in dealing with challenging faculty issues – and has done so with a sense of fairness and transparency.

As we build on the agenda of Translating Discoveries that we have developed during the past several years, it is clear that a focused effort is needed to bring all of our plans to realization. Dr. Stevenson will work even more closely with me to help this happen and to meet the important challenges we face in such areas as aligning the medical center, furthering the development of the Stanford Institutes of Medicine, supporting and developing additional leaders and improving our connectivity with the University. These challenges will be even more notable as we embark on an ambitious capital campaign in the next several years. It goes without saying that Dr. Stevenson has a deep love and commitment for Stanford and a strong desire to help our School, Medical Center and University succeed in every way possible. I look forward to working even more closely with Dr. Stevenson and I am very pleased that he is willing to take on even more responsibilities.

Please join me in congratulating Dr. Stevenson in his new role as Vice Dean and Senior Associate Dean for Academic Affairs.

Match Day 2006

On Thursday, March 16th, at the same time across the nation (corrected, of course, for geographic time zones), more than 15,000 graduates of US allopathic medical schools

opened their envelopes to find out where they “matched” and would begin their residency training this summer. Approximately 94 Stanford students participated in the 2006 Match. Overall some 26,715 applicants participated in this year’s match, which is run by the NRMP (National Residency Match Program). 11,707 of these were physicians who had already graduated from medical school or students from osteopathic or non-USA schools. The latter group has been increasing, as I noted in a recent Dean’s Newsletter story regarding the relative decrease in graduates from allopathic schools of medicine (see http://deansnewsletter.stanford.edu/archive/02_21_06.html#7).

Overall, internal medicine attracted the largest number of graduates (22%). An important trend seems to be changing in general surgery since all but one of its positions nationally were filled. This was the first year for a match in Otolaryngology. As in recent years “lifestyle” specialties fared well with all dermatology positions filled (93% from USA medical schools), and anesthesia had 97% of its positions filled. In contrast, primary care specialties have shown declining interest in recent years.

Looking nationally, 84.6% of students matched to one of their top three program choices (60.1% to their first choice). At Stanford, our still preliminary data show that 92% matched to one of their top three choices and 80% of our graduating students matched to their top choice – which is quite excellent.

The top residency selections among our Stanford students include Internal Medicine (19.6%), Pediatrics (11.9%), Emergency Medicine (7.6%) and General Surgery and Orthopedic Surgery (each at 6.5%). In the aggregate, 33.7% of our graduates have chosen residency training in Internal Medicine, Pediatrics or Med/Peds programs, and 29.3% chose General Surgery or Surgical Specialty programs.

The list of residency programs to which our Stanford students matched (for those who agreed to share their results) follows. Please join me in congratulating all of our students – who will graduate in 90 days!

Stanford University School of Medicine
2006 Residency Match Results

Adams, Winifred	Stanford Univ Progs-CA	Urology

In addition to the match results for our graduating medical students I am also pleased to note that all of the residency programs affiliated with Stanford Hospital & Clinics and the Lucile Packard Children's Hospital were also very successful. So overall, Stanford fared exceedingly well in the 2006 Match!

Support for the NIH: Specter and Harkins Rise to Advocacy

In recent newsletters I have addressed with considerable concern the funding challenges that NIH and, as a result, extramural researchers are facing in a difficult federal budget environment (see http://deansnewsletter.stanford.edu/archive/01_23_06.html#1 and http://deansnewsletter.stanford.edu/archive/02_21_06.html#7). As I discussed in the January 23, 2006 Newsletter, this fiscal year NIH is operating under a budget that is slightly below last year's funding level. This represents the first funding cut NIH has experienced in over three decades. Furthermore, this year's budget continues a trend that has brought a third consecutive year in which NIH is funded at a level significantly below the Biomedical Research and Development Price Index (BRDPI). As many of you know, this circumstance has tangibly impacted researchers across the country. At Stanford we are trying to ameliorate the situation as best we can.

Last month the President presented Congress with a budget that recommended flat funding for NIH in the next fiscal year. In response, Senator Arlen Specter (R-PA) and Senator Tom Harkin (D-IA), with the support of both of our California Senators, proposed and fought for an amendment to add \$7 billion to the Senate Budget Resolution to increase funding to health and education programs that did not fare well in the Administration's budget proposal. This amendment specifically recommends an additional \$2 billion in NIH research funding. To support the proposal, a group of our peer institutions, professional societies and disease advocates banded together in an intensive campaign to communicate the urgent need to support the Specter/Harkin amendment. On Friday, March 17th, the Specter/Harkin amendment passed on the floor of the Senate with 73 votes. We owe great thanks to Senators Specter, Harkin, Feinstein and Boxer. I would also like to thank Ryan Adesnik, Director of Federal Government Relations at Stanford, for his tremendous leadership on this issue.

While the Specter/Harkin amendment is a very positive opening salvo, we have many remaining challenges in this year's federal budget process. The House of Representatives, where proposals to add funding face a higher political hurdle, must also pass a budget resolution. That House resolution would then have to be negotiated with

the Senate. Issues like these are very hard to negotiate, especially in an election year, but the high level of Senate support for NIH will be very helpful. In addition, it is important to understand that budget resolutions have had greater impacts in recent years, but they are still viewed as a general guideline for the appropriations process.

Another important issue I wish to bring to your attention is the extreme funding cut approved last year to the Title VII Health Professions Accounts at the Department of Health and Human Services (HHS). Title VII initiatives such as the Health Professions Training for Diversity Centers of Excellence and Health Careers Opportunities programs have supported some extremely successful work led by Fernando Mendoza and others at Stanford to encourage minority students from middle school through college to enter medical schools and to pursue careers in clinical practice and academia. In my opinion this funding cut is a very serious problem, and it represents a very unfortunate direction by the current Administration. Many leaders across the country are working very hard in what is clearly an uphill battle to restore these cuts – and I also want to acknowledge the advocacy role that a number of our medical students are playing in this effort as well. In the House of Representatives Congressman Charlie Norwood (R-GA) and Congresswoman Diana DeGette (D-CO) are circulating a letter in support of these programs. The letter has so far garnered signatures from 171 House members including our local Congresswoman, Anna Eshoo (D-CA). A companion Senate letter is currently in the works.

Separately, the Senate also approved on March 16th the Feinstein-Mikluski-Collins Amendment to provide an additional \$390 Million for cancer research and prevention programs in the FY07 budget. This amendment would impact the NIH, CDC (Center for Disease Control) and HRSA (Health Resources and Service Administration).

We will remain extremely active in the coming months in support of NIH and Title VII programs. If you have any questions or suggestions please do not hesitate to contact me or Ryan Adesnik, our Director of Federal Government Relations, at radesnik@stanford.edu.

Official Report from the LCME

The official report from the Liaison Committee on Medical Education (LCME) was sent to President John Hennessy in early March. It is something we should all be proud of – certainly compared to prior reports. The final 205-page report represents the work of the Site Review Committee that visited Stanford on October 16-19, 2005, coupled with a review by the LCME Council at its February 22-23 meeting. Based on the review we received a full eight-year accreditation, and our next full site review will take place in 2013-2014. In their official communication, the LCME identified some areas of strength (i.e., those that are above and beyond the expectations of the LCME) along with some areas that require continued attention during the years ahead. I share these comments with you in an unedited fashion in order to provide the greatest degree of transparency in this very important matter.

As stated in the letter to President Hennessy, the LCME concurred with the Site Review Committee in their assessment of areas of institutional strength, including:

1. Dean Philip Pizzo has demonstrated his commitment to medical student education in a number of concrete ways, including making significant financial and other resources available and taking an active role in the conceptualization and planning of the new curriculum. Dr. Pizzo is recognized by faculty and students as a catalyst for bringing about curriculum change.
2. There is a climate of collegiality among faculty that transcends departmental boundaries. This is exemplified by significant amounts of cross department and inter-school teaching and research.
3. Average medical student debt is less than one half that of other private schools. This is made possible, in part, by endowment income that is committed to scholarship support. Students also receive comprehensive debt counseling.
4. The medical school has made a major investment in information technology to support the medical education program. This permits the utilization of innovative computer based applications in the teaching and evaluation of medical students.
5. The medical school, through the leadership of the library staff, has created a “library without walls” allowing students and faculty to have access to information from any location. Library staff are widely involved in curriculum planning and in medical student education.
6. The medical school has committed significant resources, such as funding and personnel, in a targeted and coherent way to facilitate educational program change. The system to allocate funding to departments for teaching activity has facilitated the participation of faculty in teaching. A number of administrative positions, which are filled with talented and committed individuals, have been added to support medical education.

In addition, the LCME identified a number of transitional areas that will require close monitoring as well as three issues that require specific attention. The so-called “transitional issues” – which can obviously become strengths or weaknesses – include, in the words of the LCME:

1. The medical school is working to resolve scheduling conflicts between medical school courses and required courses in the scholarly concentrations. In this context, a system to monitor student workload will be necessary.
2. The Committee on Courses and Curriculum has been examining the teaching of clinical skills across the curriculum, based on concerns about student performance in the final clinical skills examination and student concerns about the level of clinical skills teaching during clerkships.

3. The system for student advisement, including academic and career counseling, has changed in recent years. Student satisfaction with and utilization of the new advisory system are mixed.
4. A plan has been approved for a new medical school education building (the Learning and Knowledge Center) with groundbreaking scheduled for 2007.

I agree with these issues and know that each area is currently being worked on by the Medical Education group and student services. In addition to these transitional issues, the LCME stated three areas of concern, as follows:

1. At the time of the survey visit, departments were in the process of implementing a mid-clerkship review of patient encounter data but the process had not been completed in all departments.
2. The implementation of a more systematic process to ensure formative feedback during the surgery and obstetrics-gynecology was underway at the time of the survey visit.
3. Faculty diversity currently is limited and does not approach that of the student body.

Based on this, the LCME wishes to have follow-up addressing the following important areas in 2007: a) Monitoring patient encounters; b) Providing formative feedback; c) Promoting faculty diversity; d) Coordinating student schedules; e) Teaching clinical skills; f) Advising students; g) Constructing the Learning and Knowledge Center.

Overall this is a terrific report and I want to thank again the many dozens of faculty, students and staff who worked so hard to bring this to fruition. While we have important issues to address, we have made major progress and the LCME had praised us for these accomplishments. More importantly, regardless of LCME oversight, each of the areas identified represent issues that we ourselves want to address in our efforts to make Stanford as outstanding as it can be – for our students and for the nation.

Updates from Stanford Hospital & Clinics (SHC)

At the SHC Board of Directors meeting on Tuesday March 7th, two important updates were provided. First, the Board approved a 5- year plan to support the implementation of the Epic clinical information technology. This plan is designed to transform SHC's current systems and provide an important segue to developing an Electronic Medical Record System. The process that was followed to achieve this decision was engaging and timely and, over time, should significantly improve the satisfaction of patients, faculty, community and referring physicians, and employees as well as improving hospital and clinic operations. Many of our faculty were involved in the selection process for Epic. Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology,

provided School leadership and worked closely with Ms. Carolyn Byerly, the SHC Chief Information Officer, and Dr. Kevin Tabb, SHC Chief Quality & Medical Information Officer. This investment by SHC, while enormously costly, is a huge step forward and will ultimately have a major positive impact on the quality and delivery of patient care.

Second, the Board meeting was held at the new North Campus facility in Redwood City.. This site, which was purchased by SHC in December 2005, will be a major ambulatory facility. A number of the School's clinical departments (including Orthopedics, Dermatology, the Pain Clinic, Spine Program and an Imaging Center) will move to the North Campus when renovations are completed in 2008. This will be a wonderful site for patient care and will represent a new paradigm for the School and SHC as we strive to deliver outstanding clinical services at both the Medical Center and this new and exciting North Campus facility.

Judith Cain Appointed Assistant Dean for Academic Affairs.

I am pleased to announce the appointment of Ms. Judith Cain as Assistant Dean for Academic Affairs. Ms. Cain will work with Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, to develop School policy and practices that support and promote our increasingly complex faculty and organizational structure. Of overarching significance in this area are the appointment and promotion process and the support of faculty career development. Judith joins our School's senior management team and, among many other projects, will be working on the implementation of the recommendations of the Appointments and Promotions Task Force, including the development of FastFac, a web-based system designed to improve the speed of long form assembly and review that was recommended by the task force chaired by Dr. Rob Jackler.

Judith comes to the SOM after serving the Deans of the School of Humanities and Sciences since 1990. For the last three years, she was Senior Advisor for Faculty Affairs and from 1995-2003, she served as Assistant Dean for Faculty Affairs. Judith brings a wealth of experience to the Office of Academic Affairs and a reputation for being a trusted advisor and colleague to Deans, Chairs, faculty and staff alike.

Congratulations and welcome Judith!

Awards and Honors

Karl Blume, Professor of Medicine, Emeritus, has received the Lifetime Achievement Award from the American Society of Blood and Marrow Transplantation. This is their highest honor, and we congratulate Dr. Blume!

Sarah Donaldson, the Catharine and Howard Avery Professor of Radiation Oncology, was recently elected to the Board of Directors for the Radiological Society of Northern America (RSNA), the world's largest radiology professional society. In the role as liaison-designate for science, Donaldson will be able to participate in the research component of the annual scientific program, work with the Research & Education Foundation and help formulate the research and development, along with the scientific direction of the Society. Congratulations to Dr. Donaldson!

Robert Negrin, Professor of Medicine (Bone Marrow Transplantation), has been recently instated as the President of the American Society of Blood and Marrow Transplantation Society at their annual meeting in Honolulu, Hawaii. Congratulations to Dr. Negrin!

Medical student **Sepideh Saber** has been awarded a 2006 Carolyn L. Kuckein Student Research Fellowship by the Alpha Omega Alpha Honor Medical Society. The Fellowship will support her research on "Progenitor cell dysfunction and impaired vasculogenesis in diabetic complications." Congratulations, Sepideh!

John D. Scandling, Professor of Medicine (Nephrology), received the National Kidney Foundation of Northern California's highest honor, the Champion of Hope Award, for his contributions to that organization, including Chairmanship of the Medical Advisory Board and to the care of patients with kidney disease. This is the fourth consecutive year the Kidney Transplant Service at Stanford has ranked first in the nation. Congratulations, Dr. Scandling!

Dean's Newsletter

April 3, 2006

Thank You

On April 2, 2001 I published the first of my biweekly Dean's Newsletters. It was my first day at Stanford and I felt it was important to share some of my thoughts regarding the future of the School of Medicine and the Medical Center with my new colleagues. Now 5 years (and 121 Newsletters) later I want to use the occasion of this anniversary to thank the entire Stanford community for the incredible work that all of you do – in education, research, patient care, administration and service to our communities. It has been a privilege to be a member of the Stanford family, whose greatest strength is the excellence and commitment of all who work, study and provide service. I believe we have come a long way together – but we have a tremendous amount yet to accomplish. I look forward to continuing to work with and serve you and this community. Thank you.

It Must Be April: US News and World Report Rankings are Out Again!

Last Friday U.S. News and World Report (USN&WR) posted its rankings of graduate and professional schools. While nearly everyone says that these rankings are not important, few actually refrain from looking at them – and no one who has done well stays silent. This year the School of Medicine was ranked #7 overall (for its MD program – which is up from #8 last year) and the PhD program in Biological Sciences (which includes the basic science programs in the medical school as well as H&S) was ranked #1. We can certainly be proud of these ratings, which are a tribute to our faculty and students.

As you may know from prior communications on these rankings, I have had considerable concern about some components of the methodology used to rank the “research” medical schools. The rank is determined by “quality assessment, research activity, student selectivity and faculty resources.” More specifically, USN&WR weights total NIH grant support most heavily as the measure of research activity. Unfortunately, because of the much smaller size of our faculty compared to peer schools, we are not at the top of the list on this metric. Last year USN&WR included a listing of NIH grant funding per faculty member – where Stanford clearly excels – after several years of my petitioning the editors for this change. And while research/faculty is now included in the score it is weighted far less than overall funding – so at the end of the day size still trumps quality. So, there is still more work to be done with the editors!

Overall, Stanford did extremely well in each of its graduate and professional school programs. It is truly a great university.

Education and the Community

I have previously discussed the evolution of our community health initiatives, which are now under the umbrella of the Office of Community Health (OCH) headed by Dr. Marilyn Winkleby (<http://och.stanford.edu/>). In addition to having outstanding programs in research, education and patient care, it is important that the School and Medical Center have a strong presence in the community, that we provide valued services and that our students and faculty have the opportunity to contribute to and learn about community initiatives. It is also important that the programs associated with the School of Medicine have associated analytic metrics to help validate whether they are truly making a difference.

I am pleased by the recent accomplishments of the OCH in providing support, advice and courses for our students in community health assessment, research methodology and patient advocacy. Additionally, in tandem with the efforts of the Dean’s Office in medical education, just over 20 medical students have enrolled in the Scholarly Concentration in Community Health this year (bringing the total to 40 students), and an additional 11 medical students are pursuing Masters in Public Health degrees at either our joint program with UC Berkeley or at another institution.

In addition to increasing the available course offerings in community education in the medical curriculum, the OCH is promoting student research activities. A number of

meritorious publications have appeared in the medical literature based primarily on work conducted by medical students. OCH is also facilitating advocacy projects for students enrolled in the “Practice of Medicine” course (one of the foundational courses in the medical curriculum) and is also building links to the Stanford Medical Youth Science Program, the Biomedicine training programs and numerous pipeline programs including the Center of Excellence and the Stanford University Medical Alliance. The Cardinal Free Health Clinics constitute another important resource for students to have an opportunity to both learn and contribute to the health maintenance and monitoring of those with limited access to health care.

Looking forward, the OCH plans to develop a population health core curriculum for the Practice of Medicine course. In addition, plans are underway to develop a database of faculty and community research mentors and to jointly sponsor workshops and lectures relevant to community based scholarship and public service. An important goal is to increase the number of students doing original research related to community health challenges and issues and to form partnerships with School of Medicine and University groups involved in community partnerships – including such programs as the Haas Center, the Office of Diversity, the Center for Ethics and Bioethics, the Center of Excellence, and the Cardinal Free Care Clinics.

To support these programs, efforts have begun to raise financial resources from foundations and other sources of private funding. This is particularly important given the likely very serious cutbacks that are proposed by the Administration for Title VII programs. These cutbacks will have a very negative impact on our ability to sustain excellence in these areas.

While our clear focus and mission is that of a research-intensive school of medicine, strong programs in community health and service are also needed, and they further demonstrate the important role that we play as an academic medical center. I am pleased by the progress to date but also recognize the considerable efforts that lie ahead. If you have questions or recommendations please address them to Dr. Winkleby at winkleby@stanford.edu.

Planning the LKC and Launching C-Sim

Work is progressing to further enhance our leadership in medical education. On Monday evening, March 27th, I hosted an appreciation event for members of our community who have contributed to the simulation center that has been pioneered and championed by Dr. Tom Krummel, the Emile Holman Professor and Chair of the Department of Surgery at SUMC and Susan B. Ford Surgeon-in-Chief at LPCH. This center, which will open at the end of 2006, will be an integral component of the Learning and Knowledge Center at Stanford.. Thanks to generous contributions, the center will be known as the Goodman Simulation Center at Stanford. It will house state-of-the-art robotic, haptic and virtual reality devices that simulate surgery and that can be used by students, residents/fellows and faculty to enhance their surgical skills or even prepare for surgical procedures. This will be a unique center not only because of the resources it will provide, but also because

of its location near the operating rooms at Stanford Hospital & Clinics. This is truly a very exciting and important project.

In tandem with the establishment of the Goodman Simulation Center, the NBBJ architects have begun to further refine and develop the design and schematics for the Learning and Knowledge Center, which will include new construction as well as significant renovation. An update of this exciting project appeared in the March 8th issue of Stanford Medicine (see <http://news-service.stanford.edu/news/2006/march8/med-architect-030806.html>).

Sexual Harassment Training

The Respectful Workplace has been an important initiative and goal for the School of Medicine during the past several years. In conjunction with the University, the School monitored the mandatory training of faculty and supervisors in sexual harassment. Some 1,740 individuals in the School of Medicine were required to take this training and I am pleased to say that as of March 30 compliance for the School was 100% -- meaning that every individual who needed to take the training has now done so. I will be especially gratified if this knowledge helps assure that sexual harassment or other infractions of the Respectful Workplace are eliminated from the School of Medicine. That said, if members of our community have concerns, they should bring them to Ms. Martha McKee, Ombudsperson, Ms. Ellen Waxman, Director of Faculty Relations, or Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs. We are committed to doing all we can to sustain as respectful a workplace as possible.

Update on the Pediatric/Obstetric Faculty Practice Organization Planning

During the past several years a major transformation has occurred in Stanford Pediatrics and the Lucile Packard Children's Hospital. Without question the Children's Health Initiative played a critical role in catalyzing and driving this transformation, which has resulted in many new and enhanced programs and in the recruitment of more than 45 faculty. Thanks to the efforts of many individuals, most notably Drs. Harvey Cohen, Alan Krensky, Ann Arvin, David Stevenson, Tom Krummel, and Ken Cox from the School of Medicine, along with Chris Dawes, Sue Flanagan, Cynthia Haines and Bonnie Whalen from LPCH, and the support of the Lucile Packard Foundation for Children's Health and the LPCH Board of Directors, Stanford Pediatrics today is at a whole new level – with much promise ahead.

Despite the progress and accomplishments that have occurred to date, considerable challenges remain. These include the further building of excellence in clinical and academic programs, which itself includes the recruitment of junior faculty and future leaders and the transformation of the training programs to be more consonant with the strategic direction of the School of Medicine. With the continued expansion of the clinical programs at LPCH, plans for developing and implementing a pediatric/obstetric faculty practice organization (FPO) continue to move forward. The goal of the FPO will be to *“advance the missions of the Stanford School of Medicine and Lucile Packard*

Children's Hospital where they intersect in the delivery of professional medical services." The FPO will endeavor to improve the efficiency and effectiveness of the physician practice and to improve the quality of patient care based on two principles: first, that the faculty are responsible and accountable for the operations of the practice, and, second, that incentives are aligned between LPCH and the pediatric/obstetric clinical practice for the purpose of improved performance. The Peds/Ob FPO is jointly governed by the LPCH and the School and will be led by a Management Committee chaired by Dr. Ken Cox. There will be functional committees: Quality (chaired by Dr. Larry Hammer), Operations (chaired by Dr. Christy Sandborg) and Finance (chaired by Dr. Bill Kennedy). A recent retreat by the leadership of the Pediatric/Obstetric FPO delineated a number of operational, financial and quality performance goals and objectives (for patients and the practice) and they will be working to further refine these goals and implement changes during the next year.

More on Diversity and Leadership

This past week Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, submitted a very useful progress report to me and I want to share some of the highlights with you. As you know from a previous Dean's Newsletter, (http://deansnewsletter.stanford.edu/archive/11_28_05.html), the primary purposes of the Office of Diversity and Leadership (ODL) is to promote the recruitment and retention of a diverse faculty, and to develop faculty to their full potential as academic and community leaders. Here are some of the areas in which the Office has been active since its inception:

1. **Strategic Plan:** The first step was to create an Executive Advisory Committee comprised of senior faculty and staff. This group developed a strategic plan focused on the five areas delineated below. This is the first strategic plan the School has had in these areas and is in itself a significant achievement. Copies are available from Barb Miller, bemiller@stanford.edu.
2. **Recruitment:** ODL has worked collaboratively with the Office of Academic Affairs to revise the search process to enhance the attention to diversity at all stages of the search and to allow for real-time monitoring. ODL has also provided search committees with new tools as well as education about the important issue of unconscious bias in selection processes. One of Dr Valantine's near-term goals is to increase the diversity of search committees.
3. **Retention:** Faculty Gains and Losses data for recent years indicate that departure rates of women faculty are a significant limiting factor in the growth in their numbers and percentage of the faculty. Understanding the reasons for departures and exploring the development of more effective retention strategies will be a priority for ODL's work in the next six months.
4. **Leadership:** ODL has inaugurated the Faculty Fellows program, a 9-month leadership development program for a select group of faculty who have been

identified as having significant leadership potential. I was very pleased to be one of the speakers in this program. In addition, the Office has also co-sponsored, with Stanford Hospital and Clinic, a year long Physician Leadership program. Twenty of our women faculty participated in a series of women in leadership workshops sponsored by the Provost's office. ODL is also developing a Leadership Competency Model that will be piloted with the Faculty Fellows.

5. **Rewards and Accountability:** ODL is developing a series of faculty and staff awards that will acknowledge the efforts of those who are seen by others as diversity advocates. Please begin thinking about who is deserving of acknowledgement. In addition, Dr. Valentine will be working with me and with others to develop appropriate accountability measures for diversity and leadership development activities.
6. **Communication:** The Office is developing a web site and is engaged in collaborative efforts with the Office of Communications and Public Affairs to increase the awareness of both achievements and concerns that we need to address.

I want to re-emphasize my commitment to diversity and to the development of strong leadership at all levels of the School. Dr. Valentine and her staff have begun important work in these areas, and I look forward to seeing further progress in the coming months.

Awards and Honors

Please join me in congratulating **George Fisher, Associate Professor Medicine (Oncology)**, as this year's recipient of the American Cancer Society's St. George Medal of Honor Award. This represents the Society's highest honor and is given to an outstanding volunteer who has made a significant contribution to the achievement of the Society's goals over an extended period of time. Dr. Fisher has certainly been an ardent volunteer for the ACS and is most deserving of this special honor.

I am pleased to announce that three awards were granted to Division of General Internal Medicine faculty and affiliated physicians at the California Regional meeting of the Society of General Internal Medicine on Friday, March 17th:

Rex Chiu, MD (SMG): California SGIM Community Service Award for his efforts as Medical Director of the Pacific Free Clinic. This award is intended to recognize SGIM members who have made significant contributions to improve the health of their community.

Yeuen Kim, MD (Willow Clinic): California SGIM Outstanding Innovation Award for her poster entitled "Working Smarter, not Harder: Redesigning Clinic

Visits," representing innovations in clinical practice at Willow Clinic to enhance productivity, patient and provider satisfaction.

Alan Garber, MD, PhD (PCOR): SGIM Clinician-Investigator Award

This award is intended to recognize a member of our region for excellence in research and teaching.

Well done, and congratulations, to all three awardees!

I am delighted to announce that **Sepideh Gholami**, President, Stanford Medical Student Association (SMSA), has been awarded a 2006 Alpha Omega Alpha Carolyn L. Kuckein Student Research Fellowship, to support her in part while doing her research on "Progenitor cell dysfunction and impaired vasculogenesis in diabetic complications." Congratulations, Sepideh!

Graduate Students Honored for Teaching

On Tuesday evening, March 7th, 12 Stanford Graduate students were honored for the outstanding contributions to teaching. The students who were recommended by department chairs and advisor, each received a letter of recognition and a check for \$1,000 in recognition of their contributions. I am very pleased to celebrate the contributions of our Graduate students and also want to thank Dr. Ellen Porzig for inspiring this award. The students who were honored include:

Matthew Evan Carter
Saul Abraham Villeda
Trent Alan Watkins
Daniel Ramot
Nancy Elizabeth Adleman
Zachary Scott Pincus
Simone Sigrid Marticke
Kirstin Suzanne Knox
Thomas Michael Johnson
Richard Daneman
Kristin Ann Maczko
Andres Bayani Tellez

HHMI Fellowship Awardees

I'm delighted to announce that 13 of our students will receive a Howard Hughes Medical Institute (HHMI) fellowship award. Congratulations are also due to all advising deans, particularly to Pat Cross who assisted students with these applications. Kudos to all!

Shimon Bababeygy
Pavan Bachiredy
Aadel Chaudhuri

Sudeb Dalai
Mani Foroohar
Geoffrey Krampitz
Mitchell Lunn
Nathan Morrell
Martha Noel
Laura Prolo
Louis Saddic
John Van Arnam
Jack Wang

Dean's Newsletter

April 17, 2006

National Advisory Committee Reviews School

The Stanford School of Medicine National Advisory Council (NAC) conducted their annual visit on Monday, April 10th. At my recommendation, the NAC was appointed four years ago to provide high-level guidance to the Provost and President about the progress of the School in fulfilling its strategic goals and initiatives. The NAC includes leaders in basic and clinical science as well as members of the University Board of Trustees. The chair of the NAC is Dr. Ed Benz, President of the Dana Farber Cancer Institute and Professor of Medicine at Harvard Medical School. The other NAC members are: Elizabeth Blackburn, Professor of Biochemistry and Biophysics at UCSF; Tom Boat, Professor and Chair of Pediatrics, U. Cincinnati and Physician-in-Chief, Cincinnati Children's Hospital; Mariann Byerwalter, Stanford University Board of Trustees and Chair, Board of Directors, Stanford Hospital & Clinics; Ying-Ying Goh, Stanford University Board of Trustees; Daniel Lowenstein, Professor Neurology, UCSF; James Madera, Dean, Pritzker School of Medicine, University of Chicago; William Peck, Dean Emeritus at Washington University; David Satcher, President of Morehouse College School of Medicine; Carla Shatz, Professor and Chair of Neurobiology at Harvard Medical School; William Stead, Director of Informatics Center and Associate Vice Chancellor for Health Affairs, Vanderbilt University, and Sam Wells, Professor Emeritus of Surgery, Duke University.

The scope of this year's visit was broad and began with my annual update on the "state-of-the-school" followed by an in-depth discussion of our progress in medical and graduate student education as well our efforts in postdoctoral training. These presentations highlighted our efforts to train and develop future leaders in medicine and bioscience and to provide enhanced opportunities for training and engagement in translational research and leadership. These include the Scholarly Concentrations in our MD curriculum, MD/PhD and other advanced dual degree programs, the Masters in Medicine program, and our plans for an advanced residency training program. The NAC was interested and seemed pleased with our efforts in these areas. They recognized the importance of Stanford's distinct niche relative to other schools of medicine and,

especially, the importance of our commitment to training future physician-scientists/scholars/leaders as well as leaders in the biosciences. The NAC also had the opportunity to meet with a diverse group of students and postgraduate trainees and to learn directly about their experiences at Stanford – which was informative and exciting.

In order to provide an example of our efforts in translational research, Dr. William Mobley, Director of the Neuroscience Institute at Stanford (NIS), and his colleagues, presented a status report to the NAC. As with all the Stanford Institutes of Medicine a primary goal of the NIS is to foster interdisciplinary research and education that transcends the boundaries of individual departments, draws connections among schools throughout the University, and forges connections to the clinical centers at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. A primary focus of the NIS is to use the scientific strengths across the University to better understand neural networks: how they are organized and carry out their functions, how they can be disrupted in various disease settings, and how these processes can be visualized and monitored with powerful imaging and molecular profiling technologies. A couple of examples of broad interdisciplinary research were offered, including novel collaborations led by Dr. Brian Wandell, Professor of Psychology, in computational neuroimaging and the exciting collaboration emerging through the efforts of Dr. Dick Tsien, George D. Smith Professor of Molecular and Cellular Physiology, and his colleagues on the molecular foundations of autism. Indeed such interdisciplinary collaborations – some arising at the initiation of individual faculty and others facilitated through various “working groups” – offer opportunities to bring the amazingly diverse and deep scientific expertise at Stanford to bear on both fundamental questions and applied problems in neuroscience. NAC members seemed pleased and impressed by the progress of the NIS and the important role it will serve in the future of the School and University.

The NAC also heard an update on the progress being made in the still new Bioengineering Department (joint between the Schools of Engineering and Medicine), particularly in the areas of new faculty recruitments and the graduate education programs. Since the accomplishments that have been made in the past 2-3 years in Stanford's bioengineering efforts have been startling in their rapidity and excellence, it was easy for the NAC to be impressed. That said, there is still much work to do over the next 5-10 years in bringing the Bioengineering Department to maturity – but it is clear we are well on the way. In addition, an update on the Biodesign Program, which is housed in Bioengineering and BioX, was also presented to the NAC. This program, the brainchild of Dr. Paul Yock, Martha Meier Weiland Professor of Bioengineering and Medicine and Co-Chair of the Department of Bioengineering, is a prototype for bringing team-based discovery and innovation to a wide array of clinical and other problems. It has exciting potential applications both to our efforts here at Stanford as well as to those that might involve international collaborations.

Finally, the NAC heard an update from Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, on the extensive changes that have occurred in the past several years in clinical informatics in the School of Medicine. While a very broad array of innovations has been introduced during this period, Dr. Lowe focused on

those aimed at enhancing and facilitating our efforts in translational medicine. Among the most important of these is the STRIDE (Stanford Translational Research Integrated Database Environment) program, which is now becoming increasingly operational and interactive between the School and both SHC and LPCH. The NAC seemed very pleased by these programs and were highly encouraging about future work and development in this area.

The NAC visit concluded with an oral report to President Hennessy about the School's progress to date. This will be followed by a written report in the next several weeks. While the comments we heard at the meeting itself must be viewed as preliminary, I can report that they were highly laudatory of our progress to date, while also pointing out areas where we can address future progress. It is important to share our program developments with critical outside reviewers and to benefit from their recommendations and insights. I will look forward to receiving the official NAC report but I am pleased by the preliminary comments and recommendations.

I want to thank all the faculty and students who participated in this year's NAC review and also express my appreciation to the NAC members, who devoted their valuable time and energy to helping us become ever more successful as a School of Medicine and Medical Center.

Senior Associate Dean for Finance and Administration Appointed

I am extremely pleased to announce that Marcia Cohen has been appointed Senior Associate Dean for Finance and Administration in the School of Medicine. She succeeds Mike Hindery, who left this role in January 2006, after 10 years of service. Ms. Cohen has been the Assistant Dean for Fiscal Affairs and Chief Financial Officer for the School since she joined Stanford in 2003. She has also served as Interim Senior Associate Dean since November 2005. Her selection is the result of a national search that identified a number of highly qualified candidates, including three other finalists who visited Stanford for in-depth interviews a couple of weeks ago. My decision to appoint Ms. Cohen was based on her exemplary performance as CFO and more recently as Interim Senior Associate Dean and was reinforced by the comparative evaluative comments we received from a broad interview and advisory group that included leaders from the University administration, the School of Medicine and both hospitals – which placed Ms. Cohen as the clear choice.

Ms Cohen has had extensive experience in academic medicine as well as management consulting. Prior to joining Stanford she served for 7 years as the Director of Finance for the Department of Medicine at UCSF and prior to that as a Management Services Officer for UCSF's Department of Physiology. She had previous roles in national and international management consulting that covered a very broad array of areas and responsibilities. Ms Cohen received her BA in Economics (*magna cum laude*) from Carleton College, and she holds a Masters degree in Public and Private Management from Yale.

There is little doubt that the role that Ms Cohen will fill is one of the most important at Stanford. It is broad, demanding and has a major impact on the School, Medical Center and University. I am confident that Ms. Cohen has the professional and personal skills to carry out her new role with excellence, and I am pleased that we were able to identify someone who already knows so much about our programs and needs to take on these significant responsibilities. I look forward to a continued and productive working relationship with Ms. Cohen and ask that you please join me in congratulating her and welcoming her to this important position.

Dealing with Traffic Congestion

You have likely heard by now that the University is facing penalties under the General Use Permit (GUP) agreement if “GUP trips” exceed the limit placed on peak-hour vehicle traffic, including high costs for road improvement and long-term limitations on new square footage we have planned for research and other expansion. “GUP trips” are defined as car trips on campus between the hours of 7:30 and 9 am and 4:30 and 6 pm. You may recall comments this issue in the newsletters of August 9th (http://deansnewsletter.stanford.edu/archive/08_09_05.html#5) and October 3rd (see http://deansnewsletter.stanford.edu/archive/10_03_05.html#9) of last year, when the School implemented a survey to discover current commuting habits and educate faculty and staff about peak-hour traffic.

The Provost recently sent an urgent request to members of the University Cabinet and the University Management Group (UMG) that stated: “We must immediately introduce additional measures to reduce peak-hour trips that will lead to long-term changes in commuting habits. It is critically important for both the university and the surrounding communities that we do everything we can to live within the commute traffic limitations of the GUP.” In addition, the Provost personally contacted me and asked that the School of Medicine, as the largest and fastest-growing segment of the University, embrace this effort.

To respond to the Provost’s request, the School of Medicine has asked departments to immediately introduce (beginning today, April 17th) flexible hours for staff to ensure that no drivers leave campus between 4:30 and 6 pm one day per week. This will be a pilot program lasting several weeks while we create other long-term programs and incentives to achieve significant, permanent reductions in peak-hour traffic. The permanent programs will comprise data collection, implementation of and education on an array of alternative work and commuting options for staff, commitments from staff and departments for long-term changes in commuting habits or work hours/location, incentives, and changes in the culture of the institution to allow the implementation of these efforts. Our goal will be to cut peak-hour trips by at least 15% initially. As an added dividend, this review may also help us define more efficient and functional flexible work plans for our employees.

I realize that requests like this carry a number of challenges and implications, especially when imposed on a short time line. Accordingly, I ask that faculty, supervisors, staff and

students be as flexible and creative as possible, given the need for urgent change. Specifically, if you drive onto campus, please be aware of and avoid driving during peak hours. Department staff should be encouraged to use flex time (come in early and leave early, or vice versa) or, in the case of exempt staff, telecommute and be accepting of non-traditional work schedules.

To find creative solutions to the workflow and transportation problems, the Provost's office is also pursuing other novel programs. For example, the Health Improvement Program is sponsoring a class to teach about alternative travel options – including mass transit, biking, or carpooling. The payoffs are multiple – less stress, more exercise, less pollution, save money (in fact, Stanford will pay you up to \$204/year if you do not purchasing a parking permit), less greenhouse gas and more satisfaction from making a difference. If you are interested, the first class will be on April 21st between 12-1 pm at 655 Serra Street in the Magnolia Room. To register call 723 9649 or visit <http://hip.stanford.edu>.

Your help, flexibility and assistance are most appreciated.

Advocating for the NIH

The academic community is very concerned about the impact of reduced NIH spending on research and the consequences for medical schools and academic medical centers across the nation. I have described some our concerns and efforts underway to try to reduce some of the potential damage through Congressional remedies in recent Dean's Newsletters (see http://deansnewsletter.stanford.edu/archive/01_23_06.html). This is both a political as well as a financial challenge and it is imperative that we each do all we can to alter the course now being taken by the Administration. On Tuesday, April 11th, I published the following Op-Ed piece in the San Jose Mercury News – which I include below in case you missed it. While the Congress went into recess without dealing effectively with this issue, work is underway to try to address this when the next congressional session begins. Your advocacy, especially through your professional and scientific societies, is most important.

Budget pressures jeopardize the future of medical research

Philip A. Pizzo, MD

At the turn of the 21st century, the federal government doubled the budget for the National Institutes of Health with the goal of securing its status as the most powerful medical research enterprise the world has ever seen.

But later this week the House of Representatives could shed light on the government's vision for the future of this agency -- the driving force in the nation's effort to find cures for cancer, heart disease and scores of other maladies. When the chamber votes on a budget resolution that addresses the agency's funding, it will be a sign of whether a troubling budget trend has emerged: the ``undoubling" of the NIH.

The NIH has been at the forefront of developing the panoply of vaccines that has prevented serious illnesses. It has helped to realize new treatments that have reduced mortality rates from heart disease and strokes by 40 percent and 51 percent, respectively, since the late 1970s. In the last year, at Stanford University School of Medicine alone, NIH money has helped to make possible a vastly improved way to do stem cell transplants for curing leukemia, the development of a new class of drugs for treating the symptoms of rheumatoid arthritis, and the identification of a gene that could help doctors pinpoint and begin treating children at risk of schizophrenia before symptoms appear.

And that barely scratches the surface of the NIH-funded work that is taking place at Stanford and across the nation.

Unfortunately, after several decades of increasing NIH budgets -- under both Democratic and Republican presidents -- the current leadership in Washington has reversed this course. In this year's budget, funding for the NIH was cut for the first time in more than 30 years, and the administration's budget proposal for next year would freeze the NIH budget at that level. The amount provided next year to two of the NIH's biggest institutes, the National Cancer Institute and the National Heart, Lung and Blood Institute, would be cut by \$40 million and \$21 million.

The bottom line: The budget proposal would give the NIH 13 percent less, when adjusted for inflation, than it had in 2003, the end of the five-year period in which the budget had been doubled.

While the NIH's funding remains substantial, our research systems are fragile. A loss of support can quickly begin to unravel our progress, particularly as other nations launch unprecedented research initiatives. Vast new research programs have been built in China, Singapore and India, as well as in Europe.

Talented bioscientists and trainees who once considered the United States the only place to conduct their work now have other options. Over the last few years the tiny nation of Singapore, for instance, has successfully recruited three of the National Cancer Institute's most senior scientists with its commitment to long-term funding and its spacious, state-of-the-art laboratories.

Even more disturbing is that the pipeline of new talent to succeed these and other established scientists will be jeopardized as research funding becomes less available. It's already apparent that the growing challenge of obtaining NIH funding is sapping the morale of many in the field. The competition for grants has become brutal, with fewer than one in 20 applications winning approval. This year the number of new grants funded by the NIH is projected to be down by almost 15 percent from the number funded three years ago.

This increased competition for scarce resources isn't going to lead to better science. If the NIH dollars become tighter, it will become less likely that innovative ideas will flower. The best and brightest of our researchers will be less willing to take risks for fear of not being funded. Consequently, they may turn to more predictable, ``safer" funding proposals, potentially missing the opportunity for major breakthroughs.

The effect of under-funding on research is well illustrated by the challenges the nation now faces in the physical and engineering sciences. There is widespread concern that we are losing our competitive edge in fields in which we have long been leaders. To the president's credit, he has championed the American Competitiveness Initiative to ratchet up federal support in these areas.

But it would not be in the national interest to create the same problem in the biosciences that we are now seeking to address in the physical sciences -- especially at a time when the great advances of the future are likely to be found at the intersection of physics, engineering, computers and biology.

I certainly understand that federal dollars are a limited and precious resource, but the NIH's efforts cannot be measured strictly in annual budget cycles. Growth in funding must be sustained if we are to avoid undoing the foundation that has been so carefully laid. Fortunately, a number of leaders in Congress share that perspective. Under the leadership of Sens. Arlen Specter, R-Penn.; Tom Harkin, D-Iowa; Diane Feinstein, D-Calif.; and Barbara Boxer, D-Calif., the Senate approved a resolution recommending adding \$2 billion to NIH, bringing its budget to about \$30 billion. The House is slated to consider its budget resolution in the next few days.

This vote is but one step in the budget deliberations, though for medical scientists it will send an important signal. Will Congress remain steadfast in its commitment to research endeavors that can span decades but which offer the prospect of cures for future generations? Or will the NIH fall prey to a funding cycle that demands immediate gratification and instant results, thus losing sight of the future health of our nation?

Mentoring Guidelines for Postdoctoral Fellows

At the April 7th Executive Committee meeting, Ms. Chequeta Allen, Assistant Dean for Postdoctoral Affairs, along with Drs. John Boothroyd and Jody Puglisi, members of the Provost's Advisory Committee on Postdoctoral Scholars, presented a recommendation from the Committee to formalize postdoctoral scholar mentoring guidelines. A number of important concerns have been identified that require attention, including:

- Some postdocs – and Principal Investigators – find it difficult to initiate a mentoring meeting and discussion

- Some postdocs report a lack of mentoring by their PIs
- Others postdocs report that they experience a lack of feedback about their progress and goals
- Some PIs have asked for additional resources in this area

In response to these issues, the Provost's Advisory Committee has recommended the implementation of an annual career progress conversation, and they have devised guidelines to help facilitate this process. The guidelines have been incorporated into a mentorship discussion template document, which postdocs will complete and bring to the meeting. It includes sections about research progress, research growth and development (including plans for the upcoming year), and career development. It will be used as a framework for oral discussion and not as a written record. Postdoctoral scholars have had input into the development of these guidelines and have participated in piloting them.

The members of the Executive Committee endorsed this proposal and will work with their faculty to implement it. The expectation is that PIs will have this mentoring discussion annually with each of their postdoctoral research fellows, beginning in July, 2006, at the one-year anniversary of the postdoc's appointment. An educational session for postdocs on the mentoring guidelines is also planned for July. The Annual Postdoctoral Research and Career Progress/Mentorship Discussion Template may be obtained from Assistant Dean Allen (challen3@stanford.edu).

I am very pleased that this recommendation has come forward. Postdoctoral research scholars are a critically important part of our community, and we want to do everything we can to foster their careers while they are at Stanford and to prepare them for their future scientific careers.

Heading Toward Development

On Monday April 10th, I gave an update on the School's development plans to the University Board of Trustees, as part of a panel discussion that included Deborah Stipek, Dean of the School of Education, and Sharon Long, Dean of Humanities and Sciences. This was part of a series of updates to the Board on how the various Schools are preparing for a University-wide campaign.

As I have also detailed in other communications, I described to the Board the transformative changes we have been implementing during the past several years under the banner of our Strategic Plan *Translating Discoveries*. I pointed out why it was important to organize and coordinate our missions in education, research and education at this important juncture in history, given the tremendous progress in biomedical research during the past several years that is now juxtaposed against the deficiencies in our health care system. While it is true that most Americans indicate their respect for biomedical research, it is notable that an ever-increasing number are expressing their frustrations

about our healthcare system – or the lack thereof. This is important since, if the public does not understand or appreciate the important contributions made by academic medical centers and teaching hospitals to their current and future health and welfare, it is unlikely that they will be enthusiastic in their philanthropic or community support for our various endeavors. Accordingly, it is important that we address and communicate big and important issues in a bold and compelling manner.

Given our relatively small size, it is important for Stanford School of Medicine to be more focused and to capitalize on its unique attributes and opportunities. These include the extraordinary opportunities for interdisciplinary education and research that exists in partnership with the greater University and that extend to our teaching hospitals and the community in Silicon Valley. As much as possible our goals should be aligned and coordinated in the context of our primary commitments to training leaders, fostering innovation and discovery, and, where possible, applying new knowledge to improve human health. In my presentation I detailed how we are seeking to accomplish these goals through our education programs focused on developing and training future leaders, innovators and scholars.

I also discussed how important it is for us to continue to support our basic research efforts – ideally in an interdisciplinary manner, as exemplified by BioX and bioengineering. This support, which is really an investment in the future, also involves fostering an environment that brings together diverse communities from throughout the University to address important problems in human health. These efforts are currently codified in our Stanford Institutes of Medicine. While our five Institutes are moving forward on different timelines and with varying objectives, they are each creating broad based communities within Stanford and are drawing the connections between research and patient care. But to make them truly effective, considerable resources will need to be garnered, especially from the private sectors, to help support program development as well as essential capital projects.

To capitalize more optimally on our current strengths and on our vision for the future, the School has worked cooperatively with SHC and LPCH (separately and together) to develop an integrated fundraising plan that addresses the important linkages in program and capital project development. The scope of the integrated development plan for the School, SHC and LPCH is being delineated and will establish an ambitious fundraising target for the next 5-7 years – but it is what will be necessary to assure the School and Medical Center's success for the first part of the 21st Century.

In addition to a compelling fundraising case (which I believe we do have), it will also take a highly professional medical development team and highly committed and dedicated community volunteers to bring our plans to fruition. However, until Doug Stewart began as the Associate Vice President for Medical Development in October 2004, our development office was understaffed and without appropriate direction. This situation is changing, as a result of considerable financial investment and the identification of successful fundraising leaders, but rebuilding such a program takes time and considerable effort. While progress has certainly occurred, I would venture to say

that we are still at only about 50% of the strength level in personnel that we will need. I am committed to do all I can to support the efforts of the Office of Medical Development - I recognize that our future truly depends on its success. But philanthropic contributions of the size we will need are the result of years of successful prospect identification and stewardship. I am aware that during the early phases, when the groundwork is being laid, it is easy to be critical or impatient of the results attained. But this is a long-term investment of resources and effort, and we must get it right during these early phases in order to achieve the results we seek over the longer run.

Evidence that we are moving down the right path is beginning to come from the number of exceptional community leaders who are starting to align with the Medical Center efforts and be drawn to serve on one of our leadership councils. Further evidence is provided by some of the very major donations that have been received during the past couple of years precisely because we have come forward with big and bold ideas – like our research efforts in stem cell, cancer, neuroscience, cardiovascular and immunity/transplantation/infection and their translation to patient care.

There is much to be done during the next several years to achieve and sustain our dreams and aspirations – but we are getting traction on our development vision and planning and now need to continue and amplify our efforts.

Getting Ready for May 23, 2006

On May 23rd we will have our site visit by the National Cancer Institute (NCI) to review the program Stanford has put together in its application to become an NCI-Designated Comprehensive Cancer Center, which was submitted on February 1, 2006. The effort to become a Comprehensive Cancer Center dates back to shortly after my arrival in 2001 when I appointed a committee to review the question of whether we should submit an application at all and then determined that we should, in fact, proceed with the planning for such a submission. Just over three years ago, Dr. Karl Blume, Professor of Medicine Emeritus, initiated the early foundational planning for the grant, and we began working within Stanford and in conjunction with others (including the NCI) to move this process forward. Two years ago I appointed Dr. Irv Weissman to serve as the Principal Investigator for the Cancer Center, and we then recruited Dr. Steve Leibel to serve as the Medical Director. Last summer Dr. Bev Mitchell joined Stanford as the Deputy Director and, in tandem, Ms Joanne Murphy assumed the role of administrative leader. Since we began the process, over 200 faculty have come forward to become affiliated with the Stanford Comprehensive Cancer Center, and in the grant application, 10 major programs and 11 cores were identified as critical components of the Center. We now await the official feedback that will tell us whether our many thousands of hours of effort have been met with approval. And of course, we face this challenge at the very time that the NIH is facing its own significant financial stresses. Nonetheless, I am optimistic.

On Friday, April 14th, under the guidance of Drs. Weissman, Mitchell, Blume and Leibel and Ms. Murphy, a “mock” site visit was presented to a stellar group of critical external reviewers that included several Cancer Center Directors, a Nobel Laureate and

outstanding leaders in the field. In a marathon presentation effort, the External Advisory Board (EAB), heard presentations from each program and project leader. While noting that the science they heard was spectacular, the EAB – as was hoped – also offered critical and discerning comments, suggestions and recommendations on how to make the final presentation even clearer, stronger and more compelling. I had the opportunity to listen to all the presentations and was certainly impressed and pleased by what was being offered – and by how much it had improved during the past years of intense preparation. I want to thank Drs. Weissman, Mitchell, Blume, Leibel and Ms. Murphy for their leadership and tenacity. And of course I want to thank our faculty and program leaders for the quality of their proposals and presentations. Certainly we all recognize that when it comes to external site visits, we are at the mercy of the process – but I do very much believe that Stanford has made tremendous progress in anticipation of this moment. I look forward with anticipation (although not without some trepidation) to the May 23rd official NCI visit – and of course to success when the review process is completed.

Stem Cell Regenerative Medicine Training Grants Funded – a Beginning

As presented in the **Stanford Report** (see <http://mednews.stanford.edu/releases/2006/april/cirm-funds.html>)) and discussed in a recent interview with Dr. Michael Longaker, the Deane P. and Louise Mitchell Professor of Surgery and principal investigator on the grant (see <http://med.stanford.edu/spotlight/>), the School of Medicine has received \$1.2 million from the California Institute for Regenerative Medicine to train the next generation of stem cell researchers. The April 10 payment is the first of a three-year, \$3.7 million grant that was awarded in September. The grant will support 16 scholars—six graduate students, five postdoctoral fellows and five MD research fellows from departments across campus. This is an important step forward, and I want to thank Drs. Longaker, Minx Fuller and Irv Weissman for putting forth a very well constructed proposal.

But it is important to note that these training grants are not the beginning of the \$3 Billion of bond funds approved by a majority of Californians in the November 2004 election. Rather, this funding is the result of Bond Anticipation Notes (BANs) that represent contributions from philanthropists who have invested in the California Institute of Regenerative Medicine with the expectation that the approved bonds will become a reality. And while it is wonderful that the BAN funds now exist, it is a sad statement on the democratic process that the full funding of Proposition 71 has not yet commenced – and that it is still likely sometime in the distance before that happens. Indeed, at this time we are waiting the decision of Judge Subraw, who heard the case on February 27th – March 1st. While it is expected (I suppose “hoped” is the more correct term) that the plaintiff’s charges will be dismissed, it is also likely that the ruling will be appealed – which could add another year to the process, assuming that the case does not go to the California Supreme Court. So the funding for the training grants, as gratifying as it is, is just a beginning – and one that doesn’t have a clearly defined next step – other than delays – associated with it.

I certainly support the rights of citizens to express their opinion, whether by voting or by legal action. But in this case a clear minority of citizens is doing all it can to block the will of the majority. Unfortunately, this simply slows down the research process, defers the opportunity for discoveries that might have clinical application and further erodes our global position in the field of stem cell research. This is truly unfortunate and only further dashes the hopes of countless individuals who have pinned their hopes on the prospect that stem cell research will ultimately yield results that will favorably impact human disease. Since I believe this will ultimately be the case, even though it is hard to predict the timing, such delays are most disconcerting. And sadly, with these delays, I can predict that whatever discoveries do take place will only occur further into the future. Despite that, I remain hopeful that wisdom will prevail in a more expedited judicial process!

Natural Selection Goes Awry

I have previously written about the evolving anti-science mood in Washington (http://deansnewsletter.stanford.edu/archive/11_14_05.html) and the politics surrounding the appointment to advisory committees – or even the abandoning of scientific oversight committees, as was recently done by the President’s Energy Secretary (see **Nature** 2006; 440: 725). The impact of such decisions is to limit the opportunity for critical scientific input and, conversely, to reinforce an unchecked moral, religious or economic position.

While I have viewed these committee assignments and related activities with considerable concern, the process only became personal within the last couple of months. It began with a call from the Personnel Office at the White House indicating that I had been nominated for an important scientific advisory committee. While I not want to sound immodest, it was an appointment that I believe I would be well qualified to assume. However, since it was also a Presidential appointment, I needed to go through an interview and vetting process. Of course that is reasonable but when the questions turned to my position on stem cells or my “party” affiliation, it was clear to me that the selection process would likely be influenced by factors other than scientific expertise. Likely not surprisingly, I was not appointed to this committee. While I surely recognize that there may have been other justifications for this decision, I also believe that the various litmus test questions I was asked likely accounted for much of the final decision. I fully recognize that a political appointment process has been part of the “American Way” since the signing of the Constitution if not before. However, I believe it is unwise and even dangerous when such political factors are used to screen the selection of individuals for scientific advisory committees or scientific leadership positions. We run the serious risk of losing our excellence and prominence in science with such practices – which appear to be on the rise in Washington these days.

Medicine and the Muse

The Annual *Medicine and the Muse: An Arts, Humanities and Medicine Symposium*, will be held on Thursday, April 20th beginning at 5 pm in the Cantor Arts Center. The Symposium will feature art, presentations, posters and music by Stanford medical students.

This year's Keynote speaker will be Denise Grady, Science and Health Reporter for the New York Times, who will speak on "*Bridging the Gap: Communicating Health Knowledge*". Ms Grady has written more than 500 articles about medicine and biology for The Times and has edited two books, one on women's health and a second on alternative medicine. She has also authored a book about emerging viruses (*Deadly Invaders*) that will be published in the fall of 2006.

I want to thank Dr. Audrey Shafer for her leadership in this valued event and for the directorship provided by James Andrews (SMS II) and Seth Sherman (SMS I). I would encourage you to attend if at all possible. For further information, contact Paula Bailey pbailey@stanford.edu or visit <http://scbe.stanford.edu>.

Relay for Cancer Survivors

As the cures rate for pediatric malignancies has now exceeded 70%, an increasing number of young adults are survivors of childhood cancer, and there are many millions of adults who have survived cancer as well. On May 26-27th the "Relay for Life", a 24-hour flight against cancer, will be held at Roble Field at Stanford University. Sponsored by the American Cancer Society, the Relay for Life will offer an opportunity for teams of students or other interested individuals to provide support for cancer care and research.

To start a team for the Relay for Life contact Ana Pena at agp@stanford.edu or Maren Shipe at meshipe@stanford.edu. Or for additional information visit: http://www.cancer.org/docroot/PAR/Content/Par_1-Relay_for_Life.asp

Events

- **Cardinal Free Care Appreciation:** On Thursday April 13th an Appreciation Dinner was held in the Schwab Residential Center to celebrate and announce the formation of the Cardinal Free Clinic that merges the Pacific and Arbor Free Clinics. I want to thank the important leadership that has been provided by Lars Osterberg and Rex Chu and the important contributions from our Stanford medical students who serve in the clinics and the many physician volunteers who provide supervision and guidance. And of course I want to thank the members of our community who have provided financial support for the Arbor and Pacific Free Clinics. Now under a unified banner of the Cardinal Free Clinics, these programs will continue to provide support and care for citizens without resources. Indeed a sad testament to reality is that free clinics may be the only source of medical care for members of our community. Accordingly, I am proud of our students, faculty, physician volunteers and donors who help to support this important program.
- **Bing Lunch Series:** Dr. Frank Longo, Professor and Chair of the Department of Neurology gave the final presentation in the 2005-2006 lecture series. Dr. Longo addressed factors that contribute to dementia and cognitive loss and the value of exercise and lifestyle in attenuating or preventing their onset. It was an extremely

well received presentation and I want to thank Dr. Longo for his important contribution.

- **2006 LMSA Conference.** On Saturday, April 8th the Latino Medical Student Association hosted its annual meeting at Stanford with over 500 undergraduate and medical students attending. The topics presented were far ranging and included guidance on career development opportunities and specific challenges for the Latino community. This extremely well done forum required an enormous amount of preparation and a number of Stanford Medical students contributed significantly. I would like to thank each of them and especially Joey Bazan and Geoffrey Krampitz for the very special organizing efforts.

Awards and Honors

- **Dennis Farrey Family Professorship** was officially established on April and its first incumbent, Dr. Mark Kay, officially named as the chair holder. Dr. Kay is a pioneer in gene therapy and has made important and notable scientific contributions to the study of hemophilia and hepatic deficiencies, including viral hepatitis. Please join me in congratulating Dr. Kay.
- I am delighted to announce that Sepideh Saber, a first year medical student, has been awarded a 2006 Alpha Omega Alpha Carolyn L. Kuckein Student Research Fellowship, to support her in part while doing her research on "Progenitor cell dysfunction and impaired vasculogenesis in diabetic complications." We apologize that Ms. Saber was misidentified in the previous Dean's Newsletter. Congratulations, Sepideh.
- The American Medical Association (AMA) Foundation Seed Grant Research Program provides funds to round out new research project budgets. This year's 2006 medical students recipients include Mana Golzari, M. Yashir Kalani and Helen Liu. Congratulations to all.
- The HHMI-NIH Research Scholars Program is a one-year program at the NIH to conduct basic, translational or applied biomedical research under the mentorship of an NIH senior investigator. Congratulations to Reza Ehsanian and Gina Kwon, this year's Stanford recipients.

Appointments and Promotions

Barry Behr has been promoted to Associate Professor of Obstetrics and Gynecology, effective 4/01/06.

Ajay Chawla has been reappointed to Assistant Professor of Medicine (Endocrinology, Gerontology and Metabolism) effective 4/01/06.

Lawrence Crapo has been reappointed to Professor of Medicine (Endocrinology, Gerontology and Metabolism) at the Santa Clara Valley Medical Center, effective 4/01/06.

Jeffrey Feinstein has been promoted to Associate Professor of Pediatrics (Cardiology) at the Lucille Salter Packard Children's Hospital, effective 5/01/06.

Alex Macario has been reappointed to Professor of Anesthesia, effective 5/01/06.

Andrew Patterson has been promoted to Associate Professor of Anesthesia, effective 4/01/06.

Dolly Tyan has been appointed to Professor of Pathology, effective 4/01/06.

Heather Waklee has been appointed to Assistant Professor of Medicine (Oncology), effective 4/01/06.

Dean's Newsletter

May 1, 2006

More About Leadership

During the past several years we have initiated a number of leadership programs in the School and Medical Center. A primary goal has been to develop and train physicians and scientists who will shape the future of medicine and science and guide our mission-related programs at Stanford. While there are certainly "born leaders," many individuals benefit from programs that provide the knowledge and insights to further develop leadership skills. It is my hope that such skills will be acquired by our students and trainees and also by our faculty and staff. I have previously written about some of the programs that are underway under the guidance of Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership (see http://deansnewsletter.stanford.edu/archive/04_03_06.html#7) as well as about the recently launched leadership program for pediatric faculty in conjunction with the Lucile Packard Children's Hospital.

At the April 21st meeting of the Executive Committee, Dr. Joe Hopkins, Clinical Professor of Medicine, provided an update on the Stanford Physician Leadership Program, for which he is the Course Director. The School of Medicine and the Stanford Hospital and Clinics jointly fund this program, which is nearing the completion of its first year. It consists of nine modules spread over the academic year on such topics as assessing leadership skills; work-life balance; managing teams; change and project management; managerial finance; and the critically important issue of health economics vis à vis academic medical centers. Participants also undertake projects related to their

own work and present them to the group. The program is geared towards current physician leaders, including division and section chiefs, course directors, and clinic chiefs, as well as those who are viewed as having significant leadership potential.

This year's group consisted of 27 individuals from 11 departments. Next year's group will be selected from a pool of nominations that has been provided by department chairs, senior associate deans, and the senior leadership of Stanford Hospital and Clinics. The goal of the selection process will be to assemble the most qualified, diverse and inclusive mix of participants as possible. Please be in touch with Dr. Hopkins (joeh@stanford.edu) with any questions about the nomination process.

In addition to the Stanford Physician Leadership Program, the School of Medicine also sponsors the participation of our faculty in the Executive Leadership in Academic Medicine program (ELAM). This is a national program that focuses on the career development of women in medicine. Each year ELAM selects 45 Fellows from academic medical centers in the United States to participate in a yearlong program involving course work, networking and special programs and projects. This year Dr. Hannah Valentine served as a Fellow. I had the opportunity to participate in ELAM by joining Dr. Valentine for ELAM's 2006 Forum on Emerging Issues at the Gregg Conference Center outside Philadelphia on April 26-27th.

This year's Forum focused on "Tapping the Full Power of the Alpha Leader." Using tools such as the Myers-Briggs Type Indicator, researchers have defined a variety of personality types associated with leaders. One of the characteristic leadership profiles is called the alpha leader. Alpha leaders can generally be found in top leadership positions in business, where they can be highly successful. However, they may also have traits that can make them very challenging for colleagues and employees. Some of these negative features were well described in an article in the Harvard Business Review by Kate Ludeman and Eddie Erlandson entitled "Coaching the Alpha Male" (May 2004, pp 58-67). Drs. Ludeman and Erlandson facilitated the two-day ELAM session. Interestingly, when the Fellows and their Deans were evaluated for their alpha characteristics, virtually all fell into this category – regardless of gender, position, institutional affiliation, etc. Indeed, this phenotype may simply be characteristic of individuals who become leaders at academic medical centers, although it is unclear whether the personality characteristics are antecedent to the leadership responsibilities – or a consequence of them.

An important focus of the ELAM discussion was on how to permit alpha personalities to work more cooperatively and successfully and with less negative energy. We did recognize, of course, that there is a variety of so-called alpha types, including Commander, Visionary, Strategist and Executor. And while some individuals show a predominance of one of these alpha types (as was evident at the ELAM Forum), others appear to have a balance among them (this appeared to be true for my own portrait – about which I won't comment further!).

In addition to the problem solving sessions, I found the demonstrable skills, knowledge and evident leadership among the Fellows to be the most impressive part of the Forum.

One of the activities of the Forum attendees was the delineation of the major challenges facing academic medical centers today. Working independently, eight groups of Fellows and Deans presented their top two issues – which were remarkably congruent. First, virtually all focused on the lack of alignment of the missions of academic medical centers with the current state of disintegration of the health care “system” in the United States. Second, the shrinking support for research and the increasing clinical care demands on faculty, driven by the economic forces that have changed the face of medicine, have amplified the difficulty of finding time to educate students and to carry out the research needed to translate knowledge from the “laboratory to the bedside.”

Along with this congruence in identifying the key issues, there was a commitment by these women leaders representing medical centers throughout the nation to become more proactive and more engaged in helping to change this landscape. As a result, I left the ELAM conference more optimistic than when I arrived. If individuals such as the women attending this year’s Forum clearly emerge as leaders in academic medicine, the future can be much brighter than it might otherwise be – and for that I am grateful, pleased and impressed. ELAM clearly seems to be a leadership program that is fulfilling its objectives – and is making a real difference. For your information, ELAM is a core program of the Institute for Women’s Health and Leadership at Drexel University. If you are interested you can review additional information at www.Drexel.Edu/ELAM.

These are examples of leadership that can truly make a difference.

One Giant Step for Stem Cells

On Friday April 21st in a long anticipated decision, State Court Judge Bonnie Lewman Sabraw in Hayward ruled that the California Institute of Regenerative Medicine (CIRM), which was established by Proposition 71 to allocate the funds authorized by the Proposition, could begin raising and allocating research money. A minority of individuals had introduced litigation that challenged the constitutional right of the State to issue the \$3 billion of bonds that nearly 60% of Californians voters approved in November 2004. Sadly this legislation had brought the ability of CIRM to support promising stem cell research to a near halt until last month when Bond Anticipation Notes provided the resources to support training grants that had been approved last summer (see http://deansnewsletter.stanford.edu/archive/11_14_05.html#2). While Judge Sabraw’s decision is a giant step forward for stem cell research, we anticipate that the plaintiffs who brought the initial litigation will appeal the decision, since their major goal seems to be to delay the ability of CIRM to fund stem cell research. Needless to say, these delays are a tragedy for the development of the necessary scientific foundations that could ultimately lead to important clinical applications. And while the prospect of further litigation is disappointing and discouraging, Judge Sabraw’s decision does make its ultimate dismissal more likely – and, with that, the prospect for stem cell research in California more probable. That is certainly encouraging.

Academia-Industry Guidelines Coming Soon

Beginning last summer we have been discussing and developing guidelines to better define our interactions with the pharmaceutical, device and other industries. I have shared some of the issues we are grappling with in prior Dean's Newsletters (see http://deansnewsletter.stanford.edu/archive/02_21_06.html#3). This past week we had a detailed discussion about the latest version of the draft guidelines at our Senior Dean's meeting. We have also been receiving comments from various departments and faculty groups. The plan is to finalize the draft in the next couple of weeks and then to share it for comment with the School's Executive Committee as well as with the leadership at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. With that we hope to have medical-center wide policy on Academia-Industry relations approved by June. Needless to say I will share this policy with you as soon as it is ready for more general circulation.

Legislating Scientific Review Committees

In the last issue of the Dean's Newsletter (see <http://deansnewsletter.stanford.edu/#9>) I commented on how politics may be influencing appointment to scientific committees. I have since learned that Senator Richard Durbin of Illinois has introduced a provision in the Department of Health and Human Services funding billing that attempts to address biased selection of scientific review committees or the dissemination of scientific information that is "deliberately false or misleading." And, importantly, the provision would prevent candidates from being queried about their political affiliation or voting history – as recently happened to me. Even if this legislation is passed (which seems remote), it would likely not have a major impact. However, even if this effort turns out to be only symbolic, it is important that congressional leaders are recognizing and discussing this important matter and suggesting ways to address the anti-science or even theocratic approaches now being employed by the current administration.

Update on the Faculty Appointments and Promotions Task Force

At the April 21st Executive Committee meeting, Dr. Robert Jackler, Chair of the Department of Otolaryngology-Head and Neck Surgery and Chair of the Faculty A&P Task Force, provided an update on the work of this committee. Dr. Jackler last reported to the Executive Committee in July 2005 (see http://deansnewsletter.stanford.edu/archive/07_25_05.html#4). Since that time the group has continued to focus on the overarching goal of aligning the School of Medicine A&P practice with the rest of the University. The major components of this alignment are:

- To have new faculty begin their employment fully appointed and thus to minimize the need for transitional appointments along with the associated problems that arise (e.g., inability to access housing benefits).
- To achieve reappointments and promotions on schedule and thus to minimize the need for one-year appointment extension.

- To expedite file assembly and reduce bureaucratic workload through simplification of process and development of an online file assembly and tracking system.

Dr. Jackler reported that significant progress has been made in four areas that support these components:

- Simplification and rationalization of the A&P process. Dr. Jackler described changes that have been implemented by the Office of Academic Affairs, under the leadership of Vice Dean and Senior Associate Dean for Academic Affairs David Stevenson. These include:
 - The requirement that a fraction of referee letters be in hand at the time of the closure of a faculty search.
 - Clarification of and, in some cases, decrease in the number of referee letters required as well as clarification of the mix of internal and external letters to better match the specific faculty appointment.
 - Flexibility in the formatting of the candidate's CV to save administrative time and effort (i.e., not having to redo the CV to the "Stanford format").
- The inclusion of School of Medicine actions in revised University A&P forms, and the setting of a launch date of May 1 for implementing them in the School. As of this date, for new actions, the School will stop using its 38 forms and begin to use the 5 University forms. Indeed, the very fact that so many different forms were being used only affirms how unnecessarily difficult this process has become – especially since much of this was self-imposed! Questions about this transition should be directed to Judith Cain, Assistant Dean for Academic Affairs, at jpcain@stanford.edu or Craig Spencer, Faculty Affairs Liaison, at cspence@stanford.edu.
- The approval, staffing, and launching of the online web based A&P system, the **Faculty A&P System Tracking File Assembly Completion system (FastFAC)**. The development of FastFAC is a major multi-year initiative led by Philip Constantinou, Associate Chief Information Officer, in partnership with the Office of Academic Affairs, which will be the system's business owner. When fully operational it will improve the speed and accuracy of long form assembly and review by providing an online guide through the long form; automated rules to reduce errors and speed processing; the ability to automatically alert responsible parties of delinquent tasks; and the capacity to provide performance metrics to School leadership.
- The development of benchmark metrics for tracking, by department and school-wide, the number of new appointments requiring interim appointments and the percentage of reappointments and promotions that are on-time versus those

needing extensions. Dr. Jackler provided two years of School-wide data, which showed how much room we have for improvement! Indeed, in 2003-04, only 22% of our new external appointments required no interim appointment, and in 2004-05, the same figure was 24%. Similarly, in 2003-04 only 12% of our reappointments and promotions were on time. In 2004-05, 31% were on time. The Office of Academic Affairs will be sharing each department's data with DFAs, FAAs, and chairs in the near future. The department data will also be provided to the Dean and Senior Associate Dean for Finance and Administration for review at the time of annual performance evaluations. These benchmarks will be tracked and disseminated annually.

Dr. Jackler concluded his presentation by pointing out the critical role of department chairs in the effectiveness of the A&P process. He encouraged the chairs to begin the appointments and promotions processes earlier, complete their own portions of the process in a timely way, emphasize to their faculty the need to actively participate, partner with and support their Faculty Affairs Administrator, and monitor progress of A&P cases on a regular, periodic basis. This is all excellent advice!

The Executive Committee and I are deeply appreciative of Dr. Jackler and the other members of the A&P Task Force for their continuing efforts in this area. In partnership with the Office of Academic Affairs they are transforming the way the School approaches its responsibilities in the faculty appointments and promotions process, and our faculty will be the beneficiaries of their efforts well into the future.

The members of the Task Force are, in addition to Dr. Jackler: Judith Cain, Philip Constantinou, Brian David, Sarah Donaldson, Kathryn Gillam, Jason Irwin, Annelies Ashoff Ransome, Craig Spencer, and Scott Walters. Thanks to all!

Lane Library Celebrates its Centennial

In 1906, two years before the Stanford Medical School was born from the assimilation of Cooper Medical College into the University, the Lane Library was founded in San Francisco. On Friday, April 28th, Lane Library celebrated its centennial – a 100-year history of innovation and excellence. In the years ahead, Lane will, further evolve to become the School's Knowledge Center for the 21st Century (see also <http://lane.stanford.edu/100years/index.html>). The Lane Knowledge Center will be housed in the Learning and Knowledge Center and will include a predominately digital library along with smart interfaces and search tools that will, according to Ms Debra Ketchell, Library Director and Associate Dean of Knowledge Management, “deliver the right information, at the right time, in the right context...anytime and anywhere.” This is certainly a bold vision for the Lane Library for its second century. If you are interested there is more background information on the website at <http://news-service.stanford.edu/news/2006/april26/med-lane-042606.html>.

The Intersection of Stanford Past and Stanford Future

On April 28-29th, students admitted to the 2006 medical school class visited Stanford at the same time that medical school graduates arrived for the 2006 Alumni Weekend. For alumni celebrating the 50th reunion, the School they remember was located in San Francisco. Indeed it was in 1959 when Wallace Sterling and other visionary leaders arranged for the medical school to move to the Stanford campus – thus transforming Stanford Medicine into its current research and academic powerhouse.

Prospective students will be assessing whether the school's renewed commitment to scholarship and the training of leaders in medicine in bioscience and medicine resonates with their own career objectives. The more than 60 students who visited the campus this past weekend had the opportunity to meet with faculty and students and to learn more about the Medical School's new curriculum, as well as its core programs and initiatives. They also had the opportunity to tour the Medical Center and University campuses – and to become as informed as possible about the future directions of Stanford and about whether it is the right institution to shape their careers in medicine.

In tandem with the events for prospective students, the Stanford University Medical Center Alumni Association hosted its annual Alumni Weekend. In addition to tours and opportunities to connect with colleagues and friends, alumni came together on Friday evening at the Arrillaga Alumni Center where the J.E. Wallace Sterling “Muleshoe” Lifetime Alumni Achievement Award was presented to Augustus A. White III, MD’61, PhD, the Ellen and Melvin Gordon Professor of Medical Education and Professor of Orthopedic Surgery at Harvard Medical School, and to Frances K. Conley, MD’66, MS, Professor Emerita of Neurosurgery, Stanford University.

A centerpiece of this year's Alumni Weekend was the Saturday morning Symposium entitled “The Role of Stanford Alumni and Faculty in International Health” that featured a remarkably talented panel of faculty and alumni who have truly had an impact on global health.

This crossroads between Stanford's past and its future provided a window into how Stanford became such a remarkable research-intensive school of medicine as well as an opportunity to preview some of the individuals who will help lead Stanford's future into the 21st Century.

Update on Graduate Admissions 2006

Dr. Ellen Porzig, Associate Dean for Graduate Medical Education, provided an update on the graduate admissions to Stanford in 2006. As of this writing, some 98 students have been selected to enter our 12 PhD programs this fall, from some 250 students who were interviewed at Stanford in March. The entering students will come from 59 different colleges and universities and will represent twelve countries, including Bangladesh, Brazil, Bulgaria, Canada, Germany, India, Malaysia, Mexico, People's Republic of China, Singapore, Sri Lanka and Taiwan, in addition to the United States. Of these 98 students, 63 will enter the School of Medicine graduate programs in Biochemistry, Cancer Biology, Developmental Biology, Neurosciences, Immunology, Molecular

Pharmacology, Microbiology and Immunology and Genetics. In addition, a dozen entering students are underrepresented minorities.

Everyone agrees that the students selected for the incoming class are truly a stellar group. Special thanks go to those who made this exciting outcome possible. Most important are the faculty and students who interviewed and helped select these excellent students – and who serve as the inspiration for why students want to attend Stanford.

Arts and Science of Medicine

In the April 17th issue of the New York Times, Randy Kennedy wrote an article entitled “At Some Medical Schools, Humanities Join the Curriculum.” In fact this has become an important feature of the Mt Sinai School of Medicine. But at Stanford as well, the arts and humanities feature prominently in the lives of our students – underscoring that achieving a holistic life in medicine encompasses both a love of science and an appreciation of the arts. For some of our students this is expressed by their participation in the Scholarly Concentration on Biomedical Ethics and Medical Humanities. For others it is manifested in artwork, music, poetry, literature writing, and a sundry of other impressive activities. These were celebrated at the annual “Medicine and the Muse” event that was held in the Cantor Arts Center on Thursday April 20th. To a standing room only audience, Stanford students demonstrated their remarkable repertoire of talents, which can only be described as amazing. I want to commend and thank all the students who participated and who made this year’s event so successful. I also want to thank Dr. Audrey Shafer for continued leadership for so many of these important initiatives.

Upcoming Events

Community Lecture Series

The next Community Lecture Series will take place on Wednesday, May 3rd at 7:00 pm in the Clark Center Auditorium. Dr. Greg Barsh, Professor of Genetics and Pediatrics, will talk about “Determinism, Chance, and Choice in the Era of Modern Genetics”. This lecture will explore fundamental issues in the discussion of nature vs. nurture in the context of obesity and diabetes, and will explain how advances in experimental and observational genetics provide new opportunities for improving health.

2006 Symposium on Improving Diversity in Graduate Education

On Thursday, May 11th at noon in Munzer Auditorium, the Stanford University School of Medicine and the Biosciences Office of Graduate Education will be sponsoring a symposium on diversity in graduate education. The speaker will be Claude Steele, Ph.D., who is the Lucie Stern Professor in the Social Sciences and Director for the Center for Advanced Study in the Behavioral Sciences at Stanford University. Dr. Steele will speak about “The Psychology of Social Identity: Its Role in Group Performance Differences and the Challenges of an Integrated Society.” Dr. Steele received his Ph. D. from Ohio State University, has honorary doctorates from Yale University and the University of Chicago, and is a member of the National Academy of Sciences. For more information please contact Anika Green, agreen1@stanford.edu .

Brainwave Entrainment to External Rhythmic Stimuli: Interdisciplinary Research and Clinical Perspectives

On Saturday, May 13th, the Stanford Institute for Creativity and the Arts (SICA) presents “Brainwave Entrainment to External Rhythmic Stimuli: Interdisciplinary Research and Clinical Perspectives” at the Center for Computer Research in Music and Acoustics (CCRMA), 660 Lomita Drive, Stanford.

This symposium will engage experts in an interdisciplinary dialogue on the hypothesis that brainwaves entrain to rhythmic auditory stimuli, a phenomenon known as auditory driving. Support for this hypothesis will come from lab research on auditory driving, photic driving, phenomenological fieldwork, and existing clinical applications of this research.

A better understanding of auditory driving may have widespread implications. New insights may extend to the fields of musicology and music cognition regarding the study of human reactions to groove and tempo. The fields of anthropology, religious studies, and ethnomusicology may gain potential insights into the widespread use of rhythmic, repetitive music in religious ritual. Implications for music therapy, psychology, cognitive science, and neuroscience may affect the study of consciousness, and may suggest new, relatively inexpensive methods to treat conditions like ADD, depression, anxiety, insomnia, and chronic pain through the systematic modulation of brainwave states via particular pieces of rhythmic music.

The symposium will combine 30-minute presentations with round table discussions. A public concert (8:30 pm – 10:00 pm) by the Italian tarantella group, Musicántica (<http://www.musicantica.org>) will follow. For more information and registration details, please visit the event website at: <http://sica.stanford.edu/events/brainwaves>.

Awards and Honors

The American Academy of Arts and Sciences last week announced the election of 175 new Fellows and 20 new Foreign Honorary Members. Included in this number are **Minx Fuller, Ph.D.** Chair of Developmental Biology and the Reed Hodgson Professor of Human Biology and Professor of Genetics, and **Sue McConnell, Ph.D.**, Professor in Biological Sciences. Founded in 1780, the American Academy of Arts and Sciences is an international learned society composed of the world's leading scientists, scholars, artists, business people, and public leaders. We congratulate Drs. Fuller and McConnell and are very proud of their accomplishments.

David Stevenson, M.D., Vice Dean, Senior Associate Dean for Academic Affairs and the Harold K. Faber Professor of Pediatrics and Professor, by courtesy, of Obstetrics and Gynecology, has just been selected as the recipient of the Virginia Apgar Award. The Section on Perinatal Pediatrics of the American Academy of Pediatrics gives this award annually to an individual whose career has had a continuing influence on the well being of newborn infants. Congratulations to Dr. Stevenson!

Appointments and Promotions

James Chen has been reappointed to Assistant Professor of Molecular Pharmacology, effective 6/01/06.

Dean's Newsletter May 15, 2006

Perceptions and Misperceptions on the Hill and Beyond

It is always surprising to observe how once treasured institutions or individuals can all – too rapidly fall from grace. For decades the National Institutes of Health (NIH) was widely recognized as the jewel in the crown of federal agencies and had broad bipartisan support from the Congress, Executive branch and beyond. And this support was well justified. Indeed, it is because our nation has invested in the NIH, Centers for Disease Control and Prevention and the National Science Foundation that we are today the world's center of biomedical research. While this investment remains strong, the proposed budgets (which are not adjusted for inflation) for the NIH and the CDC have created significant anxiety and concern throughout the biomedical research community. In recent weeks *Science*, *Nature*, the *New England Journal of Medicine* and other media have featured articles or opinion pieces regarding the impact and perceived consequences of the NIH budget. I have also written about this important issue in Dean's Newsletters over the past few months (see http://deansnewsletter.stanford.edu/archive/01_23_06.html, http://deansnewsletter.stanford.edu/archive/04_17_06.html#4).

A recent flashpoint occurred when Andy Marks, Editor of the *Journal of Clinical Investigation*, published a highly critical editorial on the direction the NIH has been taking through the "Roadmap" initiative that contained more direct personal criticisms as well (see *J. Clin. Invest.* 2006. 116:844). "The current state of the NIH," wrote Marks, "prompts me to say to its director, Dr. Elias Zerhouni: 'Obviously you are not a scientist.'"

While I think many of us agree with many of the concerns expressed by Andy Marks, nearly all of us (including myself) also wish that he had left out the personal attacks since they "became the story" and consequently deflected attention from the real issue – that the NIH needs bipartisan support and, at a minimum, must keep pace with inflation. The failure to do so could squander the incredible gains that have been made in recent decades and, equally, could result in the loss of a generation of trainees and young faculty who have been aiming their careers toward biomedical research.

One of the major debates has been whether the "NIH Roadmap" is consuming the funding that would have otherwise gone into the RO1 pool. There is considerable rhetoric about this issue but the fact is that – at least to date – only a small portion (less than 1%) of the NIH budget has gone into the Roadmap, which fosters interdisciplinary and translational research. While I certainly understand and support the view that our best

investment has historically been in basic undirected research, I also recognize that we currently have unique opportunities in translational medicine. Equally importantly, the Roadmap is a tangible way of conveying to the Congress and the public that the NIH is serious about doing what they most want – improving the diagnosis, treatment and prevention of human disease.

I spent a good portion of the last two weeks in Washington DC meeting with members in Congress, advocacy groups and NIH officials discussing the consequences of the NIH budget. And while I was somewhat distressed to hear from some NIH leaders that the problems are not as serious as they are being made out to be (which is not consistent with the rapidly falling paylines and the increased competition for a shrinking pool of research dollars), I was even more disturbed by the continued perception among important congressional leaders that NIH has had its day with the doubling of the budget and that it is unlikely that either the Administration or Congress would reverse the flat line for FY2007. This outcome would translate into the third consecutive year of below- inflation funding. Clearly we have much work and education to do – and we have to focus on the Congress and public advocacy groups – not on each other. This was well said in an editorial by former NIH Director Harold Varmus with his longtime colleague Mike Bishop that appeared in the April 28th issue of *Science*. Bishop and Varmus write: *“What then is to be done? First stop blaming the NIH – it is a victim, not a culprit, and it urgently needs our collective help. Second, redirect the hue and cry to Congress and the White House. Professional societies and disease-advocacy groups have taken up the cause, but investigators in the trenches have been singularly silent. And third, support the NIH in its efforts to manage resources prudently: Understand the nature of its difficulty and the rationale for restricting the size of awarded grants; encourage favored treatment of applications from scientists for their first awards; and accept opportunities to provide advice by serving on NIH’s advisory and review panels.”*

I agree that a call to action is important – and that our efforts should be directed at making the best case possible for the NIH. Whether one agrees or disagrees with the NIH Director, from all reports he has been quite effective in communicating a strong and effective advocacy message about the impact of the NIH research agenda on human health. A number of these messages are now posted on the NIH website under “Research Results for the Public.” I would strongly encourage each of you to review some of the cited examples and use them in your discussions and advocacy commentaries (see <http://www.nih.gov/about/researchresultsforthepublic/index.htm>). For example, among the impacts Zerhouni cites is that without the last 30 years of NIH investment, heart attacks would still account for 1.2 million deaths annually instead of the approximately 515,000 that now occur. Currently, the NIH is spending about \$95 per citizen on medical research and the cumulative investment over the past 3 decades has been about \$1334 per citizen or \$44 annually per citizen. In turn, life expectancy has increased by more than six years and aging is healthier than ever before.

We all recognize that we are on the cusp of continued and amazing breakthroughs in medical research and that among the best ways to improve health economics is to improve the effective treatment or prevention of disease. Of course this does not belie the

fact that our nation's spending on health care (as compared to research) is out of proportion to the benefits received and that major changes in our health care system are needed. But even if we addressed health care delivery by making it more efficient, cost-effective and quality driven, the benefits of the care being delivered today would not improve without continued research. For example, a major health care provider such as Kaiser may well be able to deliver lower cost care. However, without research done at institutions like Stanford and other academic medical centers, the health care being efficiently delivered today by Kaiser would not likely change in its outcome 10-20 years from now. Investments in biomedical research together with improvements in our health care system are the most effective ways of addressing our nation's health care crisis.

Given the perceptions and misperceptions of our Administration and Congress, it is incumbent on all of us to band together to support biomedical research. I am pleased to note that since my earlier writing on this matter just a couple of months ago, more than 786 organizations (including Stanford) have signed a letter of support urging that the final allocation for the House and Senate Labor, Health and Human Services, Education Appropriation Subcommittees reflect a \$7 billion increase above the President's budget. This increase is specified in the Specter-Harkin Bill, which has already passed the Senate by a vote of 73 to 27. This measure would at least keep the NIH budget at inflation and would, hopefully, help to avoid the undoubling of the NIH budget that will otherwise occur.

We will continue to work diligently on this important issue and I hope that each of you will as well.

Sharing Personal Histories: Students and Donors

We can pass in the hallway, meet in the classroom or on rounds and exchange commentaries about science or medicine. But even when we think we know something about a student or faculty member, it can be illuminating and even startling when people become personal about their own history and relate how their lives were directed toward medicine and science.

On Thursday evening, May 11th, we held the Annual "Financial Aid Dinner," which brings together donors who have provided financial support with the students they are supporting. It is always a remarkable evening. This year some 50 donors were joined by a nearly equal number of medical students along with faculty and staff. As I moved about the room from table to table it was clear that the personal bonding of students and donors had created a wonderful sense of connection, respect and mutual admiration. Generous support from donors has enabled Stanford students to graduate with among the very lowest amounts of debt in the country after four or more years of medical school. Indeed, whereas the national average of indebtedness for private medical schools exceeds \$145,000, Stanford students graduate with about \$62,000 of debt. While this is still quite significant, for most students it is low enough so as to not adversely influence their career path – enabling our students to follow their passions and interests. Clearly this is yet another facet that differentiates Stanford from all of its peers. While we are number one

in this area, it is not one of the measures that impact the ratings for *US News & World Reports* – although it is something we are even more proud of because of the impact it has on our students. And it is something that we are most grateful for since it represents how much our community values and cares about the wellbeing of our students.

I have no doubt that any of the 50 students who attended this year's dinner, or the other almost 400 who did not, have personal stories to tell that would be amazing and meaningful. As part of our tradition, three students were asked to share their personal history in a more public manner and to reflect on how Stanford and financial aid are contributing to their life trajectory. I want to thank Mr. Simon Bababeygy (SMS II), Ms Boy Kea (SMS III) and Mr. Goeff Krampitz (SMS II) for their courage and willingness to speak at this year's dinner about their personal experiences that influenced their choice of medicine and Stanford.. Indeed, each student presented a compelling and often heart-wrenching portrait of courage, resilience, dedication and commitment. Whether their early life was influenced by the ravages of war and terrorism, experience in a concentration camp, or a devastating family tragedy, each of these students demonstrated how otherwise negative forces helped transform their life choices toward medicine and science and how Stanford's financial aid program is permitting them to live their dream. For that we must all be grateful – and clearly our world will be better served as a consequence!

Addressing Barriers to Diversity

Stanford Medical School has one of the very best programs to enhance diversity in the nation. This didn't happen overnight. It is the product of decades of support and commitment by a number of individuals including Drs. Fernando Mendoza, Ron Garcia, Gabe Garcia, and Marilyn Winkleby, among others. Because of their dedication and advocacy, Stanford has benefited from a number of pipeline programs to encourage and enhance minority students to enter medicine. One of these programs is the Center of Excellence, which has been supported by Title VII and Title VIII grants. Unfortunately, the Administration has been seeking to eliminate these programs and in the FY07 budget it is virtually assured that this will happen unless interventions occur. The total amount of funding for Title VII and VIII is approximately \$550 million. While this is not insubstantial, it has had, we believe, major positive benefits – certainly at Stanford. In fact, in recent weeks I have received numerous letters and testimonials from students affirming how much these programs have positively impacted their lives and training.

Last week, Mr. Ryan Adesnik, Director of Federal Relations, and I met with a number of individuals in Washington to continue our advocacy and support for these programs. We were successful in getting the California Healthcare Institute, a public policy research and advocacy organization for California's biomedical industry, to support these programs – since biotechnology leaders in California clearly see the benefits of enhancing the diversity of their workforce. We also found some supportive staff members and Members on the Hill and we are now working with the American Association of Medical Colleges (AAMC) to further foster support for these important programs. Along with other leaders,

I intend to do all that I can to prevent these programs from being destroyed. I believe deeply that the best way to improve the diversity of medicine is to begin with supporting the career development of high school, college and medical students. It is clear that given the tenor of the current Administration this will be an uphill battle – but we will do our best to turn the tide and, hopefully, protect our future.

Board Members and Faculty Exchange Interests and Commitments

Most hospital Board of Directors meetings I attend focus almost entirely on hospital finance, operations, facility, quality and related issues. Certainly these issues are important, especially given the challenging health care environment we live in. And hospital board members, as the fiduciaries of their institutions, are certainly committed to these issues – and often have backgrounds in the corporate world that make them uniquely qualified to do so. But for academic medical centers, it is critically important that hospital Directors understand and appreciate the important and indeed intricate interrelations between, on one hand, the education and research missions of the medical school and university and, on the other hand, the business challenges facing the hospital. Attempts are made to do this on a regular basis at both the Lucile Packard Children's Hospital (LPCH) and the Stanford Hospital and Clinics (SHC). But at the LPCH Board of Directors meeting on Thursday May 11th, a novel and special exchange between board members and faculty was fostered by a unique program spearheaded by Mr. Chris Dawes, President and CEO, and Ms. Jane Binger, Executive Director of LPCH Leadership Development.

Rather than simply having a lecture about a research breakthrough, this Board meeting featured small group discussions between Board members and faculty on 4 topics. Small groups of Directors met with equally small groups of faculty and over a two-hour period had discussions that improved knowledge and understanding bilaterally. The topics included education, translational medicine, research and innovations in surgery. It was clear at the end of this time that everyone had both learned and contributed to each other's knowledge and understanding. This informal exchange, I believe, will help make LPCH Board Directors more aware of how closely related our missions in education, research and patient care truly are – and how much effort we must expend to assure that they are each sustained and enhanced. From my perspective as a participant in one of these discussions (as both a Board member and faculty member) I felt that the time spent was highly valuable and important. Clearly this agenda and format should be done regularly, and I know that this is indeed the intent.

I want to thank Mr. Dawes and Ms Binger for including these discussions in the busy Board agenda and for seeking ways to develop a better understanding of our shared missions – and an enhanced commitment to achieving them.

Valuing Leadership Development

In the last edition of the Dean's Newsletter I gave an update on the joint Leadership Development Program co-sponsored by Stanford Hospital & Clinics (SHC) and the

School of Medicine (see <http://deansnewsletter.stanford.edu/>). On Saturday May 13th, the 27 participants in the inaugural program presented the results of the projects they had worked on as part of the course and then had a “graduation ceremony.” I had the privilege of being present for that event and was extremely gratified to observe the enthusiasm and excitement of all the participants. Everyone remarked on how powerful and helpful the program had been and how much they had benefited personally and professionally from participating. Indeed, the overarching sentiment was a desire for their program to continue so that they could continue to learn from each other.

Among the important benefits of programs like this is the creation of new networks and improved understanding among individuals from varied backgrounds and disciplines. Given the demands on time, especially for clinical faculty, the opportunity to acquire new management and leadership skills and develop new perspectives is enormously important. It seems clear that this opportunity was realized for the first group of participants. At least one task will be how to keep this nascent network alive as well as how to benefit from the new skills they have acquired.

It is clear that continuing this program is important. We discussed with Drs. Joe Hopkins and Hannah Valentine, who lead this effort for SHC and SoM respectively, the idea that broadening the participants in future sessions to include faculty from basic as well as clinical science departments would enrich the program further. Equally importantly, it would enhance the dialogue and communication between these important communities and have the broader benefit of further aligning our missions and goals.

I want to thank in particular Dr. Joe Hopkins, who really led the way in putting this program to together. Clearly he also won the admiration of all who participated. I also want to acknowledge the partnership between Drs. Hopkins and Valentine, who have worked well together. It is clear that this joint program is off to a terrific start – and that our institutions as well as the individuals who participated will be the beneficiaries of this combined program.

Some Special Events

Cancer Education for the Community: On Tuesday evening, May 9th we held a special community forum entitled: *Beneath the Surface: How Biomedical Insights are Changing Cancer Care*. Some 70 community members attended the evening symposium and breakout sessions at the Bechtel Conference Center. Following a keynote address by Dr. Beverly Mitchell, Deputy Director of the Stanford Comprehensive Cancer Center and the George E. Becker Professor Medicine on “*Enhancing Connections Among Scientists, Clinicians and the Cancer Community*,” attendees had an opportunity to participate in two of four breakout sessions. These included:

Focusing on Prostate Cancer, led by Drs. Jim Brooks and Steve Hancock
Controlling Cancer Stem Cells, led by Dr. Mike Clarke

Detecting Women's Cancers, led by Drs. Ellie Guardino and Amreen Husain

Tracking Genetic Risks, led by Dr. James Ford

Each of these sessions was highly informative and, based on my own observations, much appreciated by the attendees. Especially in the context of the importance of continuing to educate our community, this event was a wonderful success. I want to thank our faculty for committing their time and energy to this community forum as well as the members of the Office of Medical Education for all that they did to make it so successful.

Improving Diversity in Graduate Education: On Thursday, May 11th the School of Medicine sponsored the 2006 Symposium on Improving Diversity in Graduate Education – the third in a series of such events. This year's speaker was Dr. Claude Steele, the Lucie Stern Professor in the Social Sciences at Stanford and presently, the Director for the Center for Advanced Study in the Behavioral Sciences. Professor Steele gave an enormously compelling presentation on the "Psychology of Social Identity: Its Role in Group Performance Differences and the Challenges of an Integrated Society." I want to thank Drs. Hannah Valentine and Ellen Porzig along with Anika Green and Barbara Miller, as well as the Committee for Graduate Admissions and Policy, for their efforts on behalf of this important symposium.

Awards and Honors

At the recent Pediatric Infectious Disease Annual Meeting **Manuel Amieva, MD, PhD**, Assistant Professor Pediatrics (Infectious Disease) was the recipient of the Young Investigator Award – a major recognition of his rapidly developing career as a physician-scientist. In addition, **Dr. David Hong**, Fellow in Pediatric Infectious Disease, won the Wyeth Laboratories Fellowship Award.

Anne Brunet, PhD, Assistant Professor of Genetics, is one of five Stanford faculty members to receive the 2006 Sloan Research Fellowship. The fellowships are designed to help promising young faculty members freely pursue their research interests.

Natalie Dye, Graduate Student in the Department of Chemistry, has been awarded the Lieberman Fellowship for the School of Medicine. This fellowship is named in honor of one of Stanford's most distinguished citizens, Provost Emeritus Gerald J. Lieberman, and honors the qualities of outstanding scholarship, teaching, and university service.

Peter Lee, MD, Assistant Professor of Medicine (Hematology), and **Jon Pollack, MD**, Assistant Professor Pathology, were among the 64 new members recently elected to the *American Society for Clinical Investigation*, an honor society of physician-scientists founded in 1908 to recognize individuals who have made significant contributions to the translation of knowledge from the laboratory to the advancement of clinical practice. Of the 2800 members in the ASCI, 51 are at Stanford.

Lubert Stryer, MD, Mrs. George A. Winzer Professor of Cell Biology, Emeritus has been nominated to the American Philosophical Society. The American Philosophical Society was founded by Benjamin Franklin in 1743. It honors extraordinary accomplishments in all fields, including the sciences and humanities.

Irv Weissman, MD, Virginia & D.K. Ludwig Professor for Clinical Investigation in Cancer Research, Professor of Dev Bio & by courtesy of Neurosurgery & Biological Sciences, and Director of the Institute for Cancer/Stem Cell Biology and Medicine, will receive an honorary doctor of science degree from Columbia University. Dr. Weissman's research extends to the possible stem cell origins of leukemias and other malignancies and has spawned new designs for more effective cancer therapies.

Congratulations to all!

Appointments and Promotions

- **David L. Berger** has been promoted to Adjunct Clinical Professor of Anesthesia effective 4/1/06.
- **Edmund J. Harris Jr.** has been promoted to Professor of Surgery effective 5/1/06.
- **Sabine Kohler** has been promoted to Professor of Pathology and Dermatology effective 5/1/06.
- **Natalie Rasgon** has been promoted to Professor of Psychiatry & Behavioral Sciences, effective 5/1/06.
- **Christy Sandborg** has been promoted to Professor of Pediatrics at the Lucile Packard Children's Hospital, effective 5/1/06.
- **Raymond Sobel** has been promoted to Professor of Pathology effective 5/1/06.
- **David Weill** has been appointed to Associate Professor of Medicine (Pulmonary and Critical Care) effective 5/1/06.
- **Cynthia Wong** has been appointed to Assistant Professor of Pediatrics at the Lucile Packard Children's Hospital effective 5/1/06.

Dean's Newsletter May 30, 2006

What is the Status of Our Medical School Education Programs?

Over the past five years, the partnership between the Dean's Office, led by Dr. Julie Parsonnet, Senior Associate Dean for Medical Education, and the Medical School Faculty Senate, led sequentially by Drs. Lorry Frankel, Oscar Salvatierra and Ray Gaeta, has resulted in the continued evolution and transformation of the Stanford Medical Student Curriculum. The New Stanford Curriculum was launched with the class that entered in the Fall of 2003. Some of the changes we made in the New Curriculum have

also been adopted by other medical schools, while others remain unique to Stanford, although these have attracted attention and will likely be copied by some of our peer schools, including Harvard Medical School. Since 2003, further development has occurred, and the New Curriculum continues to be very much a work in progress.

For example, over the past decade a number of medical schools across the country, including Stanford, have recognized the importance of better aligning science and medicine throughout medical school. This is a welcome departure from the increasingly outmoded “preclinical” (i.e., basic science) and “clinical” divisions of the curriculum that traditionally divided the four years of medical school into halves. The New Stanford Curriculum seeks to accomplish this alignment by starting the basic and clinical science components of modern medical education at the outset of medical school. However, the continued growth of knowledge in both science and medicine, as well as in their important interrelations, makes it crucial to look beyond medical school itself and to provide students with a lexicon and roadmap for lifetime learning. The New Stanford Curriculum attempts to provide these tools for lifelong learning, in part by continuing the integration of science and medicine throughout all years of medical education. I have long believed that we also need to continue this integration in a more coordinated manner during the transition from undergraduate medical education to residency and fellowship training. And while we have made a slight bit of progress in this area, we need to do much more. I hope we can successfully address this large unmet need during the years ahead.

One of the most distinctive aspects of the New Stanford Curriculum is the Scholarly Concentration, which is now required for all students who entered since August 2003. The Scholarly Concentrations are, in part, the result of an evolutionary process of change that goes back to the Medical Scholars Program and even further, to the so-called “Five Year Plan” that characterized Stanford Medical School in the 1960’s. Presently, there are 12 Scholarly Concentrations that offer a broad range of opportunities for learning and research or that permit students with specific interests or needs to define an individualized program of scholarship and research. From my point of view, the Scholarly Concentrations truly distinguish Stanford from other schools and emphasize both our academic strengths and our commitment to scholarship and research.

At the Medical School Faculty Senate meeting on Wednesday, May 17th, two presentations provided updates on the status and assessment of the Scholarly Concentrations. Dr. Russ Altman, Associate Professor of Genetics and Director of the Scholarly Concentration in Biocomputation, gave the first presentation. Dr. Altman reminded us of the mission statement that has guided the development of the Scholarly Concentrations:

Scholarly Concentrations are required, structured programs of study in the Medical Student Curriculum that promote in-depth learning and scholarship. The Scholarly Concentrations provide medical students with faculty-mentored scholarly experience in areas of individual interest combined with structured coursework to support this scholarship. This component of the MD curriculum

develops critical thinking, skills in evaluation of new data, and hands-on experience with the methods by which new scholarly information is generated. Building these essential skills for leadership in medicine and research supports the institutional goals of innovation and scholarship and fosters lifelong enthusiasm for the field of Medicine.

This is an ambitious goal, but one that I strongly support. Indeed, if we are to train and develop the leaders and scholars who so clearly will be needed in the future, it is imperative that we work diligently to assure the success of programs like the Scholarly Concentrations. That said, they are challenging, and for students seeking the MD degree, they need to be coupled with equal rigor and excellence in the teaching and learning of clinical knowledge and skills. While we certainly try to offer such a program in the traditional four-year curriculum, my own strongly held belief is that at least five years are needed if students are to have the opportunity to truly develop the foundations for their skills in scholarship, research and clinical medicine. Thankfully, at Stanford, students can do a fifth year without incurring a significant financial burden – something that also distinguishes us from virtually every other medical school in the nation.

Dr. Altman pointed out that the scientific rigor and quality of the Scholarly Concentration research proposals have become increasingly stronger and more impressive during the past couple of years. Also, because they are now so integral to the student experience at Stanford, a brief summary of the student's Scholarly Concentration is included in the "Dean's Letter." I am pleased by this change since it further helps to differentiate and distinguish the excellence of Stanford medical students.

Dr. Altman also briefly discussed the new Applied Biomedical Sciences Program (ABSP) at Stanford, which is designed to maintain a connection to the scientific basis of medicine for students doing clinical rotations. In the ABSP, students will attend plenary sessions hosted by each of the Scholarly Concentration programs throughout the year. This will be complemented by other course work that will be included in the ABSP and which will further assure the active connections between basic and clinical science and medicine.

Efforts are also underway to provide academic homes for Scholarly Concentrations within the relevant Stanford Institute of Medicine. While these types of linkages are important in better aligning our missions in education, research and patient care, it is also important to make sure we avoid having students become narrowly specialized too early in their careers. Careful advice and mentoring are essential to make sure students are making the most optimal choices for their career development.

We are also continuing to assess, evaluate and improve the overall quality and impact of the Scholarly Concentration program. In this regard, Dr. David Fetterman, Director of Evaluation, made the second presentation at the Medical School Faculty Senate meeting. He offered updates regarding the Scholarly Concentrations from the Student Body Survey that was done in preparation for the LCME site visit. It is certainly notable that over 80% of Stanford students had participated in research when the LCME survey was done in 2004-2005 (a percentage I would imagine has further increased) and that the

majority of students found it to be a valuable experience. They reported that their research experience had made them more well rounded, better able to pursue compelling topics, and more competitive in applying for residencies. At the same time, a number of important challenges were identified – all of which need to be (or are being) addressed. These include improving the orientation and communications about Scholarly Concentrations requirements and devising better ways to establish links between students and potential research supervisors. Thanks to the efforts of Dr. Pat Cross, Professor of Structural Biology and Associate Dean of Student Affairs, an on-line communication tool will soon be available to help address these issues. In addition to the need to ameliorate the scheduling conflicts that occurred during the initial phase of the program, students also identified the importance of better standardizing core requirements and expectations for the Scholarly Concentrations.

Importantly, there was considerable overlap in the student assessments of the Scholarly Concentrations and those of the faculty and a commitment to further improve the student experience. Given the stage of development of this program, it is not surprising that deficiencies as well as strengths have been identified. And while there is a commitment to work diligently to rapidly address the problems highlighted by students or faculty, I suspect that there will always be a need for further refinements and improvements in this program – and indeed, in our overall curriculum. No curriculum or programmatic change will remain excellent without such a commitment - which, thankfully, we all share.

Medical Student Research – the Heart of the Matter

Among the things that pleased me most at the 23rd Annual Stanford Medical Student Research Symposium held on May 17th was the enthusiasm and excitement of the students presenting their research – and of those learning about what their student colleagues were working on. In my opinion and experience, the analytic skills developed during a research experience help make one a better physician, whether or not investigation becomes the dominant part of one's career. At the Symposium, 30 students offered 33 poster presentations, as follows:

Student	Faculty Advisor	Topic
Winifred Adams	Donna Peehl	SAHA and androgen receptor induction in primary prostate epithelial cultures
James Andrews	Anthony Wagner	Relating anatomical and functional variability in the inferior frontal gyrus: qualitative vs. quantitative approaches
Roger Bartolatta	Garry Gold	Open MRI assessment of Fryette's Law in lumbosacral mechanics
Bill Bragg	Stuart Goodman	Histomorphometric analysis of the inflammatory response to titanium particles in wild-type and IL-R1 knock out mice

Dora Castaneda	Gary Steinberg	Both signal pathways of MAPK/Erk and PKB/Akt are involved in ischemic damage/survival after stroke in rats
Bruno Chazaro-Cavero	Peter Lee	Immunology of tumor draining lymph nodes in breast cancer
Nina Chinosornvatana	Kay Chang	Grading of ototoxicity
Richard Chiu	Stuart Goodman	Bone marrow mesenchymal stem cells lose their osteogenic potential after exposure to polymethylmethacrylate particles in a non-osteogenic environment
Eric Cornidez	John Broke-Utne	Does hypothermia during neurological anesthesia decrease brain temperature
Emily Curran	Paul Fisher	Gender affects survival from medulloblastoma only as a function of age: a SEER Registry study
Monica Eneriz-Wiemer	Oscar Salvatierra	Successful high-risk renal transplantation of small children with a completely thrombosed inferior vena cava
Rebecca Flyckt	Maurice Druzin	Outcome of pregnancies complicated by systemic sclerosis and mixed tissue disease
Simon Hanft	Theo Palmer	Adult hippocampal neurogenesis and hippocampus-dependent memory are protected by rosiglitazone and indomethacin in the face of a neuroinflammatory stimulus
Andrew Hsu	Victor Tse	In vivo bioluminescence and near infrared fluorescence imaging of orthotopic U87MG-luciferase xenographs: tumor volumen correlation with MR imaging and visualization of integrin $\alpha_v\beta_3$ expression
Yashar Kalani	Roel Nusse	Wnt proteins as tools to manipulate neural stem cells
Jessica Les	Jose Montoya	Perception of pregnant women toward threat of congenital toxoplasmosis in Cali, Columbia
Jason Liauw	Gary Steinberg	Neural progenitor cells enhance symptogenesis in neuronal cultures: a thrombospondin dependent mechanism
Helen Liu	Howard Chang	Role of the developmental gene SALLA4 in cellular quiescence
Michael Mancuso	Calvin Cu	Egfl7: a novel regulator of angiogenesis
Gladys Martin	Lawrence Hammer	Do parent's perception of their child's weight influence their child's BMI: A cohort study of 150 parent-child pairs of nine years
Everett Meyer	Dale Umetsu	iNKT cells require CCR4 binding of CCL17 to localize to the airways where they are

		necessary and sufficient for inducing airway hyperreactivity
Deepika Nehra	Lawrence Recht	On the origin of gliomas
Delene Richburg	Denise Johnson	Breast MRI and surgical outcomes in young women
Farazad Soleimani	Laurence Baker	Learning from mistakes in New Zealand hospitals: what else do we need besides “No-Fault”
Farazad Soleimani	Henry Greely	Learning from mistakes in US hospitals; what factors do influence error reporting behavior
Joshua Spanogle	Stuart Goodman	VEGF increase in periprosthetic osteolysis is secondary to increased numbers of macrophages at the bone-implant interface
Victor Tubbesing	Bradley Hill	Decellularization procedures for small-caliber vessels: cellular and biomechanical evaluation
John Van Arnam	Mark Krasnow	A transgenic mouse for the clonal analysis of pulmonary mesenchyme
Anand Veeravagu	Victor Tse	Characterization of angiogenesis in GL26 murine-derived glioblastoma multiforma using dynamic contrast enhanced MRI
Jenny Wilson	Rebecka Peebles	<ol style="list-style-type: none"> 1. Ethnicity and bone mineral density in adolescents with eating disorders 2. Self-injury in adolescents with eating disorders: correlates and physician bias 3. Surging for thinness: identifying a methodology

I recognize that these projects represent but a sampling of the research currently being pursued by our medical students, but the broad diversity of interests and topics being addressed is certainly notable – and impressive. I want to congratulate all the students who presented this year and thank their advisors and mentors. I certainly look forward to witnessing the work of future students in the years ahead!

A Big Week for Cancer Programs at Stanford

Approximately four years ago I charged a task force led by Professor James Nelson, Senior Associate Dean for Research, Graduate Education and Postdoctoral Affairs at the time, to examine the future institutional role of the School of Medicine in cancer research, treatment and prevention. Stanford was then, as it is today, widely recognized for its many fundamental contributions to cancer biology as well as its groundbreaking innovations in cancer treatment. Yet it was one of the only medical schools in the country that was not an NCI-designated Comprehensive Cancer Center. As always, there was a history behind this curious situation.

I had been informed soon after my arrival at Stanford in 2001 that various attempts had been made over the years to become a comprehensive cancer center but that each had

been foiled for one or another reason – largely having to do with different perceptions of mission or with resource allocation issues. Having spent some 23 years as a physician-scientist working in the Intramural Program of the National Cancer Institute, I confess a strong bias in favor of Stanford becoming an NCI-designated Comprehensive Cancer Center (CCC). That said, the institutional commitment to such an effort is enormous, and it was important that the faculty consider the issues carefully and determine the best course of action. Indeed, even the application to become a CCC requires clear evidence of institutional support in such areas as the authority of the institute, the allocation and governance of space and faculty positions, and evidence of medical center wide financial contributions and commitments. In spite of these challenges, the task force felt that we should attempt to achieve this status.

As you know from previous Newsletters (http://deansnewsletter.stanford.edu/archive/01_23_06.html, http://deansnewsletter.stanford.edu/archive/02_06_06.html), we have been working toward this goal since the task force recommendation almost four years ago. On February 1st, 2006, we submitted our Comprehensive Cancer Center Application to the NCI. On May 23rd, we hosted the 24-member Site Visit Team and its 6 scientific administrative staff from the NCI. This was obviously a long-anticipated event. Countless individuals have worked with great resolve and commitment to move our application forward and bring us to the moment of the site visit. Dr. Karl Blume began to organize our efforts in February 2003 and did an extraordinary job of bringing diverse faculty interests into focus. Indeed, without his many contributions, as well as the critical reviews from three External Advisory Group assessments of our program, I doubt we could have succeeded in getting to this point. Along the way we were most fortunate to persuade Dr. Irv Weissman to take on the role of Principal Investigator. Because of his knowledge, skill and tremendous respect at Stanford and beyond, Dr. Weissman was able to engage our broad community in a very positive way. Indeed, as part of this process, Dr. Weissman even became an administrator (no further comments needed!). We were also most fortunate to recruit Dr. Steve Leibel from Memorial Sloan Kettering to be the Clinical Director of our burgeoning Center and Dr. Bev Mitchell, from the University of North Carolina, to serve as the Deputy Director. The addition of Ms. Joanne Murphy, Associate Director for Administration, completed the leadership team. Together have done a spectacular job in guiding the preparations of the grant and the site visit.

While the leadership team has proven critical, the soul of the NCI proposal lies of course in the 10 Program Projects and 10 Shared Resource Proposals that comprise the grant. Each of these proposals presents innovative, compelling and forward-looking opportunities to advance knowledge and translate discoveries to improve the diagnosis, treatment and prevention of cancer. These exciting research programs, along with the organization, focus, and evidence of institutional commitment to cancer, were presented to the Site Visit Team on May 23rd. I attended virtually all of the presentations and am proud to say that Stanford did a wonderful job. The presentations by the PI's and Co-PI's were compelling and complemented nicely the 1200 written pages that were submitted to the NCI in February. They tell a story of an institution that is ready and able to make a tremendous difference in the future of cancer research, care and prevention.

In tandem with our many efforts on the Comprehensive Cancer Center proposal, we have also been engaged with the Ludwig Foundation in an attempt to become one of six Ludwig Cancer Centers in the United States. This initiative began with the same task force that recommended that we pursue the CCC grant. I have been meeting with leaders at the Foundation for close to five years about this prospect, and Dr. Irv Weissman prepared the Ludwig Center proposal that we submitted to them. On May 22nd, along with Doug Stewart, Associate Vice President for Medical Development and Howie Pearson, Director of Principal Gifts and Development Legal Counsel, from the Office of Development, I visited with the Ludwig Foundation in New York City. At that meeting we learned that Stanford will indeed be a Ludwig Center and that we could make an internal announcement to that regard. This is wonderful news since it will supply strong financial support to our research programs in cancer and cancer-stem cell biology in perpetuity. I want to especially thank Dr. Weissman for his efforts on the proposal.

It will be summer before we know the results of the NCI's deliberations on our proposal to become a Comprehensive Cancer Center, and we all recognize that nothing can be guaranteed. But I must say that, regardless of the outcome, I was very proud of Stanford faculty on May 22nd and 23rd. We have virtually achieved our goal of becoming a Ludwig Center, and we have surely made a very good case to the NCI about our resolve to become a Comprehensive Cancer Center. At a minimum, after more than 30 years of deliberation, Stanford has at least made the application - this alone has helped to excite our faculty and to develop a community of scholars committed to cancer!

I am deeply appreciative to all of the leaders who have gotten us to this important stage. But I am particularly indebted to our exceptional faculty and staff whose work is nonpareil and forms the basis for future hopes and accomplishments. It was a big week for Stanford's cancer programs and I am hopeful that this is just the beginning.

Addressing the Challenges of Diversity with Integrity

Since coming to Stanford one of my highest priorities has been to enhance the diversity of the School of Medicine and to do all that we could to foster a "Respectful Workplace." We have worked diligently, expeditiously and definitively to address any evidence of disrespectful behavior. Indeed we have had a zero tolerance policy regarding any reported infractions. Further we have been working assiduously to do everything we can to enhance diversity and promote career development. While there is no denying that we still have much work to do, I do feel that we have made progress and that senior leaders, particularly Drs. David Stevenson and Hannah Valentine, have worked beyond expectation to assure the integrity of our work place and the career development of students and faculty. Thus it was most disconcerting to find a highly critical and egregiously inaccurate article in the *Stanford Daily* about our work environment and our respect for women and minorities. While I am certainly open to receiving criticism, this article violates every principle of appropriate journalism and is lacking in scholarship and integrity. Together with Drs. David Stevenson and Hannah Valentine, we have submitted the following letter to the editor of the *Stanford Daily*. Separately, the Provost is also

registering his very serious concerns about the report. It is most unfortunate that such irresponsible journalism attempts to damage the integrity of our school. Here is the letter we submitted:

Dear Editor,

We appreciate the importance of student journalism. We also value responsible critiques of our progress and efforts as we attempt to address the challenging and important issues of equity and career development in academic medicine. Indeed, we have worked diligently during the past several years to address historical inequities and to make Stanford School of Medicine a leader in academic career development that values all forms of diversity. Thus, as the senior leaders for diversity, academic affairs and dean of the School of Medicine, we are compelled to voice our deepest concerns regarding the content of your article of May 25, 2006, entitled, "Med School Faculty Claim Systematic Discrimination." The portrait offered by Ben Eppler is highly distorted. The article confuses issues of the past with the facts of the present and fails to offer any context or verification for the extraordinarily biased and derogatory claims put forth by the writer and his "anonymous sources." Sadly, this striking example of irresponsible journalism occurred in part because the writer chose to ignore pertinent information provided to him. Mr. Eppler chose instead to write an article based on unfounded allegations and insinuations, lacking in facts, riddled with innuendo and grossly inaccurate. Most importantly, his comments about women or minority faculty members in leadership positions constitute a direct attack on their competency, and they denigrate the many contributions these individuals have made in ensuring that Stanford has among the most diversified student bodies in the nation as well as a highly respectful workplace for faculty, students and staff. We cannot even speculate why the author chose to ignore important facts or to offer (as if they were facts) insinuations about the role of the government in suppressing a federal investigation – a notion that is totally ludicrous and categorically false.

The significant accomplishments that have occurred in the past several years to improve diversity and leadership by women and minorities in the School of Medicine have included revisions of the search process; education of search committees around issues of unconscious bias; and provision of resources to broaden the diversity of applicant pools. In addition, we have created major opportunities for leadership development of students and faculty and have, for the past five years, had a focused effort on the "respectful workplace" that has been a model for the university.

We clearly recognize that we have work to do to achieve the level of diversity and balance we seek for the school of medicine. We are proud that we have advanced this process in a multitude of ways with the highest degree of integrity, openness and transparency. Quite frankly, that is what makes this article so distressing. In its distortions and dearth of factual content, it is highly disrespectful of both the

individuals and the institutions that are working diligently to improve personal and professional development.

Launching Plans for a CTSA Application

In 2005 the NIH announced plans for Clinical and Translational Science Awards (CTSA), which have as their goal the engagement of medical schools and academic medical centers in fostering the career development of future clinical and translational investigators. When the program is mature the CTSA will become the funding umbrella for the General Clinical Research Centers as well as institutional training awards (e.g., K12, K30, T32). For the first round of CTSA submissions, which were due April 1, 2006, an institution could apply for either the full grant or a training grant. Because we were already deeply committed to submitting our grant proposal to the NCI on February 1st to become a Comprehensive Cancer Center (see above), we elected to submit a planning grant with the recognition that we would submit the full grant proposal during the next cycle in 2007. I want to thank Dr. Mike Longaker, Deane P. and Louise Mitchell Professor, who did an excellent job in leading the effort for the planning grant submission.

During the last several weeks we have carefully considered the best way to optimize our efforts for our CTSA grant submission, which is due at the end of January 2007. While the CTSA is a new program, we have actually been preparing for it for the past several years under the banner of our strategic plan *Translating Discoveries*. Our dedication to educating and training physician scientists has taken several programmatic forms. One is the Scholarly Concentration in clinical research in the Medical Student Curriculum. Another is the new Masters in Medicine program, which aims to provide substantive exposure to the challenges of clinical and translational research to our graduate students. A third is our planned program for Advanced Residency Training at Stanford (ARTS), which will enable selected residents and fellows interested in research to pursue graduate studies. All of these speak to a significant focus on educating and training a cadre of physicians and scientists who will be committed to clinical and translational research. The CTSA will help us further focus and refine these efforts with even more specific venues for educational opportunities. Along with our ongoing programs in education, the establishment of the Stanford Institutes of Medicine and their close alignment with the Centers of Excellence at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital also speak to our institutional commitment to translational and clinical research and its application to improving patient care. Thus, I believe that we are well positioned to prepare a strong application for the CTSA grant proposal.

Based on discussions with the NIH and with colleagues at other centers, we know that the institutional commitment to the CTSA must be further underscored by having a significant leader serving as the principal investigator. Because of Dr. Longaker's understandable desire to focus on his important leadership role in the Program for Regenerative Medicine and his own research program, I have asked Dr. Harry Greenberg, Senior Associate Dean for Research, to assume the role of PI for the CTSA. Thankfully he has agreed to do so and is now beginning to assemble the leadership team necessary to prepare this grant. Because of the broad umbrella that the CTSA extends over all of our

programs in translational and clinical research and education, it will loom large in our planning and have a significance that is equivalent to our efforts to become an NCI-designated Comprehensive Cancer Center. Accordingly, I will certainly be providing updates about our planning for the Stanford CTSA.

Addressing the SHC Medical Staff on Stanford and the Challenges Facing Academic Medicine Early in the 21st Century.

On Wednesday evening, May 24th, I had the opportunity to address the Medical Staff on current and future challenges facing academic medicine and the role Stanford might play in addressing them. Specifically, I identified five major intersecting issues now emerging in American medicine and science and discussed how Stanford can play a role in addressing them – either to directly or through advocacy. As is often the case, each opportunity has an opposing or juxtaposing force. Thus finding ways to align the positives as well as to attenuate or eliminate the negatives constitutes an important aspect of our Stanford mission. While a number of additional factors can be identified, the following are the ones I chose to highlight:

1. The strong support the American public and the US Congress have shown for biomedical research during the past several decades that is now being threatened by the rising anti-science sentiment permeating Washington, the US and even the world. This is accentuated by the politicization of science and by the move toward theocratic thinking in our country.
2. The remarkable opportunities in science, innovation and technology resulting from our nation's investment in biomedical research during the past 50 years that are now being negatively impacted by the decreased funding through the NIH and CDC – with potentially very serious consequences for academic medical centers.
3. The improvements that have occurred in health care as a result of innovations, technology and research juxtaposed against the skepticism regarding the excellence of health care and, more importantly, the clear inadequacy of our health care system.
4. The opportunities to translate knowledge from the laboratory to the bedside that are fostered by interdisciplinary research and productive interactions with industry but that can also become mired in controversy by reports of institutional and individual conflicts of interest and a sometimes convoluted entanglement of academia with industry.
5. The once esteemed societal position held by physicians and scientists in the eyes of the public that has, in various ways, been diminished by the market driven changes in the health care system and the lack of time and personal contact physicians can have with their patients.

Certainly these are important if not daunting challenges, and it is appropriate to ask why one would think that a single institution could play a role in addressing them. But change must start somewhere, and I believe that Stanford is a unique environment in which we have the opportunity to impact each of these issues – or at least to bring them to wider public attention, debate and engagement.

Perhaps first and foremost it is essential that we stay true to our missions in education, research and patient care and that we seek ways to align and integrate them. I have previously addressed this issue and my conviction that we are making progress by defining our missions under the banner of *Translating Discoveries* (http://deansnewsletter.stanford.edu/archive/02_06_06.html#1). At the same time, we are served by leading or participating in national advocacy for research and by combating the anti-science movement through education of the public and of congressional constituencies at the local, state and federal levels.

We also need to be willing to play an active role in the reform of health care rather than simply letting it unfold in a reactive manner. Doing this in partnership with public and private partners is a reasoned approach, and it may help stimulate a process for change. But significant change will also require the resolve of the government – which is unlikely until public outcry is loud enough to stimulate real reform. While quality of care is important and is increasingly becoming the focus of incentives for physician performance, improvements in the quality of health care delivery without new interventions emanating from discovery and innovation will not truly advance our health care agenda.

We also need to forge more transparent relations with industry and forego the gifts of subtle persuasion and coercion that have come to characterize modern medicine. We have been working on policies to address this matter – and two leading peer schools, Yale and Penn, have already come forth with impressive guidelines.

We also need to bring back some of the past respect of medicine as a valued profession. Of course it is fantasy to think of Marcus Welby as the model for American Medicine but it is appropriate to consider ways of re-engaging the public trust. We are understandably focused on innovation, technology and things that distance the physician from the patient – but we need to train our students and residents in the art of medicine. This might be accomplished by establishing a Center for Educating the Compassionate Physician. We must convey to the public that we care about individuals and that we are seeking ways to combine humanism with technology as essential parts of the art and science of medicine.

Clinical Trial Reporting and Registries

I have previously communicated the efforts of the Institute of Medicine (IOM), the AAMC and others to address the thorny issue of clinical trial reporting (see: http://deansnewsletter.stanford.edu/archive/05_16_05.html). As a result of these efforts, which also included the International Committee of Medical Journal Editors (ICMJE), a

set of guidelines was established and published in lead journals (including the NEJM and JAMA) that focus on reporting clinical trials in Clinical Trials.gov (see <http://www.iom.edu/CMS/3740/31272/32232.aspx>). The absence of registry reporting would mean that the clinical trial would not be published in one of 11 (or more) leading journals.

Last fall the IOM Health Science Policy Board agreed to work collaboratively with the World Health Organization (WHO) to review the data regarding this important issue. In the past week, the WHO indicated that research universities and industry should disclose key details regarding clinical trial, such as whether they involve patients or healthy volunteers, and that they should do so at the earliest stages of these studies. The WHO's new International Clinical Trials Registry Platform would not be a register itself, but rather would provide a set of standards for all registers, the agency said. These standards would include disclosure of sources of financial support for a trial, lay language explaining the study, conditions and countries of recruitment of people on whom treatments were tested, age and gender data, sample sizes and information on the key outcomes of a test. This decision on the part of WHO is welcome additional progress towards appropriate clinical trials disclosure and transparency.

Dr. Larry Leung Appointed Chief of Staff at the VAPAHCS

I am very pleased that Dr. Larry Leung, the Maureen Lyles D'Ambogio Professor of Medicine, has been named the Chief of Staff at the VAPAHCS (Veterans Affairs Palo Alto Health Care System). His appointment follows a national search and was announced this past week by Ms. Lisa Freeman, Executive Director of the VAPAHCS.

Dr. Leung has a long record of accomplishment as a Stanford faculty member in the Department of Medicine and, since 2004, as the Chief of the Medical Service at the VA and Senior Associate Chair of the Department of Medicine. He also served as the Acting Chief of Staff at the VA following Dr. Javaid Sheikh's departure from this role in February 2006.

I am confident that Dr. Leung will continue the excellent work begun by Dr. Sheikh in helping to align the VAPAHCS and the School of Medicine. We share important missions in education, research and patient care and have each benefited from our enhanced collaborations. In addition to thanking Drs. Sheikh and Leung, I also want to express my appreciation for the important role that Ms. Lisa Freeman has played in helping our institutions to become better aligned. I look forward to even closer relationships in the years ahead and am confident that these will be achieved.

Dr. Gabe Garcia Appointed Head of the Haas Center for Public Service

Provost John Etchemendy announced on May 24th that Dr. Gabe Garcia, Professor of Medicine and Director of Admissions for the School of Medicine, has been appointed to head the Haas Center for Public Service (see Stanford Report: <http://news-service.stanford.edu/news/2006/may24/haas-052406.html>). Dr. Garcia has had a long commitment to public service and is highly regarded throughout the School of Medicine by students, faculty and staff for his many important contributions. I am also very pleased

that his accomplishments are equally recognized throughout the University and that his appointment will provide an opportunity for even greater alignment of medicine and public service. This is wonderful news for Dr. Garcia and for Stanford.

Dr. Garcia's leadership role at the Haas Center will require approximately half of his time. I am also pleased that he will continue his excellent work as director of admissions and as a faculty member in the Department of Medicine at Stanford.

Upcoming Events

Community Lecture Series

Dr. Gary Glazer, Professor and Chair of the Department of Radiology, will speak about "The Changing World of Medical Imaging" at the final Community Lecture Series of the academic year,. He will cover the progress of new tools that have revolutionized imaging and discuss the various new ways imaging can be used inside and outside of medicine. The lecture will be held on Wednesday, June 7th at 7:00 in the Clark Center Auditorium.

Awards and Honors

We are pleased to recognize the following individuals for their outstanding achievements. Congratulations to all!

- ***Drs. Paul Berg and Lubert Stryer*** were honored on Tuesday May 16th at a ceremony where Affymetrix announced that it would name fellowships for Stanford graduate students after them. As you may know, Drs. Berg and Stryer are among the most notable figures in American science and have distinguished Stanford careers. I am confident that it will be inspirational for future graduate students to hold a fellowship named after these pioneering giants.
- ***Dr. Samuel LeBaron***, Professor of Medicine (Family and Community Medicine), has been awarded the 2006 California Family Physician of the year by the California Academy of Family Physicians. The CAPF annually honors a family physician who represents the finest characteristics of the specialty, and goes above and beyond in service to patients, colleagues and the community. Dr. LeBaron has been an inspiration for colleagues, students and patients. Locally, he has been involved in both helping communities in the area and in developing medical programs at Stanford and O'Connor Hospital. Internationally, he has traveled around the world, presenting talks and conferences as well as developing programs for medical students in various countries.
- ***Dr. Anna Penn***, Assistant Professor of Pediatrics, has been named a 2006 John Merck Scholar. The award will support Dr. Penn's research activities. This is a wonderful achievement and a tribute both to Dr. Penn and to Stanford.

- **Dr. Ted Sectish**, Associate Professor of Pediatrics, was awarded the Walter W. Tunnessen, Jr., MD Award at the Association of Pediatric Program Directors for his nationally recognized role in advancing postgraduate pediatric education.
- **Richard Chiu**, Graduate Student in the Department of Medicine, has received the Klea D. Bertakis Award for one of the five best overall oral presentations at the 2006 Western Student Medical Research Forum for his work, “Polymethylmethacrylate Particles Inhibit Osteoblastic Differentiation of Bone Marrow Osteoprogenitor Cells in Vitro.”
- **Geoff Krampitz** was announced as the winner of the AMA Foundations Minority Scholars Award. Geoff was one of ten students selected for this award from a group of 120 nominees across the nation. The award is based on personal commitment and scholastic achievement.
- **Robert Rafael Ricardo-Gonzalez**, a doctoral student in Medicine/Immunology, has been awarded the Student Gores Awards for Teaching Assistants.
- **Stanford Medicine**, the School’s official magazine, recently won seven important awards from CASE, including the gold medal for staff writing. The competition included all university publications and thus is a great tribute to **Rosanne Spector**, editor for Stanford Medicine, as well as **Paul Costello**, Executive Director of Communications and Public Affairs and the Communications staff. Over the recent years **Stanford Medicine** has become a topic driven publication and has addressed important and timely issues – ranging from stem cell research and health care reform to the most recent issue that deals with evolution. This is a wonderful recognition that not only brings distinction to Stanford but which also allows our voice on important issues to be heard around the nation and world.

2006 Faculty Award Nominees

Bloomfield Award

Laura Bachrach	Pediatrics (Endocrinology)
Erika Schillinger	Family Medicine

Ebaugh Award

Kuldev Singh	Ophthalmology
--------------	---------------

Kaiser Clinical Teaching Award

James Baxter	Internal Medicine
Samuel LeBaron	Family & Community Medicine
Sherry Wren	Surgery

Kaiser PreClinical Teaching Awards

Laurence Baker	Health Research and Policy
Lawrence Mathers	Pediatrics Intensive Care

Robert Siegel Microbiology & Immunology

Kaiser Innovation Award

Peter Rudd General Internal Medicine

Rambar Mark Award

William Benitz Pediatrics – Neonatology

Award for Service to Graduate Students

Bill Weis Structural Biology

Award for Graduate Student Teaching

Arend Sidow Pathology and Genetics

Appointments and Promotions

- David L. Berger has been promoted to Adjunct Clinical Professor of Anesthesia effective 4/1/06.

Dean's Newsletter
June 12, 2006

A Major and Well-Deserved Honor for Dr. Len Herzenberg

Professor Len Herzenberg is truly one of the 20th century's leading innovators in human biology. In the mid 1960's he recognized that an optics and laser device being developed at Los Alamos might be used to individually identify and then separate and sort closely related live cell populations. Working collaboratively with physicists at Stanford, Professor Herzenberg developed a prototype of what would eventually be known as the Fluorescence Activated Cell Sorter (FACS). By 1975 the FACS had become more broadly available through Becton-Dickenson. Since then it has transformed the diagnosis and monitoring of a wide array of diseases - particularly cancer, infectious disease and immunological disorders - and has shed fundamental light on a number of biological processes. The FACS was also instrumental in permitting the isolation of the first human hematopoietic stem cells and is critically important to stem cell biology today. Indeed the FACS has been one of the most important medical instruments ever developed. As just one example, in the early 1980s, the FACS was used in the work that led to fundamental insights about the impact of the Human Immunodeficiency Virus (HIV) on the immune system, and it was a valuable tool for the diagnosis, monitoring and, ultimately, the treatment of AIDS. For his seminal work on FACS, Len Herzenberg was named the recipient of the 2006 Kyoto Prize. He first learned about this distinguished award in a phone call at 11:30 pm on Thursday June 8th. I should also add that Len's life-long partner Professor Lenore Herzenberg has played a critical role in these important discoveries.

The Kyoto Prize is awarded annually to persons who have made significant contributions in the three categories of Advanced Technology, Basic Sciences, and Arts and Philosophy. Through this Prize, the Inamori Foundation seeks not only to recognize outstanding achievements but to promote academic and cultural development as well contribute to mutual international understanding.

We had an opportunity to celebrate Len's latest award at a late morning reception in the Dean's Courtyard on Friday June 9th. Mr. Jay Scovie, North American Liaison for the Inamori Foundation attended the reception and helped us to acknowledge Professor Herzenberg's remarkable contributions.

Please join me in congratulating Dr. Herzenberg and the Herzenberg family and Lab.

Getting Ready for Commencement 2006

Stanford University's 2006 Commencement will be held on Saturday June 17th and Sunday June 18th. Because of the renovations being done at Stanford Stadium, this year's commencement will occur in two phases. On Saturday June 17th the graduate and professional school commencement activities will take place on Elliott Field beginning at 9:30 am. This year's commencement speaker is Vartan Gregorian, President of the Carnegie Corporation and former president of the New York Public Library and Brown University.

Following the official University Commencement, the School of Medicine will hold its Certificate Ceremony on the Dean's Lawn. The festivities will begin at 11:30 am with a luncheon on Alumni Green. Graduates and their families are all welcome to attend.

At 1:30 pm the faculty processional will commence and the School of Medicine Ceremony will be held in the tent on the Dean's Lawn. Family and friends are invited. We are anticipating that 92 students receiving their MD degree will attend the ceremony along with 35 graduates receiving their PhD degree and six their MS degree. The graduate and medical students have selected two students to speak on their behalf: Iwei Yeh will represent the PhD students and Jason Karamchandani will represent the medical students.

A special Dean's Newsletter on June 19th will list the awards bestowed upon School of Medicine faculty along with the commencement remarks by our two graduating students.

Thinking About Career Development

During my career in academic medicine I have had considerable involvement in career development, particularly for clinical science faculty. Although much of this has focused on training pediatric physician-scientists, a number of the principles and issues are applicable to other career tracks. I had the opportunity to visit some of these issues at a recent seminar with Pediatric Fellows that also included Drs. Harvey Cohen, Arline and

Pete Harman Professor for the Chair of the Department of Pediatrics, and Charles Prober, Professor of Pediatrics and of Microbiology and Immunology.

I view this as more of a conversation about academic career development than as a set of proscriptive rules or guidelines, and I offer some of these reflections in this Newsletter with the hope that they might be of value to our Stanford community. I recognize that this discussion is more relevant to clinical trainees but hope that it will have some value to basic science trainees as well – if only to share the scope of challenges and experiences that are involved with different career paths. I will focus my comments around ten key questions:

Why consider a career in academic medicine?

I have been a participant in academic medicine and biomedical research for three decades. The reasons that motivated my initial engagement still apply today and are likely relevant to those who choose this career path. Perhaps greater than any other motivating factor is the strong desire to contribute to discovery and innovation along with an equally strong motivation to push the boundaries of knowledge. These are often coupled with the excitement of being part of a “learning environment” where knowledge continues to flow and to shape one’s own personal repertoire.

For clinical trainees, the paths toward academic medicine could range from an investigative one involving laboratory research to one that engages advanced clinical medicine and addresses the constantly changing landscape of clinical care – which, in academic settings, almost always includes a much greater focus on tertiary and quaternary care. In addition, there is the opportunity to intersect with exceptional colleagues across multiple disciplines and to participate in teams that include basic and clinical colleagues.

Of course one of the wonderful attributes about academic medicine is the opportunity to train (as well as learn from) exceptional students, residents and fellows. There is very much the sense – and indeed it is a reality – that being in an academic setting affords the opportunity to keep one’s knowledge at the “cutting edge” and to become a thought leader and “go to” person for specific areas of expertise. This high level of expertise is almost always coupled with the development of a national and international network of colleagues (and friends), often through travel and participation in research or academic/professional societies. By definition, this permits a career path that has the potential to change and evolve in a manner that would be hard to replicate in almost any other setting. For example, depending on the situation, an academic medicine faculty member could move back and forth from basic to clinical research and/or patient care; could be involved in undergraduate, graduate and/or postgraduate education; could take on limited or more extensive administrative roles; and could work in a variety of settings – including hospitals, medical school and/or biomedical research institutes.

While for most individuals the advantages of an academic career path include its many professional and personal rewards, there are a multiplicity of issues that can diminish the value of such positions as well. These include the pressures to produce academic scholarship, most frequently measured by peer-reviewed publications. Such scholarship, while essential to academic advancement, can create a burden as well – especially for faculty who also carry significant clinical responsibilities. This reality is exacerbated by the fact that, with rare exceptions, faculty in academic medical centers are dependent on “soft money” from sponsored competitive grants and contracts (e.g., from the NIH) or clinical revenue to support personal compensation and program development. Furthermore, most academic salaries are lower than those in private practice and also come with a number of “unfunded mandates.” While practitioners in medicine always work extensive hours, this heavy work load is especially the case in academic medicine since the time to conduct cutting edge research is not infrequently incremental to patient care and can rarely be accomplished in work weeks less than 60 or more hours.

Certainly the pros and cons must be carefully weighed and balanced, and the decision to enter academic medicine is highly individualized. I can honestly say, however, that being in academic medicine has been one of the greatest privileges of my life and career and that I fully believe the advantages far outweigh the challenges.

What are the opportunities within an academic medical center or research institute?

During the past couple of decades a number of academic medical centers have expanded, thus increasing opportunities for individuals interested in academic medicine. This is particularly the case for physician-scientists as well as clinician-investigators and scholars. While some areas are perhaps oversubscribed (e.g., neonatology in pediatrics), many areas have many more opportunities than available workforce. This includes a number of specialties where a dearth of qualified physician-scientists has reached critical proportions (e.g., psychiatry, pediatrics, obstetrics-gynecology, neurology, and surgical specialties, among others). So matching one's area of interest to opportunities that may exist is clearly important as well.

Equally important is recognizing that there are different roles within academic medical centers that offer quite viable although different pathways. The most defined of these are the Investigator Track, the Clinician/Scholar-Investigator Track and the Clinician-Educator Track. These are defined quite differently depending on the institution and may constitute either completely discrete academic paths or overlapping areas. From my perspective, these tracks serve as guideposts, with the roles of the Investigator and Clinician-Educator perhaps the most stringently defined. More specifically, Investigators (in Stanford nomenclature “University Tenure Line”) require a greater than 80% focus on research whereas the Clinician-Educator is generally assumed to have an 80-90% focus on patient care. The so-called Clinician/Scholar-Investigator (in Stanford

parlance “Medical Center Line) offers perhaps the widest berth since faculty may spend anywhere from 20- 80% of their time on patient care or research – although on average, those in this line devote about 60% of their time on patient care.

In addition to these academic and clinical paths, clinical faculty may also engage in a gradient of leadership and administrative roles, from section/division chief to department chair, dean or, in hospital administration, various vice-president or CEO roles. It is really a matter of finding the right match.

Academic positions can be held in traditional academic medical centers, freestanding teaching hospitals, public institutions (e.g. NIH, CDC), private foundations, professional societies, etc.

How should you select an area of interest?

The key is to choose an area of interest that appeals at every level – intellectually, emotionally, opportunistically, and that offers a sense of passion and an opportunity for commitment. For clinical trainees it is important to recognize that some specialties are more laboratory research intensive (e.g., hematology/oncology) whereas others are more clinical care or clinical research focused (e.g., emergency medicine). Some clinical paths are more longitudinal in patient demands (e.g., oncology, cardiology), some have specific time-blocks (e.g., critical care) and others occur in shifts (e.g., emergency medicine). Further, some areas require being part of a tertiary center or require more specific geographic requirements. Again, it is important to find a balance between personal goals and comforts and the area of focus. It is also important to plan for short, intermediate and long-term horizons (each measured in approximately 10 year intervals) and to also consider ways to create future options that foster renewal or lead to new paths or opportunities.

How to prepare for success: what training is necessary?

As with most career paths, there is no completely right or wrong way – but some preparations lead to greater possibilities for success. For example, if one anticipates a career in academic medicine that has a strong research component, doing research as an undergraduate or during medical school is excellent (if not prerequisite) preparation. The appropriate training also depends on whether the research path being pursued is basic versus clinical, since the latter requires more clinical training and experience in order to optimize success. In general, an academic career requires more training time. Moreover, since most individuals will not have had sufficient research experience during their degree and residency training to enable them to become a successful Principal Investigator, or PI, an extended period of protected time (generally 3-5 years) beyond the terminal degree or residency training period is almost always necessary to develop research proficiency.

Depending on anticipated career directions, there are several ways to prepare for an academic career as a clinical faculty member. If basic laboratory research is a

goal then an MD-PhD program could be the best initial path to choose. At Stanford students can apply for the Medical Scientist Training Program (MSTP) from the outset if they are confident that a combined degree is their goal. However, some students coming to Stanford recognize that they would like to do a PhD in addition to an MD degree only after they have matriculated, and programs are now being put into place to enable joint degree training following the first year of medical school. As part of the New Stanford Medical Curriculum, every student is expected to do research as part of her/his Scholarly Concentration, and this experience can also help inform the decision of whether to pursue an academic career.. Indeed, it is our hope that a large number of our future graduates will pursue academic career paths.

Because we are committed to fostering career paths in academic medicine for our MD graduates, we are also seeking ways to create linkages between the School's education programs and those throughout the University. The Commission on Graduate Education launched by President Hennessy is also designed to open additional opportunities for joint degree education in various other disciplines (e.g., business, engineering, law, humanities and sciences). In addition, we are interested in drawing closer associations between undergraduate medical education and postgraduate training (e.g., residency and fellowships). One program we hope to initiate in 2007 is the Advanced Residency Training Program at Stanford (modeled on the STAR program at UCLA), which will allow residents and clinical fellows who have declared an interest and commitment to pursue research to undertake graduate school training and thus further enhance their prospects for success.

Key to success, of course, is appropriate mentoring and advising. For our medical students the Faculty Advising program should provide the opportunity for early counseling. These opportunities need to be continued, however, through residency, fellowship and beyond so that students and trainees are receiving the best guidance on their career opportunities and strategies for future success.

How should you choose the place to work?

In choosing where to begin and then where to continue one's career there is a panoply of professional and personal choices. Obviously the number of choices or opportunities at one's disposal plays an important role as well as how accommodating or compromising one feels about the nature of the workplace. For most individuals beginning a career in academic medicine, the overall excellence of the program and the range of opportunities it provides for career development and advancement take priority. Many other modifying factors having to do with personal preference are also involved. For example, depending on the nature of one's work it may be important to seek a medical center in a university setting that offers broader interdisciplinary research and education opportunities or, conversely, to seek a more specialized research institute setting. For some it may be preferable to be in a hospital-based setting that is either full service or more specialty-oriented (e.g., children's hospital). A connection to clinical programs

will be important to most clinical faculty but may be less essential to those pursuing more basic research. In addition to traditional academic medical centers and universities, biomedical research institutions such as the National Institutes of Health or the Centers for Disease Control and Prevention can have particular appeal. I can certainly opine on the intramural research program at the NIH where I had the privilege to work as a senior investigator for over twenty years.

In addition to the research, education, patient care and related professional opportunities, other factors also influence the choice of the setting. For most individuals having a sense of the underlying culture is important: how supportive or competitive is the environment and, perhaps most importantly, how does the institution treat and foster the career development of senior fellows and junior faculty. There are, of course, extremes that include, on one hand, centers where turnover is expected after a few years and where tenured appointments are the exception, and, on the other hand, institutions that may be more competitive to enter (e.g., initial appointments are done through a search process) but once appointed, every effort is made to support the junior faculty member's career development. A surrogate for the measure of support is frequently indicated by the "start-up" package that is offered (see below) and the overall commitment provided to supporting junior faculty. Assessing this is often best determined by speaking directly with junior faculty as well as exploring the overall record of success by junior faculty. This is not to say that institutions that have a wider base of junior faculty compared to tenured faculty provide a less optimal training environment. In fact, some of these institutions provide exemplary training and early development opportunities as long as one is prepared for the intrinsic competition often found in this type of institution and the probable need to move to another center for further academic advancement.

Although they are often less important to individuals early in their career, personal choices can play a role. The location of the center, proximity to family and friends, geographic culture and opportunities, large versus small settings, and most importantly, viable career paths for dual career families can each prove important determinants. In my opinion, geographic issues such as weather play a lesser role – but I fully recognize that this is also highly individualized.

Certainly choosing the "right institution" to commence one's academic career is extremely important. The days when faculty seek to move from center to center every several years have dwindled as dual careers, family issues and balance, cost of living and housing have come to play an increasingly significant role. At the same time it is important to never allow oneself to feel overly bound to any one center or institution since doing so can result in compromises that may be quite damaging to one's career development. Thus, even if you think you are in the "best place" it is important to be sure it is serving you well and, if it is not, to know that you feel comfortable with moving on. Ultimately it is incumbent on each of us to provide the necessary protections and self-awareness to permit individualized success that is not contingent on any single institution.

What resources do you need to be successful when you begin your career?

The transition from “postdoc” or clinical fellow is important and can have a defining and even enduring impact on career development and future success. I have discussed above some of the institutional characteristics that can determine whether the right soil is present to help grow one’s career. The right soil needs to be coupled with the optimal nutrients that basically include the resources needed to optimize the chance for success. Of these I think three are essential – and all are necessary in some manner. The first and perhaps foremost are a mentor and a career advisor (ideally these are different individuals) who will help champion one’s nascent career. Mentoring is essential and in the early stages of an academic career can help facilitate everything from successful negotiating and networking skills to grant writing and the ability to interact successfully in one’s institution and beyond. Second, a successful transition from trainee to junior faculty requires financial support along with the protected time to balance the various facets of one’s career portfolio. Third is the availability of the space, equipment and resources to carry out one’s research, whether it is wet or dry lab.

The transition from trainee to junior faculty frequently occurs in the same institution. Unfortunately, when this occurs, it is sometimes not infrequent for the “promotion” to be almost exclusively a change in title but not in resources or a clear development pathway. It is important that the newly appointed junior faculty member know what resources she/he will have to assure success. This is generally referred to as the “start-up package,” and it should include support for salary (generally for three years), laboratory supplies and equipment, defined space and a clearly articulated understanding of responsibilities and the metrics that will be used to assess career advancement. Such a package is more transparently achieved when the appointment of the trainee to be a junior faculty is the result of a national search. The search process necessitates a more clearly defined institutional commitment for the candidate and indicates a plan and role – not just a convenient way of simply expanding a more senior faculty’s workforce. Thus it is important for a newly appointed junior faculty member to fully understand what is being provided, what she/he will need to earn, and what is expected to be delivered. This is not to say that one should never accept a position without a “package” but only that if one does so, it should be with a clear understanding of the reasons why this is being done and, more importantly, how career development will be supported over time.

Having successfully competed for a faculty appointment it is important to understand the institutional rules and culture regarding career advancement, for instance, knowing whether the position is time-limited or tenure track. Some institutions have a very pyramidal configuration with most of the faculty in instructor or assistant professor positions and relatively few at the professorial level. In such a setting it is reasonable to anticipate that career advancement may require relocation. Also in such pyramidal settings, faculty appointments by national search may be less common since subsequent career advancement occurs

by a winnowing process over time. As long as these realities are understood, such faculty appointments can be personally successful.

The alternate model, which exists at Stanford, is for the winnowing to occur during the search process, so that when an appointment is made it is with the understanding that the selected individual may be able to advance within the institution from junior to senior ranks. Of course an initial appointment doesn't guarantee that academic progress will occur – but it begins with that expectation and accordingly, the initial resources provided to optimize the chances for career success.

I am not suggesting that one approach is better or worse than another – as long as one understands the rules and expectations and operates accordingly.

How should you support your career and plan for promotion and advancement?

Career advancement in an academic medical center, teaching hospital or medical school faculty appointments is fundamentally different from traditional university appointments and is based on the combination of performance and financial metrics. Performance is judged according to the track or appointment mechanism and includes, to various degrees, research success, clinical activity, teaching commitments and administrative positions. Schools of Medicine are generally unique in their university settings in that faculty are almost always on “soft money.” That is, a faculty member's compensation is derived from her/his success in securing public (e.g., NIH) or private (e.g., foundation) grants or contracts, or on clinical revenues or gifts. For individual faculty, some portion of the compensation is paid for teaching (although this is more frequently an unfunded mandate) and, depending on his/her role, faculty may receive compensation for specific administrative roles. Each of these activities forms the basis for faculty “percent effort” and the total effort is used to guide total compensation – portions of which can be put “at risk” in incentive payments based on performance

There is considerable variation among medical schools in how compensation is constructed and how it is apportioned. Further, the sources may vary depending on whether the school is public or private and whether a teaching hospital is affixed to the medical school. It is clearly incumbent on faculty members to understand the “rules” and to recognize what they must do to assure they are able to support their position. Put simply, once a junior faculty member is beyond the recruitment and initial appointment phase (which may provide up to three years of “start up support”) future success will be guided by the nature of the appointment and the ability to support one's specific efforts. For example, if the appointment is primarily that of an investigator, faculty members will need to earn most of their compensation from grants. Conversely, if the largest percentage of one's time is spent on patient care, then one's individual clinical revenues will guide compensation. There is often a mixture of sources since most faculty are engaged

in multiple missions – but the proportion of effort often delineates the academic track and its related financial expectations.

The specifics of these tracks vary among institutions but there are some common principles. At Stanford, for example, there are four major tracks: University Tenure Line (UTL), which is applicable for faculty who spend 80% or more time as an “Investigator.” The Medical Center Line (MCL) track is for faculty who are engaged in research, scholarship and clinical care and thus function as “Clinician-Investigators and Clinician-Scholars.” The percentage of time in research/scholarship and patient care is individually determined, and it is important that this be clearly understood by the faculty member. In addition there are “Non-Tenure Line” appointments in Teaching and Research in which the focus is success in either of these two missions. Finally, at Stanford we have recently developed a “Clinician-Educator Line (CEL) for clinical faculty who spend the majority (80-90%) of their time in patient care and the remainder in scholarship, most often teaching.

From my perspective each of these faculty lines or tracks is important, and it is difficult to envision a successful academic medical center without all being present. Of course the proportionality of these tracks, just like the allocation of effort of individual faculty members, defines the nature of the medical center as “research intensive” or, at the other extreme, “primary care” oriented.

Choosing the right academic track and then gathering the resources to help ensure success will guide one’s individual success. One of the most important decisions a junior faculty member can make is confirming that the nature of the appointment matches one’s interests and passions and that the criteria and expectations for success are well understood. If research is one’s primary mission and passion, making sure that one has the research support and tools and also a path to assure they will continue (e.g., successful grant portfolio) is essential. If one loves patient care and teaching and is not attracted to research and written scholarship, it is far better to seek an appointment that matches these passions and to assure that the metrics that will be used to determine success and advancement are well understood. Thoughtful discussion with one’s division chief and department chair is essential at the outset and should occur on at least an annual basis.

It is also worth noting that one’s interests can change such that someone appointed to a clinical track may determine that he or she is better suited for full-time research and may wish to switch to an investigator track or vice versa. There are good reasons for doing this and, although not without difficulty, most academic centers will work to accommodate such career transitions. A less acceptable approach is for individuals to switch from one track to another (most often from a research to more clinical track) when they perceive that they will not be successful with an upcoming review. It is far better to anticipate a desired switch and prepare for that proactively and in coordination with one’s mentors than to seek to do so because perceived “failure” is imminent. All faculty should

become familiar with the specific guidelines relevant to their appointment. At Stanford these are delineated the “Faculty Handbook” which is accessible on-line at: <http://med.stanford.edu/academicaffairs/letters.html>.

Is tenure a myth or reality – what does it really mean in academic medicine?

Tenure is unique to universities and does exist, to varying degrees, at many academic centers. But it means something different in various schools and programs and thus it is important to understand what it conveys at one’s own institution. At its core, tenure means that one’s position is permanent absent highly unusual circumstances such as, for example, the closure of academic departments, severe financial exigency or dismissal for reasons of professional misconduct but it does not mean that one’s compensation or resources are assured over time. In fact in most major centers, if tenure is awarded, it really means that a base level of compensation is assured – although this is usually only a fraction of one’s overall compensation. Further, tenure does not guarantee a certain size laboratory or related resources since these are most often guided by performance and the financial support available for them.

Tenure track positions vary in their overall proportionality at major academic medical centers. At some, very few faculty are tenured even when they achieve full professorial status. At others, tenure is awarded after a specific time period of appointment (often 7-10 years) and at either the associate or full professor level. Because the institutional commitment is significant, tenure decisions are quite rigorous. Again, being knowledgeable about the criteria for tenure and the processes used to evaluate candidates for it is important. But it is also important to recognize that tenure decisions are challenging and that one can only strive to do the best work possible while recognizing that academic success, particularly in research, is not only guided by the nature of the questions being pursued but also by a certain amount of luck in being able to successfully answer them. This underscores the importance of mentoring and career guidance with regular reviews throughout the tenure evaluation process so as to permit the greatest degree of flexibility and highest level for success.

What about finding balance in work and personal life?

I will not mince words. Success in an academic career is demanding and time-consuming. While the levels of rigor and expectation vary among institutions and are highest in the most premier centers, a career path in academic medicine can be stressful. From my point of view the excitement of discovery, the ability to have an impact on a specific problem or to change the course of disease management, and the opportunity to teach students and train future generations of physicians or scientists outweigh the pressures that occur in academic medicine. But I fully recognize that this trade-off is very individually perceived and felt and is also influenced by many other life pressures and demands.

It is difficult to envision that a full-time appointment in academic medicine would require less than 60 hours per week of work. Clearly this degree of commitment

has a particularly strong impact during the early phase of one's career and is made more challenging by the fact that it often occurs during the same phase of life in which personal development, family relations, and financial pressures are also in the forefront. Thus, choosing one's career path, institution, work scope and support systems carefully is critical. Forging partnerships and sharing responsibilities – personally and professionally – can be extremely helpful.

Seeking flexibility is also important and certain positions (laboratory research versus patient care) can be more accommodating to different time schedules. Again, being proactive and open about one's needs and expectations is essential. It is also important to understand what resources are available to faculty to help support family life or work balance, which include child day care, elder care, counseling, and financial management.

I think it is also incredibly important to make careful lifestyle choices – not only to promote one's career but also to foster one's personal well-being. Being balanced is key – in nutrition, work schedule, sleep and exercise. The latter is particularly important, in my opinion, since a regular exercise program also fosters better lifestyle choices and further improves energy, stress relief and overall health.

One of the important changes now occurring in academic medicine is an increasing willingness of faculty at all levels to acknowledge the importance of work/family balance and to seek ways of achieving it. While words alone will not accomplish this task, a willingness to address this matter honestly – and without some of the judgmental attitudes of the past – is a very important source for future progress.

How to stay excited about one's career over time – what are the options?

I think one of the greatest attributes of a career in academic medicine is that it offers the opportunity for continued growth and development along multiple dimensions and time-lines. It also offers the prospect of changing one's focus depending on opportunity and interest – as long as one has acquired the requisite skills. Clearly the best way to stay excited about one's career is to choose a focus that fulfills one's passions – and that also allows for those passions to change over time.

Early in one's career it is more likely that focus on one mission (e.g., research or patient care) will dominate. But over time, with increased skill acquisition and experience, it becomes possible to take on new challenges. This keeps the fires of excitement burning and is one of the great things about academic medicine. You can often recreate yourself- often multiple times over.

It is also important to pace one's career. The rush to make a certain grade or achieve a certain position rapidly (say become a professor by 40) not only can create undue pressure but also tends to truncate the longevity of one's career and

the significance of the questions being pursued. It is important to remember that an academic career is measured over decades and that moving through the pathways too quickly is a route to burnout and dissatisfaction. Of course I understand that this response is highly individualized – which only underscores to me that each individual should follow a course and pace that is comfortable and meaningful and that is not driven by someone else's agenda.

As I have noted elsewhere in this discussion, it is also important to never become too bound to any one institution. There are always choices, but if you come to believe that you can only be successful or happy in one setting or location, you have likely traded your flexibility and options to become captive to someone else's plans for you.

A good measure of success is whether you feel satisfied and happy most of the time. Certainly a long view is needed because there are lots of ups and downs and sometimes the cycles can be measured in days or even hours. But if over the months to years you relish your progress and love the work you are doing, then you have clearly made the right choice. Perhaps most important is to reflect often and deeply on why you choose medicine and science –and how you can continue to grow and love that choice.

I recognize that the comments offered here are subjective and largely oriented to individuals pursuing clinical academic careers. But I hope everyone will find something useful in them. If you have questions or concerns about anything I have said, please let me know. Also please feel free to offer your suggestions or observations as well.

Training Future Physician Leaders to be Agents of Change

In the last issue of the Dean's Newsletter I commented on the Scholarly Concentrations in our New Stanford Curriculum for Medical Education. A primary goal of the New Curriculum is to develop future leaders in medicine and biomedical research. Of course, physicians can be leaders in many ways, through important discoveries and innovations, the delivery of cutting-edge patient care or by advocating improvements in health systems or in the health of communities. To meet this latter goal, Drs. Clarence Braddock, Associate Professor of Medicine, and Lisa Chamberlain, Clinical Instructor in Pediatrics, have created a year long *Practice of Medicine Project*, which is part of the *Practice of Medicine* course. Dr. Braddock serves as the Director of the *Practice of Medicine* course and Dr. Chamberlain is the Director of the Office of Community Health. At its core, this course and especially the *Practice of Medicine Project* provide first-year medical students with the opportunity to select a contemporary topic in health care that enables them to form a partnership with a relevant community to address ways of better understanding or improving health care.

The *Practice of Medicine* course provides training in basic clinical skills and education about the broad dimensions of medical practice. A core philosophy of this course is that a number of disciplines (e.g., ethics, public health, epidemiology, nutrition, behavioral

medicine) are to be included, each of which has an impact on the contemporary practice of clinical medicine. A goal of the *Practice of Medicine Project* is to provide all Stanford medical students with a concrete experience in being leaders and agents of change in health care.

The *Practice of Medicine* is taught over three consecutive quarters. In the fall quarter, students form small groups and select an area of interest to pursue for their project. Next, the groups conduct background research on the topic of interest and explore its public health, policy, and ethical dimensions. Once they've arrived at this informed position, the course directors connect the students with key leaders in the health care community, and through this collaboration each group develops a written proposal and an action plan in support of the proposal. In the spring, groups carry out their project plan and present a summary of their work in a poster session. Of these, two exceptional groups are selected to give an oral presentation of their project during the Department of Medicine Grand Rounds.

The specific projects completed in the first three years of this innovative program have ranged across a broad continuum of local, state, and national issues. For example, one student group developed a piece of legislation that was ultimately sponsored by California State Senator Simitian as part of his, "There Ought to be a Law" program. This legislation created a system for recycling unused prescription drugs from pharmacies and making them available to needy patients. In fact, based on this project, Senator Simitian introduced this program into legislation that was passed and signed into law by the governor. Another group of students is now working with local counties on writing regulations and policies to implement this program.

A recent group developed a proposal for the US Department of Health and Human Services to create a national registry for volunteer health care workers for natural disasters. Motivated by what they'd seen first hand as volunteers after Hurricane Katrina, this group created a framework to allow physicians, nurses, pharmacists, and other health care workers to volunteer and have their state licensure cross-referenced quickly, thereby drastically shortening the delay in getting these volunteers in positions where they could help. Their program is now being implemented by the DHHS with our students serving as consultants.

Other groups have worked with school districts to develop sounder nutrition policies, and other groups have developed organ donor education campaigns or organized fitness programs for elementary school children. These are but a few examples of the many projects that our students are doing, in which they are simultaneously having an impact on the health of communities now and gaining experience and skill that will enable them to continue to be effective agents of change over the course of their careers.

I applaud the efforts of our students and offer thanks to Drs. Braddock and Chamberlain along with other faculty and community mentors and advisors.

A Perspective on Evolution from Stanford Medicine

Much has appeared in the press this past year on evolution and intelligent design. In an effort to get the facts straight and to cast them in an historical and scientifically grounded context, the latest issue of *Stanford Medicine* has focused its Summer 2006 issue on this important topic. Many of you will receive the hard copy but if you wish to read the articles on line please to: <http://mednews.stanford.edu/stanmed/2006summer/>. This is another great edition of *Stanford Medicine* and I encourage you to read it carefully.

A Reminder About Bike Safety

In past Dean's Newsletters I have expressed my concern about bicycle safety on campus and beyond. I remain quite distressed to see the numbers of students and others riding bikes with no lights or reflectors and darting across on-coming traffic - even at night. I also continue to be concerned by the fact that so many individuals do not wear helmets – including some of our own students. It is easy to forget how quickly and significantly one's life can be changed by a bicycle injury. For example, I recently spoke at a national conference on a panel with a colleague who had a serious biking injury shortly thereafter and who recently told me that she “hopes to be able to ambulate on crutches by September.” About ten days ago I learned that the University Chief Financial Officer, Randy Livingston, had been admitted to Stanford Hospital with a broken femur and fractured hand following a recreational bike injury. Fortunately he was wearing a helmet (which of course I asked him about when I went to visit him). As a reminder of how serious his injury could have been (beyond what I have already described), Randy sent the following note: *“I finally got the nerve to look at my bike helmet this afternoon and found it was cracked in 7 different places. I think it truly saved me from a very serious head injury and possibly death. For anyone who occasionally rides without a helmet, I suggest you reread this message and think otherwise.”*

I know his recent accident certainly made a lasting impression on Randy. I hope his observation will also give everyone who is cycling (especially those foolishly doing so without a helmet – or night light) a pause and reality check.

Admitting a Serious Mistake

In the last issue of the Dean's Newsletter I referred to the seriously flawed and highly misleading and erroneous report in the *Stanford Daily* about discrimination at the medical school. It was journalism at its worst, and it prompted Drs. Hannah Valantine, David Stevenson and me to write a strong letter of protest to the Daily that I also printed in the last edition of the Dean's Newsletter (see: <http://deansnewsletter.stanford.edu/#4>). An equally distressed letter from Provost Etchemendy also appeared in the same issue of the *Stanford Daily*. Thanks to those communications and other discussions, the editor of the *Stanford Daily* elected to print a retraction. Although I found this episode highly objectionable, I do want to compliment editor Camille Ricketts and writer Ben Eppler for having the courage and wisdom to admit their error. Facile comments and unproved allegations can create enormous damage, and I believe damage was done by the original *Stanford Daily* article. That damage is partially ameliorated by the retraction that follows. Equally important, I hope this unfortunate experience provides a source of education for

all involved about how important it is to assure accuracy and scholarship in reporting news as facts – and not opinion. While the standard for journalism should always be high, one could credibly argue that it should be at its acme at an institution of Stanford University's caliber. Sadly that was not the case in this instance – but maybe there is hope for the future.

Here is the retraction – which did appear on the front page of the June 8th issue of the *Stanford Daily*.

Editor's Note: Med School story misleading

By Camille Ricketts & Ben Eppler

Editor-in-Chief,

Thursday, June 8, 2006

Dear Readers,

On May 25, The Daily ran an article titled "Med School faculty claim systematic discrimination." Since its publication, the story has drawn fire from administrators and faculty members. As those responsible for the article, we are taking this opportunity to clarify the issues it raised and to apologize for any misleading information it contained. We do this first and foremost for the benefit of our readers, and secondly, to give the University credit where credit is due.

When a newspaper runs such a high-profile story, it has the responsibility to carry the burden of proof. We were not able to present enough solid evidence to justify several of the stated allegations. While The Daily was shown documents sufficiently demonstrating discrimination and unfair hiring practices in a few isolated cases, this evidence is not necessarily enough to indicate a "systematic" problem.

More importantly, we saw no documented material backing up anonymous sources' suspicions that Stanford ties within the Bush administration prompted the U.S. Department of Labor to halt its discrimination investigation. The University has categorically denied this claim. In retrospect, we exercised poor news judgment in including this detail.

In addition, the number of documents showing that certain job openings are filled before they are advertised is too limited to support any broad claim. Our sources were constrained due to fear of being identified, but we should have required them to present more specific evidence or refer us to others willing to speak on the record.

Finally, we apologize for leaning so heavily on unnamed sources to an extent that prevented the University from starting a constructive dialogue with its accusers. In the future, The Daily should approach similar situations differently, making

sure that information provided by anonymous sources can be verified through other channels, and is not a matter of opinion.

Past lawsuits against the University alleging discrimination — several of which have been settled out of court, blocking plaintiffs from speaking to the press — are well covered in the media. The Department of Labor's investigation is currently underway, and it has yet to rule whether discrimination has occurred or not. Still, our handful of testimonies from former and present Medical School faculty members in no way proves that these problems are ongoing.

In fact, we have since spoken to other Medical School sources who say strong efforts are being made by the school's leadership to improve diversity and combat discrimination. Chief among these efforts is the creation of the Office of Diversity and Leadership within the school and the appointment of Hannah Valentine to oversee it as the senior associate dean.

Despite our errors in judgment, the article was based on experiences related to us by high-ranking members of the Medical School faculty. Perhaps our readers would have been better served by an article examining the merits of these few complaints. Regardless, this experience has offered many valuable lessons, and we hope to continue holding both The Daily and the University to a high standard.

Awards and Honors

Dr. William Dement, Lowell W. and Josephine Q. Berry Professor in the Department of Psychiatry and Behavioral Sciences and Professor, by courtesy, of Psychology, received an Honorary Doctor of Science degree from the Mount Sinai School of Medicine in recognition of his seminal work on sleep. Congratulations to Dr. Dement.

Dr. Richard Hoppe, the Henry S. Kaplan-Harry Lebeson Professor of Cancer Biology, has been named the 2006 recipient of the Gold Medal Award from the American Society of Therapeutic Radiology and Oncology (ASTRO). He will receive the Gold Medal at the annual ASTRO meeting in November 2006. Please join me in congratulating Dr. Hoppe.

Dr. Harley McAdams, Associate Professor of Developmental Biology, has just been elected as a Fellow of the American Academy of Microbiology (AAM). Members are elected based on their records of scientific achievement and original contributions that have advanced microbiology. Congratulations, Dr. McAdams.

Dr. Phil Sunshine, Emeritus Professor of Pediatrics in the Division of Neonatal and Developmental Medicine, is the recipient of the 2006 Silver and Gold Award given by the University of Colorado Medical Alumni Association. The award is

the highest recognition bestowed by the Association for professional achievement and community service. Congratulations, Dr. Sunshine.

Dr. Larry Zaroff, Senior Research Scholar at the Center for Biomedical Ethics has been chosen as the Associated Students of Stanford University (ASSU) Teacher of the Year. Dr. Zaroff teaches the core medical humanities course for the med school's Biomedical Ethics and Medical Humanities scholarly concentration. This award was created to recognize a single faculty member, nominated by students or other faculty members, who has gone above and beyond the duties of classroom instruction. Congratulations, Dr. Zaroff.

On Wednesday evening May 31st we had a celebratory reception to honor five new recipients of endowed chairs. The reception was held in the Cantor Art Museum and included friends and families of the five new chair holders. It was a wonderful acknowledgement of exceptional careers. The five new endowed professors are:

Dr. Michael F. Clarke, the Karel H. and Avice N. Beehuis Professor in Cancer Biology

Dr. Lawrence L.K. Leung, the Maureen Lyles D'Amborogio Professor in Medicine

Dr. William Maloney, the Elsbach-Richards Professor in Surgery

Dr. Norman Rizk, the Berthold and Belle N. Guggenhime Professor in Medicine

Dr. Linda M. Shortliffe, the Stanley McCormick Memorial Professor

Please join me in congratulating our new endowed professors.

Dora Castaneda, graduate student in the Department of Medicine, was selected to receive one of the five 2006 Herbert W. Nickens Medical Student Scholarships from the Association of American Medical Colleges and its Division of Diversity Policy and Programs. The award honors students who have made a significant contribution to diversity and demonstrate leadership. Congratulations, Dora.

Appointments and Promotions

- **Lavera Crawley** has been appointed to Assistant Professor (Research) of Pediatrics, effective 6/01/06.
- **Douglas Owens** has been promoted to Professor of Medicine, effective 6/01/06.

- **Eric Sibley** has been promoted to Associate Professor of Pediatrics, effective 6/01/06.

Dean's Newsletter

June 26, 2006

Moving Toward a Final Resolution of a Medical Center Policy on Stanford-Industry Interactions

During the past year we have had a number of helpful and occasionally provocative discussions about interactions of Stanford students, faculty and staff with industry. I certainly appreciate the value of appropriate and productive interactions with industry, and indeed I hope we can foster and nurture relationships that facilitate our mission in *Translating Discoveries*. However, I also recognize that some interactions with industry have become too intermingled and are now contaminated by gifts, financial gains and marketing tactics that can blur the boundary between academia and industry. I have addressed this important topic in prior Dean's Newsletters (http://deansnewsletter.stanford.edu/archive/07_25_05.html), and I have shared earlier, draft versions of a policy document aimed at addressing this issue (http://deansnewsletter.stanford.edu/archive/02_21_06.html) in order to engage you in a broader discussion.

During the past several months a Policy Working Group of representatives of the School and Hospitals, chaired by Dr. Harry Greenberg, Senior Associate Dean for Research, and staffed by Dr. Kathy Gillam, Senior Advisor to the Dean, have worked diligently with a broad group of faculty and staff throughout the Medical Center to refine the policy recommendations and guidelines. I would like to thank Drs. Greenberg and Gillam for their considerable efforts, willingness to listen to and engage all points of view and commitment to move this process to conclusion. Based on the work that has been accomplished, we distributed the draft recommendations to our Executive Committee three to four weeks ago in anticipation of a discussion of the penultimate document at our June 16th School of Medicine Executive Committee meeting. The current Stanford-Industry Interactions Policy consists of six elements:

1. Gifts and Compensation
2. Site Access by Sales and Marketing Representatives
3. Provision of Scholarships and Other Funds to Students and Trainees
4. Support for Educational and Other Professional Activities
5. Disclosure of Relationships with Industry
6. Training of Students, Trainees and Staff Regarding Potential Conflicts of Interest with Industry

At the Executive Committee meeting some of the key elements were highlighted and discussed, and the policy was unanimously supported. Since we now are moving to closure on this topic, I thought it would be appropriate to share our provisional conclusions with you in some of these key areas. It is important to note, however, that we

are awaiting final approval of these guidelines from the Medical Boards of Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. We anticipate that these reviews and, hopefully, approvals will occur in early July. Once that has been achieved we will be able to institute the policy across the Stanford Medical Center – likely by September 1, 2006.

Some of the key elements of the policy follow:

Gifts and Compensation

- Personal gifts (including small gifts like pens, etc.) cannot be accepted from industry on site – and acceptance of such gifts is strongly discouraged off-site as well (e.g., at professional meetings or events).
- Gifts or payments cannot be accepted for such activities as listening to a sales talk by an industry representative or changing a patient's prescription.
- Clinical care decisions must be separated from any perceived or actual benefits that might be accrued from industry.

Site Access by Sales and Marketing Representatives

- Once enacted the Stanford Policy will not permit sales and marketing representatives in any patient care area in the Stanford Medical Center except for in-service training by appointment only.
- In non-patient care areas (i.e., research buildings, auditorium, etc), marketing and sales representatives would only be permitted access by appointment, and normally only for such purposes as in-service training for research, clinical equipment or devices already purchased or the evaluation of new purchases of equipment, devices or related items.
- Access would also be permitted by invitation from the hospital pharmacy to obtain information about new drugs.

Provision of Scholarships and Other Funds to Students and Trainees

- Such support must be free of any actual or perceived conflict of interest and must comply with guidelines specified in the policy that will mitigate against these types of potential conflicts.

Support for Educational and Other Professional Activities

- Educational and professional activities must be in compliance with the Accreditation Council for Continuing Medical Education (ACCME) Standards for Commercial Support regardless of whether formal CME credit is being granted.
- **No** meals or other types of food or gifts that are directly funded by industry can be accepted.
- While the Stanford Policy does not apply to meetings outside of the Medical Center and University, it is incumbent on participants to understand whether the financial support by industry is fully disclosed by

the meeting sponsor and that the meeting or lecture content is determined by the speaker and not the industrial sponsor.

Disclosure of Relationships with Industry

- Stanford faculty, students or staff are prohibited from publishing articles under their own names that are “ghost-written” by industry employees.
- In their scholarly contributions, individuals must disclose their related financial interest in accordance with the International Committee of Medical Journal Editors (www.icmje.org).
- Those having a direct role in making institutional decisions on clinical equipment or drug procurement must disclose any financial interests they or their immediate family have in companies that might substantially benefit from the decision. They must also disclose any research or educational interest they or their department have that might substantially benefit from the decision.

Training of Students, Trainees and Staff Regarding Potential Conflicts of Interest with Industry

- All students, residents, trainees, and staff shall receive training regarding potential conflicts of interest in interactions with industry.

I want to thank the members of the Policy Working Group for their important efforts on moving this project forward. In addition to Drs. Harry Greenberg and Kathy Gillam, whom I mentioned earlier, other members include: Joshua Callman, Director of Continuing Medical Education; Mildred Cho, Associate Professor of Pediatrics; Gilbert Chu, Professor of Medicine; Barbara Flynn, Manager of the Conflict of Interest Review Program; Ann James, University Counsel; Shashank Joshi, Assistant Professor of Psychiatry and Behavioral Sciences; David Magnus, Associate Professor of Pediatrics and Director of the Center on Bioethics; Darla Mochly Rosen, Senior Associate Dean for Research; Julie Parsonnet, Senior Associate Dean for Medical Education; Geoff Rubin, Professor of Radiology; Christy Sandborg, Professor of Pediatrics; Sheetal Shah, Director of Risk Management Controls and Education; Larry Shuer, Chief of Staff at SHC; Kelly Skeff, Professor of Medicine; and Ian Tong, Chief Resident, Department of Medicine.

Commencement 2006 Was a Big Success

On Saturday, June 17th the University and School of Medicine held their commencement activities. Despite the hot weather, spirits were high and the mood ebullient. Following a luncheon, families and friends filled the large white tent on the Dean’s Lawn that provided both relief from the heat and a community of joy as graduates received their Master of Science, Doctor of Philosophy and/or Doctor of Medicine degrees. Following an invocation by Reverend Scotty McClennan, Dean for Religious Life, two graduating students addressed the audience: Iwei Yeh spoke on behalf of the PhD students and Jason Karamchandani spoke for the MD graduates. They both did an outstanding job. I also addressed the graduating class and then announced the faculty award recipients (see

below). For the 2005-2006 academic year, 36 Master of Science degrees were conferred along with 92 PhD degrees and 100 MD degrees.

Faculty Awards

In addition to congratulating our students for their accomplishments, commencement is also a time to honor faculty who have made significant contributions to their education. Accordingly, I am pleased to list the teaching awards that were announced at the School of Medicine Commencement.

The Arthur L. Bloomfield Award: In Recognition of Excellence in the Teaching of Clinical Medicine

- *Laura Bachrach*, Pediatrics
- *Erika Schillinger*, Family and Community Medicine

The Henry J. Kaiser Family Foundation Award: For Outstanding and Innovative Contributions to Medical Education

- *Peter Rudd*, Internal medicine

The Henry J. Kaiser Family Foundation Award: For Excellence in Preclinical Teaching

- *Laurence Baker*, Health Research and Policy
- *Lawrence Mathers*, Pediatrics
- *David B. Lewis*, Pediatrics
- *Robert Siegel*, Microbiology and Immunology

The Henry J. Kaiser Family Foundation Award: For Excellence in Clinical Teaching

- *Peter Pompei*, Medicine
- *Elizabeth Stuart*, Pediatrics
- *Elliott Wolfe*, Medicine

The Franklin G. Ebaugh, Jr. Award: For Advising Medical Students

- *Kuldev Singh*, Ophthalmology

The Alwin C. Rambar-James B.D. Mark Award: For Excellence in Patient Care

- *William E. Benitz*, Pediatrics

Stanford University School of Medicine Award: For Graduate Teaching

- *Arend Sidow*, Pathology and Genetics

Stanford University School of Medicine Award: For Outstanding Service to Graduate Students

- *William Weis*, Structural Biology

If you wish to view the 2006 Commencement celebration you can do so by viewing the streaming video at: <http://www.med.stanford.edu/commencement/>

Symposium on Autoimmunity in Digestive Health and Disease

On Friday, June 23, the Stanford Digestive Disease Center (DDC), held its Annual Center Symposium. The DDC is an NIH-funded center directed by Dr. Harry Greenberg, Senior Associate Dean for Research and Training and Joseph D. Grant Professor in the School of Medicine. Its purpose is to promote research relevant to digestive disease. The Center supports a variety of Cores at Stanford as well as an annual pilot grant program. Friday's Symposium was co-sponsored by the Stanford Institute for Immunity, Transplantation and Infection (ITI) and by the Center for Clinical Immunology at Stanford (CCIS). The meeting attracted over 100 attendees and consisted of eight sessions focused on various components of the immune response as it relates to the gastrointestinal tract and liver. Speakers included a number of invited experts as well as selected Stanford faculty, including Dr. Richard Blumberg (Harvard University), Dr. Mark Davis (Stanford University), Dr. Charles Elson III (Univ. of Alabama School of Medicine), Dr. Eric Gershwin (UC Davis), Dr. Martin Kagnoff (UC San Diego), Dr. Chaitan Khosla (Stanford University), Dr. Bill Robinson (Stanford University, 2006 Symposium Director), and Dr. Samuel Strober (Stanford University). I understand that all of the presentations were scientifically very exciting and worthwhile. Congratulations to Dr. Greenberg and his colleagues for a successful symposium.

Early Matriculation Program Commences

With commencement only days in the past, a group of 2006 Stanford Medical students began the Early Matriculation Program (EMP) on Wednesday, June 21st. As part of Stanford's Center of Excellence, the EMP is designed to increase the number of underrepresented minority and disadvantaged students who plan to pursue careers as leaders in academic and clinical medicine. The EMP provides new students with an introduction to each of the Scholarly Concentrations in the New Stanford Medicine Curriculum, and it will connect students with selected faculty with whom they can begin their activities in one of the Concentrations. The Program also will provide course work in histology and biochemistry, and students will participate in workshops presented by Stanford School of Medicine faculty that will examine careers in academic medicine.

I want to welcome our new EMP students, who will be joined in late August by the rest of the 2006 medical school class.

Update on Child Care at Stanford University

Because a number of very appropriate questions have been raised about child care services at Stanford, I asked Ellen Waxman, Director of Faculty Relations, to provide this update on our continuing efforts to address the concerns regarding child care options on campus and within the local community. Her report is summarized as follows.

Ellen reports that the University is in the planning stages to build a new child care center that is anticipated to open in 2008. This new center will offer priority enrollment to faculty and graduate students. More information will be forthcoming as plans develop. Here at the School of Medicine we have been exploring the feasibility of assisting faculty in finding alternate forms of care to the university's child care centers with special consideration to the flexibility, availability, and affordability of the child care.

This summer begins Year 2 of a joint School of Medicine-University pilot program to launch a Nanny and Nanny Share Referral Network. This is a new approach that uses nannies as well as other forms of home childcare. In the pilot phase, it is open to School of Medicine Faculty and University Graduate Students and Postdoctoral Fellows. The program was developed in collaboration with Teresa Rasco, Director of the Stanford Work Life Office, and is administered for Stanford by the Work Life Office. This Office has contracted with an external provider, Children's Creative Learning Center (CCLC), to provide background screening; referral services; and consultation, interview and employment forms to potential Stanford family employers of nanny services. (CCLC is familiar with Stanford because it also manages the Arboretum Child Care Center, and it will manage the new center to be built on campus).

The pilot program is testing the feasibility of creating a Stanford Nanny/Nanny Share Referral Network. CCLC refers nanny/nanny share candidates to families. Families interview the potential candidate and determine whether to offer the individual a position. The family is the employer of the childcare provider. CCLC also attempts to match families to share a nanny or to refer families to nannies who are available to work part-time. As a *new* service, beginning in July, CCLC will also offer, at no cost, background screenings of potential nanny candidates who were located by eligible Stanford families on their own.

If the pilot program is successful in building a Stanford Nanny/Nanny Share Referral Network, a long-term goal of the program is to test the feasibility of expanding a Stanford referral network to include Licensed Family Home Care Providers. Brochures and Information Materials will be available beginning next month to be followed by Information Sessions scheduled by the Work Life Office. For additional information, please contact, Carol Skladany in the Work Life Office at carols@stanford.edu or 723-2661.

Ellen ends her report by noting cautious optimism about the success of this program, and by again recognizing there is no single solution for issues regarding childcare. The pilot project is progressing to everyone's satisfaction at the end of its first year of operations. However, building a referral network from scratch is a time-consuming and difficult project. CCLC is challenged to locate appropriate nanny candidates (just as individual families are) and it is understandably challenging to recruit potential nannies without immediate prospects for job placement.

I want to express my appreciation not only to Ellen Waxman for her many efforts in this area but to Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs; Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership; and Dr. John Boothroyd, formerly Senior Associate Dean for Research, Graduate Affairs and Postdoctoral Affairs, who have been especially supportive of this program. Thanks also to Provost John Etchemendy for his support of graduate student participation in the pilot program.

I hope that this pilot program and other resources will help address the important challenge of childcare at the School of Medicine and throughout Stanford University. I look forward to hearing about further progress in this and other programs.

Supporting Academic Career Development.

In the last issue of the Dean's Newsletter I discussed some of the issues and challenges that can impact academic career development (see:

<http://deansnewsletter.stanford.edu/#3>), particularly for clinical faculty. Over the years we have tried to provide support for faculty development, and I am pleased to let you know that Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership, has informed me that her Office is sponsoring two workshops to provide faculty with career development information and skills. They are as follows:

- 1. Scientific Writing:** Taught by Michaela Kiernan, Ph.D., Senior Research Scientist at the Stanford Prevention Research Center, July 12, 4-6 p.m., Alway Building, Room M112. This workshop will focus on six practical techniques to improve clarity and conciseness across all sections of journal manuscripts and grants, when and how to use the techniques, and on improvement of writing skills for journals and grants.
- 2. Grant Writing:** Taught by Marilyn Winkleby, Ph.D., Associate Professor of Medicine at Stanford, July 20, 4-6 p.m., Alway Building, Room M112. This workshop will focus on different types of grants, the review process and scoring criteria, integrating scientific ideas into a clear, convincing 'story', and ideas for advocating one's expertise and ideas to funding agencies.

Drs. Kiernan and Winkleby have taught these workshops successfully at Stanford and other universities, and I encourage interested faculty to take advantage of this opportunity. Register by sending an email to bemiller@stanford.edu indicating which

workshop you wish to attend. Please be in touch with Barb Miller at 725-8402 with any questions about the workshops.

It's Not Just Trips

As you know, in response to requests from the Provost, the School of Medicine has been very active in implementing both education and programs aimed at reducing peak-hour traffic. I have previously reviewed some of the early "Phase I" actions on this topic in my April 17th Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/04_17_06.html#3).

The next phase in this effort, "Phase II," was outlined last week by Julia Tussing, Managing Director of Finance and Administration, at a meeting of department Directors of Finance and Administration and Trip Reduction Representatives (staff assigned to spearhead this effort within departments). The Phase II effort will involve a meeting of each staff member in the School with a Trip Reduction Representative, supervisor, or other leader to jointly develop a commuting and work plan that will satisfy the needs of the employee and the department and will at the same time contribute to the trip reduction effort. These meetings will be spread over the next two months, with completion scheduled by September 1.

It is important to emphasize that these individualized plans, as well as the other related activities of the Trip Reduction program, need to be accompanied by a cultural shift in the School of Medicine community towards openness to trying new ways of getting work done. As the Trip Reduction program has unfolded, it has become clear that it is related in dynamic and synergistic ways with other forward-looking and transformative efforts in the School. These include planning for the movement of different groups to off-site locations; efforts to be more environmentally aware in our work activities (Stanford's "carbon footprint"); discussion and implementation of work/life balance improvements; and focus on health issues. Among the many benefits of changing commuting habits and moving towards more flexible work plans are less pollution, lower stress, better health, higher productivity, and more effective technologies for a mobile work force.

It won't surprise you to know that I am a strong proponent of exercise as one way of improving health and well-being. For those able to commute by walking or bicycling, the changes catalyzed by the Trip Reduction program could be viewed as a help rather than hindrance. Indeed, a number of faculty and staff have commented on how much better they feel now that they are biking to work or walking from the Caltrain, for example. Of course I recognize that this is not feasible for all faculty and staff.

Thank you for your individual efforts to reduce the number of car trips you make to campus, especially during peak hours, and for your cooperation in developing an individual commuting and work plan or facilitating the efforts of staff in your areas to do so. I look forward to seeing the results of the Phase II Trip Reduction efforts over the coming months.

Future Events

Outdoor Science Talks at the Cantor

The Stanford Office for Science Outreach, the Cantor Center for Visual Arts, and Stanford Continuing Studies join together to invite you, your friends, and family (high school age and up) to campus this summer to experience the wonders of art and science. Come around 5:00 pm and wander through the acclaimed Cantor Museum, then buy dinner and/or drinks at the Museum's Cool Café, and join us at 7:00 pm on lawn chairs outside of Cantor for a fascinating glimpse into the world of scientific research.

On five Thursday evenings throughout the summer, Stanford will present lectures from its top researchers on subjects ranging from an environmental success story to the unraveling of mysteries of the human body, the earth, and ancient texts. The lectures will be delivered in lay terms that the general public can understand. Plenty of time will be made available for questions and answers following each talk. Both entrance to the Cantor Museum and the lecture series are free to the public. Several hundred people can be accommodated.

An organic buffet BBQ dinner will be available for purchase at the Cool Café in the Museum from 5:00 until 8:00 PM, with both meat and vegetarian options, along with wine, beer, soft drinks, desserts and coffee (cash only).

- Back to Life – The Rebirth of the Monterey Coast (An Environmental Success Story for a Change)
Stephen Palumbi – Professor of Biological Sciences
June 22
- Using Evolution to Understand Human Growth and Disease
Matthew Scott – Director of Bio X
July 6
- 100 Years after 1906: A Century of Progress in Understanding Earthquakes and Their Effects
Mark Zoback – Professor of Geophysics
Mary Lou Zoback – Senior Research Scientist with the USGS
July 20
- Archimedes: Ancient Text Revealed with X-ray Vision
Uwe Bergmann – Physicist, Stanford Linear Accelerator Center (SLAC)
August 3
- Human Embryonic Stem Cells: Science, Ethics, and Politics
Julie Baker – Assistant Professor, Genetics
Hank Greely – Professor of Law and Professor, by courtesy, of Genetics
(Dean Pizzo will be hosting)

Bio-X Symposium 2006: Regenerating Life,

SAVE THE DATE: November 10-11, 2006

<http://biox.stanford.edu>

Awards and Honors

Dr. Gary K. Schoolnik, Professor of Medicine and of Microbiology & Immunology, has been chosen by the Hewlett Award Committee as the 18th recipient of the Albion Walter Hewlett Award. The Hewlett Award was established by the School of Medicine in 1983 to honor "the physician of care and skill who is committed to discovering and using biologic knowledge, wisdom and compassion to return patients to productive lives."

Gerald M. Reaven, Emeritus Professor of Medicine, is the 2006 recipient of the Endocrine Society's highest award – the Fred Conrad Koch Award. This award is presented annually to recognize exceptional contributions for endocrinology and includes a \$25,000 honorarium.

David A. Stevens, Professor of Medicine (Infectious Diseases and Geographic Medicine) at the Santa Clara Valley Medical Center, has just been awarded the ISHAM Lucille Georg Award by the International Society for Human and Animal Mycology Council, in recognition of his outstanding scientific achievement in medical mycology. The award will be presented at the Congress in Paris this week.

Sharon Hunt, Professor of Medicine (Cardiovascular Medicine), has been selected to receive the 2006 Laennec Master Clinician Award from the Council on Clinical Cardiology, in recognition of her contributions and achievements in the field of clinical cardiology. The award will be presented at the American Heart Association Scientific Sessions held in Chicago in November.

Appointments and Promotions

- **Garry Gould** has been promoted to Associate Professor of Radiology, effective 6/01/06.
- **Paul Keall** has been appointed to Associate Professor of Radiation Oncology, effective 7/01/06.
- **Joseph Liao** has been appointed to Assistant Professor of Urology, effective 7/01/06.

Dean's Newsletter

July 2006

Getting the Facts on Conflicts of Interest

The July 9th and 10th issues of the *San Jose Mercury News* featured major stories on conflicts of interest focusing specifically on the Stanford University School of Medicine. I am confident that there were many reactions to these articles by members of our university community as well as by the public. Conflict of interest is an important topic that has many implications for both not-for-profit and for-profit organizations. While some of the issues surrounding conflict of interest are straightforward, others have many nuances that require more careful consideration and explication. To help make the facts as clear as possible, our Office of Communications and Public Affairs has posted an informative factual review of conflicts of interest as they relate to universities and academic medical centers. I would strongly encourage you to visit their website (see: <http://mednews.stanford.edu/conflict/>) and review the materials they have posted. Among the information provided is an informative Q&A section that addresses some key questions including:

1. *What are the highlights of the Stanford School of Medicine's conflict-of-interest disclosure policy?*
2. *Why is it important for a research institution like the School of Medicine to have policies that address conflict-of-interest issues?*
3. *Once a conflict of interest is disclosed, how is it handled? What determines whether a conflict is approved denied or managed?*
4. *When was the university's policy established?*
5. *Where do faculty members disclose this information? Is it available to the public?*
6. *Have you made any specific changes to the policy over the years?*
7. *What training on COI issues do faculty receive and how are revisions communicated?*
8. *Who sets and enforces the school's policy?*
9. *Is self-reporting effective?*
10. *How do you ensure faculty compliance?*
11. *What penalties are available should a member of the faculty not comply with the COI policy?*
12. *How many faculty members have been subject to these penalties?*
13. *How does the school handle a situation involving allegations of biased research due to COI?*
14. *Why not simply ban conflicts outright?*
15. *How does Stanford's policy compare to those of other academic medical centers?*

As you likely know, I have also written a number of commentaries on the topic of conflict of interest in previous **Dean's Newsletters**. I have listed a few of these articles below along with their URL in case you wish to refer to them.

1. ***Moving Toward a Final Resolution of Medical Center Policy on Stanford-Industry Interactions***, June 26, 2006 (<http://deansnewsletter.stanford.edu/#1>)
2. ***Shared Responsibility, Individual Integrity***, June 30, 2005 (http://deansnewsletter.stanford.edu/archive/06_30_05.html#1)
3. ***Conflict of Interest***, January 24, 2005 (http://deansnewsletter.stanford.edu/archive/01_24_05.html#1)
4. ***Evolving Issues Regarding Conflict of Interest***, February 22, 2005, (http://deansnewsletter.stanford.edu/archive/02_22_05.html#2)
5. ***NIH Blue Ribbon Panel on Conflict of Interest***, May 17, 2004 (http://deansnewsletter.stanford.edu/archive/05_17_04.html#3)

My own reactions to the Mercury News articles, which were written by reporter Paul Jacobs, is that he attempted to lay out a balanced analysis in the first of the two reports, although he seemed to convey a bias and sometimes did not understand the difference between consulting and conflict of interest. While he spent nearly 8 months interviewing various faculty and staff at Stanford, there were also some facts that he simply got confused about or never appreciated. Accordingly, I wrote an op-ed piece on his articles that appeared in the Friday June 14th issue of the *SJ Mercury News*, which I am taking the liberty of reprinting below:

Stanford manages its industry interactions with utmost integrity
By Philip A. Pizzo

San Jose Mercury News reporter Paul Jacobs' articles (July 9-10) explore the complex range of issues inherent in ties between academia and industry and make a notable contribution to the discussion of this important issue. Indeed, we have been quite engaged in continuously reviewing and modifying the relations of the Stanford School of Medicine with industry over the past several years, and I believe that this is a debate that the entire the academic medical community should welcome and fully engage in.

Among the significant questions to examine is: What would be the cost to the health of the American public if such ties between academia and industry were severed?

It should be noted that the federal government has explicitly promoted these ties since 1980, when Congress enacted the Bayh-Dole act, which authorized and encouraged universities to hold ownership of inventions made under federal funding. In fact this law mandates universities and private industry to work together to bring the fruits of university research to the public. This process has resulted in many medical innovations and advances that have improved the lives of millions of Americans.

There are now some 1,000 therapies and technologies that are based on university-licensed discoveries. Many of these advances are in the life-sciences products and processes for diagnosing disease, reducing pain and suffering and prolonging lives. They include the development of recombinant DNA technology (a joint Stanford-University of California-San Francisco discovery), as well as the nicotine patch, the PSA test for prostate cancer, and the cochlear implant, which provides a sense of sound to people who are deaf.

Of course, collaboration between university researchers and private companies carries with it the potential for conflicts of interest. The July 9 article describes one way Stanford addresses this: by requiring faculty members to disclose potential conflicts, regardless of the dollar amount of the financial interest.

But disclosure is far from the only strategy that the Stanford School of Medicine uses to protect the public's interest. When we identify a significant conflict, we take steps to eliminate, mitigate or manage it. These steps include modifying the research plan, disclosing the conflict to the public, disqualifying a faculty member from participating in all or a portion of a research project and in some cases requiring the faculty member to sever a relationship with industry.

As for the July 10 article, it is important to point out that Dr. Alan F. Schatzberg's research over the past 25 years has been consistently subject to rigorous peer review by scientific leaders at the National Institutes of Health and throughout the nation. His research findings have been published in highly respected peer-reviewed medical and scientific journals.

It is misleading to air criticism of his pilot studies for lack of statistical significance when, in fact, the studies were exploratory and not designed to show statistical significance in the first place. More important, and above all, through his research and care of patients, Dr. Schatzberg is a man devoted to alleviating the pain and suffering of those who face the challenge of the most severe and chronic forms of depression.

Finally, as the articles made clear, financial relationships between university medical researchers and industry require vigilant oversight. We will continue to do our utmost to manage Stanford School of Medicine's industry interactions with the highest integrity that is possible.

I recognize that we have continued work to do in this broad topic of conflict of interest and interactions with industry. In my last Newsletter (see: <http://deansnewsletter.stanford.edu/>), I detailed some of the forward-looking policy changes we are planning to implement in the area of industry interactions. We also need to continue our wide-ranging discussions with the dual goals of assuring that the highest quality research is performed at Stanford and that findings which can impact human

health are translated as rapidly as possible in tandem with doing all that we can to protect and enhance the public trust.

On Academic Medical Centers

On June 29th I participated in two events that permitted me to offer some reflections on academic medicine and medical centers. The first was the Campaign College, which included the University-wide development staff, where I participated in a panel with Martha Marsh, President and CEO of Stanford Hospital & Clinics, and Doug Stewart, Associate Vice President for Medical Development. The second event was a panel discussion on “Stanford in the Next Decade” for University senior managers, where I again participated in a panel, this time with Martin Shell, Vice President for Development, and Dr. Artie Bienenstock, Vice Provost and Dean of Research and Graduate Policy, Professor at SSRL and of Materials Science and Engineering and of Applied Physics. It struck me that many in our community do not understand what an academic medical center is or how it works to achieve its missions. That is not a surprise given the highly variegated organization and governance that defines academic medical centers – including Stanford University Medical Center. Accordingly, it seems reasonable to offer some comments and reflections on the comparative composition of academic medical centers and how Stanford is distinguished among them.

Academic medical centers are a product of the 20th century and have grown up in quite different manners and configurations in various cities and states. Since their inception, they have been characterized by different organization and governance structures (which not infrequently change at the same center) and with different areas of emphasis and expertise, albeit with some common denominators. At least at one level, all academic medical centers share a commitment to education, research and patient care. However, the adage that “if you have seen one academic medical center, you have seen one academic medical center” still rings true. This makes direct comparisons challenging and clearly impacts the experience of students, faculty and staff at various institutions.

From their beginnings, academic medical centers have included schools of medicine, one or more teaching hospitals, and physician (or faculty) practice plans. Among the 125 academic medical centers in the USA, the relationship among these three entities varies considerably. For example, most schools of medicine are affiliated with a parent university (as is the case with Stanford) but some medical schools (e.g., University of California at San Francisco, Baylor College of Medicine, University of Texas-Southwestern, Oregon University of the Health Sciences) are “free-standing,” with their sole mission being health sciences. Further, a number of medical schools are part of a larger health science complex that may include schools of public health, dentistry, nursing, or pharmacy, among others. In addition, some academic medical centers are physically connected to their parent university (as is the case for Stanford) whereas others are separated by miles (e.g., Harvard, Columbia, Johns Hopkins) or are even located across an entire state (e.g., Cornell-Weil College of Medicine).

Further, some medical schools appear to dominate the university in their size and, in some cases, prestige (e.g., Johns Hopkins, Washington University, University of Rochester) whereas others remain more balanced within the university, even to the point of established limits on faculty size to assure that the medical school doesn't become too dominant (e.g., Yale, Chicago – and of course Stanford). The character of medical schools and universities is further influenced by whether they are private or state funded and whether there are formal or informal mandates guiding their direction. For example, some medical schools are clearly organized and supported to train practicing physicians, with a special focus on assuring that graduates serve regional and state-wide interests (e.g., University of Washington, University of North Dakota) whereas others are more research focused and attempt to admit and train students who will pursue careers in research or academic medicine. Stanford falls into this latter category.

In addition to their organization, medical schools share a common goal in undergraduate medical education, although the number of students they admit and the types of students educated and trained vary widely. Most medical schools have a four-year curriculum generally comprised of two years of preclinical study and two years of clinical rotations. Indeed this has been the general configuration of medical education since Abraham Flexner's 1910 Report entitled *"Medical Education in the United States and Canada."* More recently a number of variations on this traditional theme have emerged, primarily in order to better organize the basic science curriculum into a more integrated systems-based approach (e.g., cardiovascular system, renal) and to introduce early into the curriculum problem-based learning and small-group discussions.

Stanford has always been unique, first by having a "five-year plan" when the School moved from San Francisco to the Stanford campus in 1959, which created flexibility and the opportunity for students to engage in research. This has been significantly refined and enhanced by the introduction of the New Stanford Curriculum in the Fall of 2003 that requires each student to choose a "Scholarly Concentration" designed to focus her or his energy in a specific analytic area that promotes scholarship and research (see: <http://med.stanford.edu/md/>). Furthermore, medical schools vary in whether they train only medical students or also offer advanced degrees in the biomedical sciences. Again, there is a broad range but Stanford is clearly at the far end, since we educate an equal number of PhD candidates and MD students. In addition, we are increasingly pursuing opportunities for students to pursue joint degree programs. Indeed, Stanford offers multiple opportunities for its MD students to become proficient in an area of basic science or some other important discipline (public policy, public health, economics, business, etc.) and for its PhD students to become more knowledgeable about clinical medicine (e.g., the recently introduced "Masters in Medicine" degree).

Similarly, medical schools vary widely in their focus on research as well as in the sources of their research support. The delineation used by *US News & World Reports (USNWR)* – about which I won't comment further in this discussion - divides schools into "research-intensive" or "primary care." Stanford clearly falls into the research-intensive category because of the focus of our faculty, the amount of total NIH funding and the amount of competitive funding per faculty member (for which we rank at the top). A strong research

focus is not inconsistent with excellence in patient care – which I believe our faculty does in an outstanding manner – but is related to the fact that most of our faculty have some (or all) of their time dedicated to research. Clearly this has an impact on the students we educate and on our goal of training leaders and individuals who will pursue careers as physician-scientists and clinician-scholars.

Teaching hospitals are the second key component of an academic medical center. These include ambulatory services (which are increasingly the focus of clinical care) as well as hospital-based facilities. In many cases the teaching hospital includes all services (including pediatrics) whereas in some institutions there are separate, sometimes freestanding children's hospitals (e.g., Children's Hospital of Philadelphia, Cincinnati Children's Hospital) or "women and children's hospitals." Specialty hospitals (e.g. for heart disease, orthopedics, neuroscience) have also emerged in recent years but are not part of the mainstream at this point. For a number of academic medical centers the major teaching hospital affiliates are owned by the university, even when they operate somewhat autonomously. In other settings, the hospital is independently owned and an affiliation agreement defines the relationship between the school and the hospital (e.g., Yale-New Haven Hospital is such an example). Further, while some academic medical centers are "closed facilities" (i.e., only faculty have admitting privileges), in many institutions the university hospital also functions as a community hospital.

At a different end of the spectrum, the Harvard teaching hospitals are unique as a model since the major affiliates (e.g., the MGH, Brigham, Children's Hospital, Beth Israel-Deaconess, Dana Farber Cancer Center) operate autonomously, employ their faculty, manage all grants, and have an affiliation with Harvard Medical School – even though the vast majority of the 8000 full-time faculty with Harvard Medical School appointments are in one of the affiliated hospitals. This is not a model that is likely to be replicated elsewhere but it does speak to the fact that academic medical centers have evolved in very different ways depending on whether teaching hospitals preceded the creation of the medical school or vice versa.

The model at Stanford shares similarities and differences with national peers. Stanford Hospital & Clinics and the Lucile Packard Children's Hospital are owned by the University, but they operate independently under the leadership of a President and CEO, who reports to a Board of Directors. At Stanford, the hospital boards include a mixture of Stanford University trustees and non-university trustee members. However all directors require approval by the University Board of Trustees. Like a number of its peers, SHC serves as a teaching hospital (80% or more of the patients who are admitted are under the care of faculty) as well as a community hospital, serving physicians who meet hospital credentialing. We value the involvement of community physicians to our medical center community. Although LPCH admits a smaller percentage and number of cases (given the nature of pediatric practice), it also serves the needs of community pediatricians as well as Stanford faculty. Again this is a valued partnership. The School of Medicine has an affiliation agreement with SHC and LPCH that is approved by the University Trustees.

The third element of an academic medical center, and of course in my opinion the most important, is the faculty. While a medical school includes basic and clinical science faculty, the major interactions in an academic medical center are between the school, teaching hospital(s) and the clinical faculty. These interactions are usually organized through a faculty or physician “practice plan.” The practice plan may be separately incorporated as a “foundation” (as is the case with many of the Harvard teaching hospitals) or integrated into the teaching hospital, or it may come under the jurisdiction of the Office of the Dean. Again, there are many different models and iterations.

At Stanford, all faculty are School of Medicine and University employees. That is, their official employment is with the university, they are accountable to the school leadership, all grants flow through the school, research and academic space is provided by the school, and compensation is recommended to the dean by the department chairs contingent on the approval of the Provost. However, the “clinics” where faculty practice are under the hospital’s aegis, and important activities such as physician billing, collections and professional payments flow through the hospital. Professional revenues and support for other faculty activities (e.g., medical direction, program support) are transferred from the hospital to the school through a process called “funds flow” – a topic I have addressed in previous Dean’s Newsletters (see: http://deansnewsletter.stanford.edu/archive/02_22_05.html).

Depending on the center, interrelations between the school, hospital and physician practice group can be a productive and effective or contentious and challenging. To a great extent this depends on two dominant factors: whether the missions between these three important entities are aligned and whether the leadership is able to work collaboratively and effectively. There is no question that teaching hospitals, medical schools and clinical faculty should share common goals – but the degrees of emphasis and focus will vary from center to center and will delineate the overall effectiveness of the functional affiliation. At the same time, it is important to acknowledge that there are cultural and monetary differences in the way universities and businesses (including hospitals) behave and these will not uncommonly lead to differences of opinion as well as tensions – which can be constructive and sometimes destructive. To address this complexity, a number of academic medical centers have appointed a single leader to coordinate the major elements (school, hospital and practice plan) and to also arbitrate disputes that may arise. The most common such position is that of a Vice President (or Vice Chancellor or Provost) for Medical Affairs.

Stanford has had such a model in the past but during the past 5 years (the length of time I have been Dean) a different model has been used. Specifically, we have recognized that to optimize each of the entities (both hospitals and the school), the respective leaders (Dean and CEOs) would need to function collaboratively. We have in fact done so (for the most part) by sharing a common vision, strategic plan and a willingness to address difficult issues as they arise in a manner that puts Stanford Medical Center first. While many governance structures are designed to address functional leadership, at the end of the day it is the ability of institutional leaders to work cooperatively that will define institutional success. I am pleased that the SHC CEO Martha Marsh and the LPCH CEO

Chris Dawes share those values and that, accordingly, our academic medical center has functioned in a collaborative and integrated manner.

While there are many examples of why it is important for the components of an academic medical center to work in a collaborative and coordinated manner, a meeting of the Association of Academic Health Centers on June 27-28 provides an excellent one. At that meeting, leaders from the university, school and hospital presented a work-in-progress effort designed to re-engineer the infrastructure needed to support clinical research and, in this case, clinical trial billing. Many academic medical centers across the country are grappling with the difficulties of creating a seamless interface between medical school, hospital and clinical faculty – a process that is confounded by a lack of unity regarding mission as well as a lack of integration between school, faculty and hospital. I am very pleased to say that our Stanford team presented how this can be done – and were clearly the envy of the attendees at this national meeting. Put simply, this was because a committee of senior faculty, representatives from the Dean’s Office, senior hospital vice presidents, and legal counsel has met for some two years to develop the SPCTRM (Stanford Packard Center for Translational Research in Medicine) program. This is a terrific example of how cooperation can solve a problem that would be simply insurmountable for any single component of an academic medical center. I want to thank in particular Dr. Steve Alexander, Professor of Pediatrics and Director of SPCTRM; Nick Gaich, Chief Operating Officer of SPCTRM; Dr. Harry Greenberg, Senior Associate Dean for Research; David Harray, Vice President, SHC; and Ann James, Office of the General Counsel.

Academic medical centers will surely continue to evolve during the years and decades ahead. Likely there will be continued internal reorganizations, driven by program developments or requirements. External factors, particularly the status of the health care system, will also have a major impact on the size, complexity and functions of academic medical centers. Given predictable change, it is important that academic medical centers continuously re-examine their mission and resources. At Stanford, our unifying mission remains “*Translating Discoveries*,” while fully realizing our success will require focus, communication, commitment and collaboration. Future success is our only option.

Health and Healthcare

My professional career has been dedicated to treating serious disease – both as an investigator and as a physician. As Dean I have also been very concerned about the healthcare system in this country – or the lack thereof. At the same time, in my personal life I have focused a lot of personal energy on health and the prevention of disease. As some of you know I have been a strong proponent of exercise, weight control and diet as key components to controlling personal risk – whether acquired or inherited. And while we all recognize that serious disease can strike regardless of one’s commitment to health, it is also a safe assumption that personal lifestyle and choice can have a big impact on reducing the likelihood of a host of human disorders.

Ironically, as one surveys the major diseases impacting human health, nearly all are the interaction of single or complex genetic traits with the environment and personal lifestyle choices. While there are some disorders we can simply not attenuate or prevent, many others will respond to lifestyle change. This is graphically illustrated by the epidemic of obesity that is sweeping the USA and many parts of the world and that carries enormous co-morbidity that can impact the health and longevity of generations to come. It is estimated that obesity has doubled in children 6-11 years of age and tripled in 12-19 year olds since the late 1970s. Much of this increase results from dietary choices largely associated with the marketing and availability of high carbohydrate, fat and calorie drinks and foods. In fact nearly 30 % of the calories consumed by children are from sweets and soft drinks and overweight children may consume as many as 1200-2000 calories per day from soft drinks alone. Fast foods and high volume sodas are particularly noteworthy. And this is big business, as evidenced by the many hundreds of millions of dollars spent on advertisements to children for various high caloric foods! This has prompted some physicians and public health officials to question whether legal action focusing on schools, the community and medical insurance is necessary to control this obesity.

A Health Policy Report in the June 15th issue of the *New England Journal of Medicine* (Volume 354:2601-2608) entitled “*Obesity – The Frontier of Public Health Law*” by Mello, MM, Studdert, DM and Brennan, TA address this important issue. In many ways this situation is analogous to the debate that took place over smoking during the past several decades. While there are many understandable concerns about regulating lifestyle, there can be no question that individual choices have tremendous societal and economic impacts as well as significant personal consequences.. The factors governing obesity in children, adolescents and adults are but one example.

The purpose of this brief commentary is simply to underscore the importance of pursuing personal health. It is all too easy to let simple interventions like exercise and diet, for example, be compromised or ignored. All that said, I do feel compelled to confess to those who may have seen me with my arm in a sling and a notably bruised face that I did have an injury during an early morning run on July 11th when I missed a curb and went crashing to the ground. So, I also acknowledge that exercise can be associated with injury as well (as I have learned many times in my own athletic career), but I would still maintain that the benefits far outweigh the risks. Indeed attention to simple health interventions can go a long way to promoting one’s well being and to reducing the need for healthcare (injuries aside). Certainly this is an issue that deserves everyone’s consideration and hopefully personal implementation.

USNWR Ranks Hospitals

On July 7th US News & World Reports (USNWR) published their annual ranking of “Best Hospitals” in the USA. Too much attention is given to these rankings but I do confess that I have been personally somewhat obsessed by the methodological deficiencies in some of these rankings, particularly schools of medicine, that favor size over quality. While Stanford School of Medicine was ranked # 7 in the nation in the April reporting on graduate schools, this scoring is impacted significantly by the total amount

of NIH support – in which Stanford can never truly lead given its small size compared to peer schools (see http://deansnewsletter.stanford.edu/archive/04_03_06.html#2). But that is an issue for another day.

Hospital rankings are also impacted by size, available services and reputation among other factors. In the new ranking Stanford Hospital & Clinics as well as the Lucile Packard Children's Hospital were separately ranked as #13. Of course we think they should both be higher, but given the small size of SHC and the relative youth of LPCH compared to peers, these rankings are quite admirable. Congratulations to both SHC and LPCH.

Dr. Ben Barres Offers an Important Perspective on Behalf of Women in Science

As a number of you likely know by now, Dr. Ben Barres, Professor of Neurobiology and of Developmental Biology and of Neurology and Neurological Sciences, wrote an informative and compelling commentary in the latest issue of *Nature* 442, 133-136(13 July 2006). I want to complement Dr. Barres for his personal courage in writing this important article and for his steadfast advocacy on important issues. Change only occurs when individuals speak up and lend their voice and reputation to important issues. Dr. Barres has done just that and I am proud of his efforts and of his work as a faculty member at Stanford. Because I also believe that Dr. Barres' perspective is so important I have his permission to print his commentary in this Newsletter in case you missed the original publication. Here it is:

Does gender matter?

Ben A. Barres

When I was 14 years old, I had an unusually talented math teacher. One day after school, I excitedly pointed him out to my mother. To my amazement, she looked at him with shock and said with disgust: "You never told me that he was black." I looked over at my teacher and, for the first time, realized that he was an African-American. I had somehow never noticed his skin colour before, only his spectacular teaching ability. I would like to think that my parents' sincere efforts to teach me prejudice were unsuccessful. I don't know why this lesson takes for some and not for others. But now that I am 51, as a female-to-male transgendered person, I still wonder about it, particularly when I hear male gym teachers telling young boys "not to be like girls" in that same derogatory tone.

Hypothesis testing

Last year, Harvard University president Larry Summers suggested that differences in innate aptitude rather than discrimination were more likely to be to blame for the failure of women to advance in scientific careers¹. Harvard professor Steven Pinker then put forth a similar argument in an online debate², and an almost identical view was elaborated in a 2006 essay by Peter Lawrence entitled 'Men, Women and Ghosts in Science'³. Whereas Summers prefaced his statements by saying he was trying to be provocative, Lawrence did not. Whereas Summers

talked about "different availability of aptitude at the high end," Lawrence talked about average aptitudes differing. Lawrence argued that, even in a utopian world free of bias, women would still be under-represented in science because they are innately different from men.

Lawrence draws from the work of Simon Baron-Cohen⁴ in arguing that males are 'on average' biologically predisposed to systematize, to analyze and to be more forgetful of others, whereas females are 'on average' innately designed to empathize, to communicate and to care for others. He further argues that men are innately better equipped to aggressively compete in the 'vicious struggle to survive' in science. Similarly, Harvard professor Harvey Mansfield states in his new book, *Manliness*⁵, that women don't like to compete, are risk adverse, less abstract and too emotional.

I will refer to this view - that women are not advancing because of innate inability rather than because of bias or other factors - as the Larry Summers Hypothesis. It is a view that seems to have resonated widely with male, but not female, scientists. Here, I will argue that available scientific data do not provide credible support for the hypothesis but instead support an alternative one: that women are not advancing because of discrimination. You might call this the 'Stephen Jay Gould Hypothesis.' I have no desire to make men into villains (as Henry Kissinger once said, "Nobody will ever win the battle of the sexes; there's just too much fraternizing with the enemy"). As to who the practitioners of this bias are, I will be pointing my finger at women as much as men. I am certain that all the proponents of the Larry Summers Hypothesis are well-meaning and fair-minded people, who agree that treatment of individuals should be based on merit rather than on race, gender or religion stereotypes.

The sums don't add up

Like many women and minorities, however, I am suspicious when those who are at an advantage proclaim that a disadvantaged group of people is innately less able. Historically, claims that disadvantaged groups are innately inferior have been based on junk science and intolerance⁶. Despite powerful social factors that discourage women from studying math and science from a very young age⁷, there is little evidence that gender differences in math abilities exist, are innate or are even relevant to the lack of advancement of women in science⁸. A study of nearly 20,000 math scores of children aged 4 to 18, for instance, found little difference between the genders (Fig. 1)⁹, and, despite all the social forces that hold women back from an early age, one-third of the winners of the elite Putnam Math Competition last year were women. Moreover, differences in test-test results are not correlated with the gender divide between those who choose to leave science¹⁰. I will explain why I believe that the Larry Summers Hypothesis amounts to nothing more than blaming the victim, why it is so harmful to women, and what can and should be done to help women advance in science.

If innate intellectual abilities are not to blame for women's slow advance in science careers, then what is? The foremost factor, I believe, is the societal assumption that women are innately less able than men. Many studies, summarized in Virginia Valian's excellent book *Why So Slow?*¹¹, have demonstrated a substantial degree of bias against women - more than is sufficient to block women's advancement in many professions. Here are a few examples of bias from my own life as a young woman. As an undergrad at the Massachusetts Institute of Technology (MIT), I was the only person in a large class of nearly all men to solve a hard math problem, only to be told by the professor that my boyfriend must have solved it for me. I was not given any credit. I am still disappointed about the prestigious fellowship competition I later lost to a male contemporary when I was a PhD student, even though the Harvard dean who had read both applications assured me that my application was much stronger (I had published six high-impact papers whereas my male competitor had published only one). Shortly after I changed sex, a faculty member was heard to say "Ben Barres gave a great seminar today, but then his work is much better than his sister's."

Anecdotes, however, are not data, which is why gender-blinding studies are so important¹¹. These studies reveal that in many selection processes, the bar is unconsciously raised so high for women and minority candidates that few emerge as winners. For instance, one study found that women applying for a research grant needed to be 2.5 times more productive than men in order to be considered equally competent (Fig. 2)¹². Even for women lucky enough to obtain an academic job, gender biases can influence the relative resources allocated to faculty, as Nancy Hopkins discovered when she and a senior faculty committee studied this problem at MIT. The data were so convincing that MIT president Charles Vest publicly admitted that discrimination was responsible. For talented women, academia is all too often not a meritocracy.

In denial

Despite these studies, very few men or women are willing to admit that discrimination is a serious problem in science. How is that possible? Valian suggests that we all have a strong desire to believe that the world is fair¹¹. Remarkably, women are as likely as men to deny the existence of gender-based bias¹³. Accomplished women who manage to make it to the top may 'pull up the ladder behind them', perversely believing that if other women are less successful, then one's own success seems even greater. Another explanation is a phenomenon known as 'denial of personal disadvantage', in which women compare their advancement with other women rather than with men¹¹.

My own denial of the situation persisted until last year, when, at the age of 50, several events opened my eyes to the barriers that women and minorities still face in academia. In addition to the Summers speech, the National Institutes of Health (NIH) began the most prestigious competition they have ever run, the Pioneer Award, but with a nomination process that favoured male applicants¹⁴. To their credit, in response to concerns that 60 of 64 judges and all 9 winners were men,

the NIH has revamped their Pioneer Award selection process to make it fairer. I hope that the Howard Hughes Medical Institute (HHMI) will address similar problems with their investigator competitions. When it comes to bias, it seems that the desire to believe in a meritocracy is so powerful that until a person has experienced sufficient career-harming bias themselves they simply do not believe it exists.

My main purpose in writing this commentary is that I would like female students to feel that they will have equal opportunity in their scientific careers. Until intolerance is addressed, women will continue to advance only slowly. Of course, this feeling is also deeply personal to me (see 'Personal experiences'). The comments of Summers, Mansfield, Pinker and Lawrence about women's lesser innate abilities are all wrongful and personal attacks on my character and capabilities, as well as on my colleagues' and students' abilities and self esteem. I will certainly not sit around silently and endure them.

Mansfield and others claim that women are more emotional than men. There is absolutely no science to support this contention. On the contrary, it is men that commit the most violent crimes in anger - for example, 25 times more murders than women. The only hysteria that exceeded MIT professor Nancy Hopkins' (well-founded) outrage after Larry Summers' comments was the shockingly vicious news coverage by male reporters and commentators. Hopkins also received hundreds of hateful and even pornographic messages, nearly all from men, that were all highly emotional.

Taboo or untrue?

There is no scientific support, either, for the contention that women are innately less competitive (although I believe powerful curiosity and the drive to create sustain most scientists far more than the love of competition). However, many girls are discouraged from sports for fear of being labeled tomboys. A 2002 study did find a gender gap in competitiveness in financial tournaments, but the authors suggested that this was due to differences in self-confidence rather than ability¹⁵. Indeed, again and again, self-confidence has been pointed to as a factor influencing why women 'choose' to leave science and engineering programmes. When women are repeatedly told they are less good, their self-confidence falls and their ambitions dim¹⁶. This is why Valian has concluded that simply raising expectations for women in science may be the single most important factor in helping them make it to the top¹¹.

Steven Pinker has responded to critics of the Larry Summers Hypothesis by suggesting that they are angry because they feel the idea that women are innately inferior is so dangerous that it is sinful even to think about it¹⁷. Harvard Law School professor Alan Dershowitz sympathizes so strongly with this view that he plans to teach a course next year called 'Taboo'. At Harvard we must have veritas; all ideas are fair game. I completely agree. I welcome any future studies that will

provide a better understanding of why women and minorities are not advancing at the expected rate in science and so many other professions.

But it is not the idea alone that has sparked anger. Disadvantaged people are wondering why privileged people are brushing the truth under the carpet. If a famous scientist or a president of a prestigious university is going to pronounce in public that women are likely to be innately inferior, would it be too much to ask that they be aware of the relevant data? It would seem that just as the bar goes way up for women applicants in academic selection processes, it goes way down when men are evaluating the evidence for why women are not advancing in science. That is why women are angry. It is incumbent upon those proclaiming gender differences in abilities to rigorously address whether suspected differences are real before suggesting that a whole group of people is innately wired to fail.

What happens at Harvard and other universities serves as a model for many other institutions, so it would be good to get it right. To anyone who is upset at the thought that free speech is not fully protected on university campuses, I would like to ask, as did third-year Harvard Law student Tammy Pettinato: what is the difference between a faculty member calling their African-American students lazy and one pronouncing that women are innately inferior? Some have suggested that those who are angry at Larry Summers' comments should simply fight words with more words (hence this essay). In my view, when faculty tell their students that they are innately inferior based on race, religion, gender or sexual orientation, they are crossing a line that should not be crossed - the line that divides free speech from verbal violence - and it should not be tolerated at Harvard or anywhere else. In a culture where women's abilities are not respected, women cannot effectively learn, advance, lead or participate in society in a fulfilling way.

Take action

Although I have argued that the Larry Summers Hypothesis is incorrect and harmful, the academic community is one of the most tolerant around. But, as tolerant as academics are, we are still human beings influenced by our culture. Comments by Summers and others have made it clear that discrimination remains an under-recognized problem that is far from solved. The progress of science increasingly depends on the global community, but only 10% of the world's population is male and caucasian. To paraphrase Martin Luther King, a first-class scientific enterprise cannot be built upon a foundation of second-class citizens. If women and minorities are to achieve their full potential, all of us need to be far more proactive. So what can be done?

First, enhance leadership diversity in academic and scientific institutions. Diversity provides a substantially broader point of view, with more sensitivity and respect for different perspectives, which is invaluable to any organization. More female leadership is vital in lessening the hostile working environment that young women scientists often encounter. In addition to women and under-represented minority groups, we must not forget Asians and lesbian, gay, bisexual and

transgendered folks. There are enough outstanding scientific leaders in these racial and gender groups that anyone with a will to achieve a diverse leadership in their organization could easily attain it.

Second, the importance of diverse faculty role models cannot be overstated. There is much talk about equal opportunity, but, in practice, serious attention still needs to be directed at how to run fair job searches. Open searches often seem to be bypassed entirely for top leadership positions, just when it matters most - search committees should not always be chaired by men and the committee itself should be highly diverse^{14,18}. Implementation of special hiring strategies and strong deans willing to push department chairs to recruit top women scientists are especially effective. It is crucial in the promotion process that merit be decided by the quality, not quantity, of papers published.

Women faculty, in particular, need help from their institutions in balancing career and family responsibilities. In an increasingly competitive environment, women with children must be able to compete for funding and thrive. Why can't young faculty have the option of using their tuition benefits, in which some universities pay part of the college tuition fees for the children of faculty, for day care instead? Tuition benefits will be of no help if female scientists don't make tenure. And institutions that have the financial capability, such as HHMI, could help by making more career-transition fellowships available for talented women scientists.

Speak out

Third, there should be less silence in the face of discrimination. Academic leadership has a particular responsibility to speak out, but we all share this responsibility. It takes minimal effort to send a brief message to the relevant authority when you note a lack of diversity in an organization or an act of discrimination. I don't know why more women don't speak out about sexism at their institutions, but I do know that they are often reluctant, even when they have the security of a tenured faculty position. Nancy Hopkins is an admirable role model, and it is time that others share the burden. It doesn't only have to be women that support women. I was deeply touched by the eloquent words of Greg Petsko¹⁹ following Summers' comments. And it has been 30 years since I was a medical student, but I still recall with gratitude the young male student who immediately complained to a professor who had shown a slide of a nude pin-up in his anatomy lecture.

Fourth, enhance fairness in competitive selection processes. Because of evaluation bias, women and minorities are at a profound disadvantage in such competitive selection unless the processes are properly designed^{11,12,14,18}. As the revamped NIH Pioneer Award demonstrates, a few small changes can make a significant difference in outcome. By simply changing the procedure so that anyone can self-nominate and by ensuring a highly diverse selection committee,

the number of women and minority winners went up to more than 50% from zero. This lesson can and should now be applied to other similar processes for scientific awards, grants and faculty positions. Alas, too many selection committees still show a striking lack of diversity - with typically greater than 90% white males. When selection processes are run fairly, reverse discrimination is not needed to attain a fair outcome.

Confidence booster

Finally, we can teach young scientists how to survive in a prejudiced world. Self-confidence is crucial in advancing and enjoying a research career. From an early age, girls receive messages that they are not good enough to do science subjects or will be less liked if they are good at them. The messages come from many sources, including parents, friends, fellow students and, alas, teachers. When teachers have lower expectations of them, students do less well. But we are all at fault for sending these messages and for remaining silent when we encounter them. Teachers need to provide much more encouragement to young people, regardless of sex, at all stages of training. Occasional words of encouragement can have enormous effects.

All students, male and female, would benefit from training in how to be more skillful presenters, to exert a presence at meetings by asking questions, to make connections with faculty members who may help them to obtain grants and a job, and to have the leadership skills necessary to survive and advance in academia. Because women and minorities tend to be less confident in these areas, their mentors in particular need to encourage them to be more proactive. I vividly recall my PhD supervisor coming with me to the talks of famous scientists and forcing me to introduce myself and to ask them questions. There is a great deal of hallway mentoring that goes on for young men that I am not sure many women and minorities receive (I wish that someone had mentioned to me when I was younger that life, even in science, is a popularity contest - a message that Larry Summers might have found helpful as well). It is incumbent on all of us who are senior faculty to keep a look out for highly talented young people, including women and minority students, and help them in whatever way possible with their careers.

Preparations for the CTSA

On Friday morning, July 14th, Dr. Harry Greenberg, Senior Associate Dean for Research, convened a planning retreat of the program leaders for Stanford's Clinical and Translational Award application that will be submitted in January 2007. As noted on the NIH website, "the **Clinical and Translational Science Awards (CTSAs)** program...will create a definable academic home for the discipline of clinical and translational science. Specifically, this program will encourage the development of novel methods and approaches to clinical and translational research, enhance informatics and technology resources, and improve training and mentoring to ensure that new investigators can navigate the increasingly complex research system. To create this "home," the program allows for local flexibility so that each institution can determine whether to establish a center, department, or institute in clinical and translational science."

Dr. Greenberg underscored that the goals of the CTSA are to educate, innovate and implement. This includes: 1) developing a cadre of well-trained multi- and inter-disciplinary investigators and research teams; 2) creating an incubator for innovative research tools and information technologies; and 3) synergizing multi-disciplinary and interdisciplinary clinical and translational research and researchers to catalyze the application of new knowledge and techniques to clinical practice at the front lines of patient care.

While the timeline for producing the final grant is short, we have actually been working on the fundamental components for this type of effort during the past 5 years as we have implemented our Strategic Plan, *Translating Discoveries*. Indeed, the transformational changes we have made in education and training through the *New Stanford Curriculum*, which focuses on educating future physician scholars and investigators and which offers Scholarly Concentrations in clinical and translational research, offer a firm underpinning for our CTSA application. Coupled with this are our related education programs for graduate students in clinical and translational research and medicine (i.e., the Masters in Medicine Program) and evolving programs that will enable clinical fellows to pursue

graduate training en route to becoming physician-scientists (i.e., the Advanced Residency Training at Stanford [ARTS] program). Moreover, the fundamental underpinning provided by BioX to foster innovative interdisciplinary research together with the broad interdisciplinary efforts of our five Stanford Institutes of Medicine and the Strategic Centers has already created unique opportunities for clinical and translational research.

To further enhance these efforts, programs like SPCTRM and STRIDE (Stanford Translational Research Integrated Data Environment) are being designed to provide the fundamental supports to foster clinical research along with data management, analysis, etc. Thus, in a number of ways, the new CTSA opportunity comes at a time when Stanford has already made a number of important transformational changes to enhance clinical and translational education and research. It provides an opportunity to further consolidate and refine the many new programs we have already put into place. That said, we also recognize that such large and overarching grant applications necessitate a tremendous amount of work and effort from many faculty and staff, many of whom are already extremely busy. In addition, given the current funding climate at the NIH, these applications are high risk. Despite our many accomplishments, we must perform at the very highest level if we hope to be approved and funded. It is imperative that those participating in the CTSA do the very best job they can and, because of its broad implications, that as many faculty and staff throughout the school as possible be engaged – and that there be opportunities for specifically interested faculty to participate.

Like all such grants, there are specific components that must be addressed. The goal of the July 14th retreat was to have each of the specific program leaders give an update of their planning efforts. Each area is in some way specified by the RFA (Request for Application), and each working group already has multiple faculty who are becoming engaged in the planning process. The 10 major programs areas and working groups for the CTSA grant are as follows:

Program Area	Working Group Leaders
<i>Research, Education, Training and Career Development</i>	Charles Prober* , Sam Gambhir, Mike Longaker
<i>Clinical Informatics</i>	Henry Lowe , Phil Lavori
<i>Trial Design and Biostatistics</i>	Phil Lavori
<i>Regulatory Knowledge and Support</i>	Steve Alexander , Corry Dekker, Ann Arvin
<i>Participant and Clinical Interaction Resources</i>	Brandy Sikic , David Stevenson
<i>Development of Novel Clinical and Translational Methodologies and Pilot and Collaborative Translational and Clinical Studies</i>	Alan Krensky , Daria Mochly-Rosen
<i>Clinical and Translational Technologies and Resources (Cores)</i>	Daria Mochly-Rosen , Alan Krensky
<i>Clinical Research Ethics</i>	David Magnus , Mildred Cho

<i>Community Engagement</i>	Steve Fortmann , Doug Owens
<i>Evaluation: Getting to Quality</i>	Peter Rudd , Kevin Tabb, Joe Hopkins

* Denotes the Working Group Chair

Dr. Greenberg will be serving as the Principal Investigator for the CTSA, and he will be joined by three Co-PIs: Drs. Charles Prober, Phil Lavori and Brandy Sikic. If you have any questions, concerns or interests, please feel free to contact any of these individuals or any of the working group leaders noted above. While there is a tremendous amount to do in the next several months, we are building from an excellent and already transformational base and I feel confident that a great proposal will result. But everyone's help and support will be needed to make this a reality.

Summer Schedule

As has been my practice in past years, the Dean's Newsletter will not be published on the usual bi-weekly schedule in July and August. However, should important events arise between issues I will make sure you are aware of them. In addition, at the end of July through the third week of August I will be on a "mini-sabbatical" that will include some vacation time but also some time to work on a new book. Rest assured - I promise not to report on either of these topics in my subsequent Dean's Newsletters! The bi-weekly publication schedule will resume in September.

Awards and Honors

- **Dr. Marlene Rabinovitch**, Dwight and Vera Dunlevie Professor in Pediatric Cardiology and, by courtesy, of Developmental Biology, has recently learned that she has been selected to be a 2006 Distinguished Scientist by the American Heart Association. Congratulations to Dr. Rabinovitch.

Appointments and Promotions

- **Vinod Bhutani** has been appointed to Professor of Pediatrics (Neonatology) at the Lucile Packard Children's Hospital, effective 7/01/06.
- **Lee-may Chen** has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology effective 9/1/06.
- **Stephen Fischer** has been reappointed to Associate Professor of Anesthesia, effective 7/01/06.
- **Hayley Gans** has been appointed to Assistant Professor of Pediatrics (Infectious Diseases) at the Lucile Packard Children's Hospital, effective 7/01/06.
- **Joseph Helms** has been promoted to Adjunct Clinical Professor of Anesthesia effective 9/1/06.

- ***Paula Jacobsen***, has been promoted to Adjunct Clinical Professor of Psychiatry and Behavioral Sciences effective 9/1/06.
- ***Joel Killen*** has been reappointed to Associate Professor of Professor (Research) of Medicine, effective 7/01/06.
- ***Jason Lee*** has been appointed to Assistant Professor of Surgery at the Veterans Affairs Palo Alto Health Care System, effective 7/01/06.
- ***Peter Lee*** has been promoted to Associate Professor of Medicine (Hematology), effective 7/01/06.
- ***Alan Maloney*** has been promoted to Adjunct Clinical Associate Professor of Psychiatry and Behavioral Sciences effective 9/1/06.
- ***Mali Mann*** has been promoted to Adjunct Clinical Associate Professor of Psychiatry and Behavioral Sciences effective 9/1/06.
- ***Kerry Mitchell*** has been promoted to Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences effective 9/1/06.
- ***Beverley Newman*** has been promoted to Associate Professor of Radiology, effective 7/01/06.
- ***James Newman*** has been promoted to Adjunct Clinical Assistant Professor of Otolaryngology-Head and Neck Surgery effective 9/1/06.
- ***Scott Oesterling*** has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology effective 9/1/06.
- ***Chandra Ramamoorthy*** has been promoted to Professor of Anesthesia, effective 7/01/06.
- ***John Ruark*** has been promoted to Adjunct Clinical Associate Professor of Psychiatry and Behavioral Sciences effective 9/1/06.

Dean's Newsletter

August 21, 2006

Dr. Ralph I. Horwitz is Appointed Chair of Medicine

I am extremely pleased to announce today the appointment of Dr. Ralph I. Horwitz as the next Chair of the Department of Medicine at Stanford. He will officially join Stanford on December 1st. Dr. Horwitz is currently Dean of the Case Western Reserve University

School of Medicine as well as Vice President for Medical Affairs and Director of the Case Research Institute. He has been at CWRU since 2003, where he is also Professor of Medicine. Prior to that Dr. Horwitz was the Harold H. Hines, Jr. Professor of Medicine and Epidemiology and Chair of the Department of Medicine at Yale University – a position he held from 1994-2003.

Dr. Horwitz has had a long and distinguished career as a clinician-scientist and leader in academic medicine. Following his graduation from Pennsylvania State University College of Medicine in 1973, he served as an intern and resident at McGill University and the Royal Victoria Hospital as well as at the Massachusetts General Hospital and at Yale, where he was in the Robert Wood Johnson Clinical Scholars Program – which he subsequently co-directed.

Dr. Horwitz has had a very prominent career as a clinical investigator focusing on population science and outcomes research. He is the author or co-author of over 180 peer-reviewed publications addressing a range of topics, with a particular focus on stroke and its neurological sequelae, cardiovascular medicine, cancer, and clinical trial methodology. In addition to his many publications in high impact journals, his work has been recognized by election to the American Society of Clinical Investigation, the American College of Epidemiology, the American College of Physicians, the American Board of Internal Medicine, and the Association of American Physicians (where he is on track to become President). He is also a member of the Institute of Medicine of the National Academy of Sciences. Dr. Horwitz is the recipient of numerous awards and honors and has held a number of national leadership positions.

The selection of Dr. Horwitz resulted from a national search that commenced in March 2005 with a Committee co-chaired by Drs. Harvey Cohen, Arline and Pete Harman Professor and Chair of the Department of Pediatrics, and Gary Glazer, Emma Pfeiffer Merner Professor and Chair of the Department of Radiology. The Search Committee included Drs. Mark Davis, Scott Delp, Carlos Esquivel, Michael Jacobs, Larry Leung, Michael Longaker, Beverly Mitchell, Bill Mobley, Daria Mochly-Rosen, Michael Peterson, Robert Robbins, Alan Schatberg, Matt Scott, Lucy Shapiro, Irv Weissman, and medical student John DeCaro.

As part of the search process the Co-Chairs and Committee identified 125 possible candidates based on discussions with national leaders as well as extensive department and school-wide interviews. The position was broadly advertised with specific reach out to ELAM (Executive Leadership in Academic Medicine) to help identify potential women candidates. After careful consideration, 11 individuals were invited to campus for 2-day visits during which they each met with dozens of individuals. I met with each of the candidates during their visit to Stanford, as did Martha Marsh, the CEO of Stanford Hospital and Clinics. The 11 candidates who visited with us represented diverse interests and included three women and three minority candidates.

I met with the Search Committee at the end of March 2006 and received their final comments and recommendations – including their list of four unranked finalists. I then

contacted the finalists individually and personally conducted extensive reference interviews with individuals familiar with their work and contributions. Based on that I conducted selected visits to the candidates' home institutions, where I met with additional individuals. At the conclusion of that process it seemed clear to me that Dr. Horwitz possesses the experience, vision, commitment and excellence to assume this important role. Thankfully Dr. Horwitz felt similarly about Stanford, permitting us to move forward with his appointment.

I want to thank the Chairs and the Committee for their diligent work in defining a broad list of candidates and in recommending a short list of four finalists for my consideration. I also want to thank Rebecca Trumbull and Kendra Baldwin for their outstanding efforts in coordinating and facilitating the process and candidate visits. I heard from all the candidates who visited how appreciative and impressed they were by the way they had been treated during their visits to Stanford.

While I am extremely pleased about Dr. Horwitz' appointment, I want to also recognize the exceptional and diligent work that has been done by Drs. Harry Greenberg and Norm Rizk in their roles as interim co-chairs. They began their assignment in January 2005 and have provided wonderful leadership. Unlike many interim leaders, Drs. Greenberg and Rizk have been proactive in addressing the challenges and needs of the department, including the recruitment of a number of important faculty. The morale and excellence of the department improved further under their guidance and I am confident that this helped to make the position of chair attractive and exciting to our candidates. So in addition to sharing my excitement for Dr. Horwitz' recruitment, please join me in thanking Drs. Greenberg and Rizk for their leadership.

Hospital Boards Approve the Stanford Industry Policy

In the June 26, 2006 Dean's Newsletter

(http://deansnewsletter.stanford.edu/archive/06_26_06.html), I provided an update on the status of our Stanford policy on interactions with industry. In that report I indicated that the School of Medicine's Executive Committee had unanimously endorsed the policy at its June 16th meeting. I am now very pleased to add that the Medical Boards and Boards of Directors of Stanford Hospital & Clinics and of the Lucile Packard Children's Hospital have also approved the policy. This is outstanding news, since it permits us to have a unified Medical Center wide policy. The new policy will go into effect on October 1st. Further details about the policy itself and how it will be implemented will be forthcoming in mid-September. Many individuals have worked diligently to shepherd this policy through the necessary committees in the School and Hospitals and I am deeply appreciative to each of them. I want to acknowledge in particular Kathy Gillam, Senior Advisor to the Dean, for the essential role she has played in this process to date.

Hospitals Collaborate with the School of Medicine to Facilitate Clinical Research

Rising hospital costs related to the generally high costs of hospital services and supplies in the Bay Area have frequently been a problem for Stanford clinical researchers. I am

pleased to report that SPCTRM (Stanford/Packard Center for Translational Research in Medicine), Stanford Hospital & Clinics (SHC), and the Lucile Packard Children's Hospital (LPCH) have developed, after a process lasting almost two years, a new clinical research discount structure covering the three major categories of clinical care costs in clinical research studies. These are laboratory services, ancillary procedural services, and supplies. The new discounts are:

Laboratory:	Discounted at hospital "outreach pricing"
Ancillary procedural services:	Discounted at current NIH rates
Supplies:	Discounted at acquisition cost plus a small administrative fee.

The new laboratory and supplies discounts are already being applied to all study budgets prepared by SPCTRM/RMG (Research Management Group), with the ancillary procedural services discounts set to come on line on September 1, 2006.

The new discounts are intended to promote clinical research opportunities more effectively by making studies done at Stanford facilities more competitive financially. Moreover, the new discounts are simply the first pass at a discount structure based on a "cost neutral" principle. SHC and LPCH, demonstrating their commitment to clinical and translational research, have pledged to provide services and supplies to clinical researchers essentially at a level that is cost neutral to the hospitals. This commitment represents a substantive change and will certainly help our efforts in clinical and translational research—including our planned application for a (Clinical and Translational Science Award) (CTSA) award to the NIH this next January.

To ensure that this principle is maintained, the discounts will be revisited and recalculated on an annual basis. This productive and collaborative effort uniting School of Medicine clinical researchers with their primary clinical facilities is emblematic of the transformation of the clinical and translational research enterprise currently underway at Stanford. Much of this activity is in preparation for the establishment in late 2007 of the Stanford Center for Clinical and Translational Education and Research (SCCTER). We anticipate that this new center will be part of the major NIH CTSA initiative to overhaul the way clinical research is supported in academic medical centers across the country.

I would like to acknowledge Martha Marsh, President and CEO of SHC, Mike Peterson, COO of SHC, Chris Dawes, President and CEO of LPCH, Sue Flanagan, COO of LPCH, and Gary May, VP of Managed Care Contracting of SHC/LPCH, for their work and continued efforts to develop a more simplified and competitive pricing structure. In addition I want to thank Nick Gaich and Dr. Steve Alexander from SPCTRM as well as Dr. Harry Greenberg for their efforts in helping to bring these important changes to fruition.

Making Connections and Forging Collaborations: Use the CAP

In recent surveys of faculty, one of the major areas of expressed concern was how to identify potential Stanford scientific collaborators for research projects. As it turns out, there is a system already in place that will enable you to do just that. Known as the Community Academic Profiles (CAP), this directory provides an easy-to-use interface through which people - both inside and outside of the Stanford community - can learn about research taking place across the School of Medicine (see <http://med.stanford.edu/profiles/>). Currently there are approximately 1460 profiles available in CAP, a number of which have been completed and updated to reflect faculty interests, publications, and more. If you haven't reviewed or updated your own CAP profile I would strongly encourage you to do so. There is no question that these profiles are being accessed.

According to Henry Lowe, Senior Associate Dean for Information Resources and Technology, whose team developed CAP, there are approximately 120,000 profile views per month, and many faculty have more than 200 viewings. Interestingly, while 20% of the traffic is from within Stanford, nearly 50% is from sites across the USA as well as from international sites, most notably in the UK, Spain, Italy, China, Israel, Singapore and Japan. This makes it all the more important to make sure that your faculty profile is current – and also to recognize how much this service can help you when you are initiating new projects or seeking advice about current ones. CAP is also a great source for finding relevant journal articles by our faculty. Currently there are some 36,400 visible publications with approximately 400 new publications being imported into faculty CVs every two weeks.

I would strongly encourage you to visit CAP and to use it. Clearly our colleagues around the world are doing so!

Spirit Award 2006 Announcement

I have received the following announcement from Cori Bossenberry, Director of Human Resources. I urge you to participate in this year's nomination process.

The School of Medicine's annual Employee of the Year, Spirit Award Program will take place over the next few months. Staff are an important part of our community and contribute greatly in support of our missions. This annual award provides an opportunity for departments to acknowledge those contributions. Dr. Pizzo will award each of the two selected staff members with a \$1,000 cash prize and an "A" parking sticker or the monetary equivalent for a bicycle for the coming year at the School's Annual Staff Recognition Banquet on November 9th.

This week, departments will receive program ballots and brochures. Please distribute these to your students, staff and faculty. For convenience this year, the brochure and a ballot are also available from the new Spirit Award website: <http://med.stanford.edu/SPIRIT>.

Any faculty, staff, student, fellow and post doc working at the School of Medicine may

nominate any eligible staff members (bargaining unit workers are not eligible) in any department or administrative area. To be eligible, staff members must have been employed as regular employees, at 50% FTE or more, in one department/unit for the past two years.

Selection criteria: To be selected, staff must consistently demonstrate the following traits: customer service, positive attitude, initiative, dedication and motivation.

Forwarding Nominations:

All ballots must be received by the Dean's Office Human Resources Group by September 21, 2006. Ballots may be sent electronically to Chris Maci at cmaci@Stanford.edu, or via hard copy to: Employee of the Year, Spirit Award Selection Committee, c/o Human Resources Group, Medical School Office Building, Mail Code 5460.

All those who submit a completed nomination ballot will be entered into a drawing to receive a \$25 gift certificate to the Stanford Shopping Center. Late ballots will not be accepted. Recipients will be selected and notified in mid-to late October and will be invited to attend the Dean's Recognition Program on November 9th.

We are excited to be bringing this award forward again this year and hope you will use this opportunity to nominate deserving employees. Thank you for your participation!

Awards and Honors

Eliza Farmer Chakravarty, MS, MD, Assistant Professor, Immunology & Rheumatology, has been named the first Dr. Elaine Lambert Fellow in Lupus Research and Treatment in the Center for Clinical Immunology at Stanford (CCIS). The Fellowship, created by the John and Marcia Goldman Foundation, is the most recent in a series of gifts from a generous family that helped launch CCIS 11 years ago. Dr. Lambert, who was honored by the Goldmans for her exceptional work as a care giver, is a former Stanford faculty member and colleague of C. Garrison Fathman, MD, Founder and Director of CCIS. Congratulations, Dr. Chakravarty.

Karl Deisseroth, M.D., Assistant Professor of Bioengineering and of Psychiatry and Behavioral Sciences, has just won the Presidential Early Career Awards for Scientists and Engineers, established in 1996. This major award represents the highest honor that any young scientists or engineer can receive in the United States. Congratulations, Dr. Deisseroth.

Richard Hoppe, M.D., the Henry S. Kaplan-Harry Lebeson Professor of Cancer Biology, will receive the 2006 Gold Medal from the American Society for the Therapeutic Radiology and Oncology (ASTRO) in November. Congratulations, Dr. Hoppe.

The Medical School's **Office of Community Health** has just received the third annual Partnership Award from Community Health Partnership for its commitment to improving

the health and wellness of our community. "This organization is making an impact on primary health-care issues," said Lourie Campos, director of policy at CHP. "Our partnership has been one of the highlights of the year."

Community Health Partnership is a nonprofit consortium of community health clinics for underserved populations in San Mateo and Santa Clara counties. CHP and the Office of Community Health teamed up to develop coursework and to plan curriculum relating to public health issues for Stanford medical students.

"This is just about the highest honor we can receive," said Ann Banchoff, program director of the Office of Community Health. "This entity didn't exist a year ago. Being recognized shows we're being responsive to the community."

Upcoming Events

Outdoor Science Talks at the Cantor:

Human Embryonic Stem Cells: Science, Ethics, and Politics

7 pm, Thursday, August 31

Cantor Art Museum Lawn

The Stanford Office for Science Outreach, the Cantor Center for Visual Arts, and Stanford Continuing Studies join together to invite you, your friends, and family to campus this summer to experience the wonders of art and science. Come around 5:00 pm and wander through the acclaimed Cantor Museum, then buy dinner and/or drinks at the Museum's Cool Café and join us at 7:00 pm on lawn chairs outside of Cantor for a fascinating glimpse into the world of scientific research. The lectures will be delivered in lay terms that the general public can understand. Plenty of time will be made available for questions and answers following each talk. Both entrance to the Cantor Museum and the lecture series are free to the public. An organic buffet BBQ dinner will be available for purchase at the Cool Café in the Museum from 5:00 until 8:00 PM, with both meat and vegetarian options, along with wine, beer, soft drinks, desserts and coffee (cash only).

The upcoming science talk, hosted by Dean Phil Pizzo, will focus on "Human Embryonic Stem Cells: Science, Ethics, and Politics." Human embryonic stem cells are among the most promising, most complicated, and most controversial areas of contemporary biomedical research. Professor Julie Baker's lab is working to create and understand human embryonic stem cells; she will describe the scientific challenges of this work and the medical and scientific reasons these challenges are worthwhile. Professor Hank Greely serves on Stanford and California committees that are working to ensure stem cell research proceeds ethically. He will discuss the difficult issues that need to be resolved, not just about what kind of research should be done but how that research should be done-and the political complications these issues raise.

Appointments and Promotions

Bruce A. Arnow has been promoted to Professor of Psychiatry and Behavioral Sciences, effective 8/1/06.

Janice Brown has been promoted to Associate Professor of Medicine (Bone Marrow Transplantation), effective 8/1/06.

John Chan has been reappointed to Assistant Professor of Obstetrics and Gynecology, effective 7/1/06.

Sanjeev Dutta has been appointed to Assistant Professor of Surgery and Pediatrics at the Lucile Packard Children's Hospital, effective 6/1/2006.

Dominik Fleischmann has been promoted to Associate Professor of Radiology, effective 8/1/06.

Nicholas Giori has been reappointed to Assistant Professor of Orthopaedic Surgery at the Veterans Affairs Palo Alto Health Care System, effective 8/1/06.

Antonio Hardan has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 8/1/2006.

Robert Christopher Hayward, has been promoted to Professor of Psychiatry and Behavioral Sciences, effective 8/1/06.

Douglas Levinson has been appointed to Professor of Psychiatry and Behavioral Sciences, effective 8/01/06.

Sam Most has been appointed to Associate Professor of Otolaryngology - Head & Neck Surgery, effective 8/1/2006.

Craig Rosen has been reappointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Veterans Affairs Palo Alto Health Care System, effective 7/1/06.

Nancy Schulman has been appointed to Assistant Professor of Medicine (Infectious Diseases & Geographic Medicine) at the Veterans Affairs Palo Alto Health Care System, effective 8/1/2006.

Erich Schwartz has been appointed to Assistant Professor of Pathology at the Veterans Affairs Palo Alto Health Care System, effective 8/1/2006.

Dean's Newsletter

September 11, 2006

A Day for Reflection

September 11, 2001. For each of us who lived through that day, emotions and harsh memories are seared into our very beings. Inexplicable human suffering is hard to reconcile with human evolution. Our personal feelings and reactions have not really been forgotten, but anniversaries have a way of resurfacing those deeply held feelings and emotional reactions. Without question the media and those with access to public airways will seek to remind us of that fateful day on this fifth anniversary of 9/11, often with different agendas and purposes. As a physician I recognize that looking backward sometimes provides an opportunity to heal old wounds. But it also can revitalize feelings and emotions in less productive ways – calling on fear to shape the present rather than seeking more creating solutions that can better guide the future.

At our current stage of human evolution, it is hard for most of us to understand the tool of terrorism, although we all respond to its impact. We know that evil is not new to the world and that it has taken many forms and shapes over the course of millennia and in the histories of many past civilizations. At the same time, we can appreciate that, today, as a global community we are all aware of the great disparities and distinctions that can yield to conflagration when accompanied by intolerance and an unwillingness to communicate, understand or share. Ironically, even though we are more and more a global community we are people and nations of vastly different beliefs that are deeply rooted but not well understood or mutually appreciated. Moreover, our great cultural, economic, and religious divides are not likely to be breached or healed by simple rhetoric, stereotypic images or an unwillingness to communicate.

There is little question that our world is dramatically different today than it was five years ago. And in my opinion there is little doubt that the United States is perceived and reacted to differently around the world than it was prior to September 11, 2001. The choices that have been made by this and other nations and their leaders have widened gaps of understanding and torn people and families apart. While human evolution might be thought to have a forward trajectory, one might argue that we have lapsed into more primitive and less enlightened stages of reason – with serious consequences for individuals, nations and the world.

My hope is that we will use this 9/11 to recognize that we are in a state of world illness that needs more thoughtful and refined diagnoses and that we should be thinking about treatments and reparations that promote healing rather than further disease. I am particularly alarmed by the likely remedies that certain world leaders have prescribed - and will no doubt continue to prescribe – which I fear will further aggravate rather than ameliorate our situation as a people, nation and global community.

On this day I will reflect on where we are today in America and in the world. But as a physician I will be asking myself what it will take to promote healing rather than more

suffering. One opportunity will come in November of this year when we can choose leaders who seek to be healers and who will pursue different remedies and not simply rely on rhetoric, stereotyping or violence to address a serious – even life-threatening – global illness.

Stanford Industry Interactions Policy Announcement

As many of you know, during the past year we have had a number of discussions about interactions of Stanford students, faculty and staff with industry. I certainly appreciate the value of appropriate and productive interactions with industry, and indeed I hope we can foster and nurture relationships that facilitate our mission in

Translating Discoveries. However, I also recognize that some interactions with industry have become too intermingled and are now contaminated by gifts, financial gains and marketing tactics that can blur the boundary between academia and industry. I have felt for some time that we needed a Stanford Medical-Center-wide policy to provide guidance in this area.

I am pleased to announce today that we now have such a policy. The Stanford Industry Interactions Policy, which will become effective on October 1, 2006, governs interactions, largely in the clinical and educational arenas, with the pharmaceutical, biotech, medical device, and hospital and research equipment and supplies industries. (Research interactions are governed by a separate policy). The policy will apply to the School of Medicine, the Stanford Hospital and Clinics, and the Lucile Packard Children's Hospital, as well as to other clinics operated by the hospitals.

The Web site at <http://med.stanford.edu/coi/siip/> contains the policy as well as further information and resources for applying it. I encourage you to become familiar with its contents, especially the sections that apply directly to your areas of responsibility.

Thank you for your attention to this important new policy.

Members of Incoming 2006 Class Are Already Full-Fledged Medical Students

Our incoming class of MD students began their orientation to the School of Medicine on Monday, August 28th and officially began classes on Thursday August 31st. By now they are certainly fully-fledged medical students!

The incoming class of 2006 includes 86 students, who were accepted from an applicant pool of 5999. The Admissions Committee, led by Dr. Gabe Garcia, selected 410 students for interviews (350 MD applicants and 60 MSTP applicants) and ultimately admitted 184 candidates, 11 of whom have deferred admission – generally because of a special fellowship award.

The 2006 MD class includes 48 (56%) women, 22 (26%) New Americans, and 15 (17%) students who are “under-represented in Medicine.” As with past classes, a number of students enter with advanced degrees already in hand (i.e., 9 students hold MS degrees and 7 have [or soon will have] PhD degrees).

While more students received their undergraduate degree at Stanford or Harvard than other individual colleges or universities, our incoming class is quite diversified, with some 36 colleges sending one or more students to Stanford. These students had birthplaces on any of four continents or in any of 25 states (including the District of Columbia).

This year's medical school class is also joined, for the first time, by six Masters in Medicine students. These are individuals who are pursuing a PhD at Stanford and who wish to learn more about clinical medicine, with the goal of advancing research in translational and clinical research. The Masters in Medicine program was initiated by Professor Ben Barres and is still in its inaugural phase. As it evolves it will help bridge important connections between basic and clinical scientists – and hopefully through that, to advance our efforts in *“Translating Discoveries.”*

Our MD and Masters in Medicine students will be the fourth consecutive class to enroll in the New Stanford Curriculum. The governing principles of the New Curriculum are to educate students concurrently in basic and in clinical science throughout their years in medical school – and beyond. Indeed, the interweaving of these disciplines is essential to modern medicine. Thus, in addition to Foundations of Medicine and Anatomy courses, first year students will also be taking a course on the Practice of Medicine. Considerable efforts have also been made to reduce the formal didactic teaching so that students can engage in small group learning as well as individual scholarship and pursuit. Relevant basic sciences courses are also being re-introduced in the clinical clerkship phase of medical education under the title of Applied Biomedical Sciences. In addition, by the time students begin their second year, individual scholarship is formalized by selection of a Scholarly Concentration that enables them to have a more in-depth exploration of an important issue or discipline (e.g., Molecular Medicine, Public Policy, Community Health, and Bioengineering – among others).

At this time our Stanford Curriculum is unique, and it matches the goals of our faculty and students in educating and training future leaders – including those who will pursue careers in academia and scholarship. These goals are consistent with Stanford's legacy and are highly relevant to our over-arching mission in *Translating Discoveries*.

Challenges to the NIH

The National Institutes of Health remains the world's most important supporter of biomedical research, and it has permitted the United States to be the global leader in advancing insights in the biosciences and their translation to human biology and disease. During the past several years a number of political, ethical and financial forces have converged on the NIH that, as a consequence, now threaten the future of the larger biomedical research community. As I have noted in prior Dean's Newsletters (see http://deansnewsletter.stanford.edu/archive/05_15_06.html) the greatest threat is the decline in the NIH budget, which is already negatively impacting the funding of new as well as renewing grant applications. Additional issues include the profound restrictions

on embryonic stem cell research that the NIH can support due to President Bush's religious proclamations, challenges to the peer-review process by the Congress, declines in support for graduate students, scandals regarding conflict of interest, and the politics surrounding the NIH reauthorization.

Reauthorization legislation consists of a broad-based policy review of a federal agency or program. While existing agencies and programs are often reauthorized every three to five years and, in some cases on an annual basis, NIH has not been reauthorized for over 13 years. Given federal budgetary constraints, and in follow-up to the 2003 Institute of Medicine report entitled, *"Enhancing the Vitality of the National Institutes of health—Organizational Change to Meet New Challenges,"* the House Committee with oversight authority for NIH began discussing more specific proposals for NIH two years ago.

This past week the House Energy and Commerce Committee released a new concept paper with the express intent of passing House legislation before Congress goes on recess at the end of this month. As I have stated previously, the committee believes it has drafted a proposal to enhance NIH's ability to develop and encourage research planning across NIH, strengthen the NIH Director's authority to coordinate NIH's research portfolio, and direct the development of standardized reporting requirements and data collection to promote greater accountability to Congress and the public.

Although many issues are still under discussion, below I will provide a very brief summary of the proposed legislation's key points.

The Energy and Commerce Committee's current concept paper proposes:

- Authorization of a 5% funding increase for fiscal year 2007 and for each of the following two federal fiscal years. Please understand that the authorization of funding is looked upon in Congress as a recommendation. Most budget analysts believe that actual funding will be at a level below the rate of inflation.
- The most controversial issue included in the proposal is the establishment of a "NIH Common Fund." The committee's intent is that this new structure will set up a funding mechanism to spur more "trans-NIH" research that will involve extensive collaboration between individual Institutes and Centers. Support from this fund would be awarded on a peer-reviewed basis. The committee has proposed that the fund be financed by a contribution of 50% of NIH's incremental funding increases over the next three fiscal years.
- The creation of a Division for Strategic Planning and Portfolio Management within the Office of the Director that would be tasked with developing broad based, trans-NIH planning for the agency.
- The establishment of a "Scientific Management Review Group" tasked with reviewing and making recommendations regarding the organization structure at

NIH. The group would include Institute and Center Directors and outside scientific experts. A mandated review will take place once every seven years.

- Uniform reporting requirements and improved data collection across NIH to improve transparency.
- Limiting the overall size of NIH to the existing 27 Institutes and Centers.

As I stated in a previous Dean's Newsletter on this issue (http://deansnewsletter.stanford.edu/archive/01_23_06.html), while I think that the current concept paper seems to support some recommendations from the IOM report and some ideas that many of us support (i.e.: some increased authority for the Director and better data collection and portfolio management) I have been very concerned about increasing the Common Fund while the NIH budget is flat to declining. I recognize that the Congress has some concerns about the NIH's impact since the doubling of its budget that was completed in 2003. However, I am keenly aware that the foundation of our biomedical research enterprise is investigator initiated research and that if that is damaged it will have an enormously negative impact on our future. Further I am very concerned about the increasing pressures that young faculty and investigators are facing in receiving NIH support, and I worry tremendously that this will discourage bright young researchers from entering and remaining in biomedical research careers. Accordingly, I am continuing to work through the AAMC Task Force that I co-chair with Bob Kelch from the University of Michigan to ensure that any proposed changes enhance the NIH's research mission rather than disrupt it. We also continue to work in a very constructive way with the House Energy and Commerce Committee.

I will keep you updated on this important legislative issue. I particularly want to thank Ryan Adesnik, Director of Federal Relations, for the enormously important role he is playing in this process. He has been truly invaluable. If you have any questions or suggestions, please don't hesitate to Ryan at radesnik@stanford.edu.

Challenges in Health Care: An Interesting Irony

On Saturday, September 9th I had the pleasure of attending a brunch hosted by the Cardinal Free Clinics for community physicians. It was an opportunity to witness the passion and commitment of our Stanford students to provide care to underserved communities. It also afforded an opportunity to acknowledge the important contributions and leadership by faculty advisors and medical directors (especially Drs. Rex Chiu and Lars Osterberg) as well as the community and staff physicians who volunteer their time to either the Arbor Free Clinic or the Pacific Free Clinic. These clinical programs are located in Menlo Park and San Jose respectively; they provide services on either Saturday or Sunday to adults and children, nearly 90% of who are uninsured. I want to thank the student managers for these clinics (Shirin Zarafshar and Asya Agulnik for Arbor Free Clinic and Yannis Paulus and Ian Chua for Pacific Free Clinic) along with their student colleagues for the dedicated commitment to service they each provide.

But there was an interesting and somewhat ironic message that emerged in the presentations of the students, residents, faculty and community physicians who volunteer at the Cardinal Free Clinics. Specifically, from different perspectives, each individual spoke passionately about how good they feel in participating in these free clinics, noting that they can spend time with patients and not get overwhelmed by paper work, productivity measures, etc. A common message was that they felt that they could truly function as compassionate physicians (or “doctors-to-be”) – which is different from how they feel in their regular positions, be those at Stanford or in a community office setting. And while these physicians and students were able to provide compassionate and patient-centric care to those without an ability to pay, it struck me how ironic it was that they didn’t feel this same satisfaction when caring for patients who were insured and who were visiting high-powered clinical services at Stanford or other community practices. Of course to all of us in medicine, that is not surprising.

The last decades have witnessed dramatic changes in medical care and in the role of the physician. While there is no doubt that at institutions like Stanford we are able to deliver the most advanced and technologically sophisticated health care, it is also true that most of our physicians and health care providers feel the stress of expectations for meeting volume or RVU targets. These are all consequences of the gradual migration of medicine from a profession to a business and in some cases, the changing role of the doctor from one who has the time to listen and to care compassionately for patients in need to one who operates by the clock. Ironically, volunteers at our Cardinal Free Clinics found that an environment without the time, bureaucratic and financial pressures and limitations permitted them to serve as “doctors” – something they expressed exhilaration in doing.

The further irony for me is that these messages were being conveyed at the same time as the State of California is beginning to grapple with its health care system. Of course California is not alone since our nation doesn’t really have an effective health care system – a travesty when compared to other developed nations around the world. While there have been attempts to move to some better organized health care system over the last several decades, those efforts have been thwarted by one special interest group or another. The current solution of letting the free-market drive health care and reduce cost has proved a failure at virtually every level. Disparity has increased, the numbers of uninsured have risen, and the overall costs of health care costs have continued to rise – with no demonstrable impact on health outcomes for the nation in comparison with other countries around the world. While it is not clear precisely which alternative approach or solution is best to pursue, it is also notable that the last weeks have seen activity by the California legislature in passing a bill for a single payer system. While there are certainly downsides to this approach, there are also many upsides – one of which is reducing administrative overhead that might permit doctors to serve patients rather than market forces. The current proposed single payer legislation will surely be vetoed by the Governor but one must hope that this is, at a minimum, a tangible step forward in developing a rational health care system – whether for California or for the nation.

I am pleased that those caring for patients at our free clinics feel inspired to function as health care providers. I will be even more pleased when we have a health care system that

allows doctors everywhere to have that same sense of satisfaction – and for their patients to believe that they are the beneficiaries of advanced medical care with compassion and sensitivity. Certainly we should be striving to achieve this combination across Stanford and to educate our students and trainees to achieve it in their professional careers and lives.

Stanford Begins New Relationship with the Palo Alto Veteran's Administration Medical Center

At the end of August, Stanford University and the Palo Alto Institute for Research and Education (PAIRE) signed an agreement that will transfer administration for all research conducted by Stanford faculty at the VA to PAIRE. In practical terms, this means that PAIRE will manage both pre- and post-award research administration for Stanford faculty conducting research that is primarily located at the VA. I believe that this arrangement will have many benefits for our faculty doing research at the VA.

The process that led to this agreement began in March 2004, when the Palo Alto Veteran's Affairs Health Care System and its associated foundation, the Palo Alto Institute for Research and Education (PAIRE), proposed that PAIRE take over the administration for all research conducted by Stanford faculty based at the VA. The motivation for this proposal was to improve the research infrastructure for Stanford faculty while also bringing in additional funding for the VA. Improvements would be funded in two ways: 1) through PAIRE's ability to negotiate a higher rate of indirect cost recovery under OMB Circular A-122 than Stanford is able to obtain under OMB Circular A-21 at the off-campus rate; and 2) through the increase in VERA (Veteran's Equitable Resource Allocation) dollars associated with increased research administration activities, half of which would be applied to the research infrastructure.

Task forces (one internal to Stanford and another with combined membership) were identified and began to meet in the summer of 2004. These groups struggled for many months with the complex issues raised by a transfer of administrative responsibility to PAIRE. To address this they established principles for the transfer, evaluated financial impact and effort required to make the transition, solicited faculty and chair input on the proposal, contacted other institutions with similar agreements, and began evaluating implementation options. In February 2006, the decision was made to move ahead with the transition. For the past several months, a Joint Operations Team - comprised of Donna McCartney and Mary Thornton from PAIRE, Rick Kraemer, M.D., from Stanford and the VA (and PAIRE Board Member), and Kathleen Thompson, Julia Tussing, Sara Bible and Pamela Webb from Stanford - has been negotiating details, finalizing the agreement, and pounding out an implementation plan. Dr. Artie Bienenstock, Vice Provost and Dean of Research and Graduate Policy, Professor at SSRL and of Materials Science and Engineering and of Applied Physics approved the final plan.

I would like to commend the many people from all three organizations who worked diligently to make this agreement a reality, one that will hopefully further strengthen our relationship with the VA. While there will be a continued administrative effort and cost

associated with the ongoing implementation of this change, I believe that our faculty will reap the rewards over time – which makes it worth doing.

Medical Development 2006

In anticipation of the upcoming University-wide campaign, the Stanford Challenge, our Office of Medical Development has been busy hiring staff and working with faculty to assemble new gifts and pledges. While there is much to be done, the good news is that as we close the books on the fiscal year that ended August 31, 2006, both the School of Medicine and Stanford Hospital & Clinics (SHC) have set new fundraising records. New gifts and pledges for the School of Medicine reached \$145.6 million (up from \$127.8 million in FY05, and \$98.7 million in FY04). Similarly, SHC achieved new gifts and pledges of \$10.3 million (up from \$8.6 million in FY05, and \$2.3 million in FY04). Behind these numbers are many friends and donors whose dedication to our mission is truly inspiring. Also behind the numbers is a great deal of work from many of our faculty, volunteers, and from our new team in the Office of Medical Development (OMD), to whom I am most grateful.

The rebuilding of the Office of Medical Development and Alumni Affairs, under the leadership of Doug Stewart, Associate Vice President of OMD, is itself an important accomplishment – and one we expect will pay big dividends as we move forward with our aggressive fundraising goals in the coming years. Restructuring and recruiting staff for the new OMD has been an arduous process, but I am encouraged by the progress. During the final months of this fiscal year we were able to recruit the last of the senior directors of development who will be responsible for guiding fundraising activities for all of the Institutes and related priorities. A number of additional recruitments are also underway for development officers to join these senior staff, and Doug tells me he expects to announce a new round of hires shortly.

The development activity at the Medical Center is not taking place in isolation. As I mentioned above, Stanford University plans to publicly announce a major, comprehensive campaign – The Stanford Challenge – this October, which features the Medical Center in a variety of cross-campus initiatives and priorities. From what I have seen, Stanford's fundraising results leading up to the public launch are going to be breathtaking. Watch for those announcements the week of October 9.

Mark Krasnow is New Chair of Biochemistry

I am very pleased to announce the appointment of Mark Krasnow, MD, PhD, as chair of the Department of Biochemistry. He succeeds Dr. Suzanne Pfeffer who has served with great distinction as chair since 1998. I would also like to thank and acknowledge Dr. Pfeffer for the tremendous work she did on behalf of the faculty during her years of service – and also the very important role that she served as a school and national leader. Dr. Pfeffer deserves our greatest thanks and appreciation.

Dr. Krasnow has had the opportunity to learn from Dr. Pfeffer, having served as Associate Chair from 2000 until the present. Mark received his MD and PhD degrees from the University of Chicago and has been a member of the Stanford faculty since 1988. He is currently Professor of Biochemistry and Investigator in the Howard Hughes Medical Institute. Dr. Krasnow served as the Director of the MSTP program from 1996-2002. He is a highly regarded investigator whose laboratory has focused on the genetic, cellular and molecular mechanisms that govern lung development using *Drosophila* as a model system. According to Dr. Krasnow's website, his lab is addressing "three basic questions: (1) What specifies the complex pattern of branching -- where each branch sprouts, the direction it grows, and when it sprouts again to form the next generation of branches; and how is this patterning information encoded in the genome? (2) How does an epithelium migrate and assemble into tubes of the appropriate size and shape? (3) How does oxygen influence the process?" It is his hope that this work will help elucidate normal and abnormal lung development – including lung cancer and other diseases.

I am most pleased to welcome Dr. Krasnow as our new chair of Biochemistry.

Search Commences for Director of Stanford Cancer Center Breast Oncology Program

The Stanford Cancer Center is seeking an outstanding clinician, investigator and leader for the position of Director of the Breast Oncology Program. The Search Committee has asked me to call this position to your attention in case you have any recommendations of potential candidates.

According to the position description,, the Director will be responsible for the organization and coordination of the Breast Oncology Program and its faculty members. This will include the clinical activities of the faculty who contribute to this program and the development and implementation of a comprehensive research program emphasizing the translation of laboratory discoveries into clinical trials.

Candidates are required to have an M.D. degree and be board-certified and fellowship-trained in an oncology-related specialty. Experience in a multidisciplinary clinical and research program in an academic medical center is required, as well as a record of productivity in clinical and translational research in breast cancer and related scholarly areas; she or he should also have significant leadership experience and be recognized as an effective team builder.

As you know, Stanford University is an equal opportunity employer and we are committed to increasing the diversity of its faculty. The Search Committee welcomes nomination of and applications from women and members of minority groups, as well as others who would bring additional dimensions to the university's research, teaching and clinical missions.

Questions regarding the search may be directed to Jonathan Berek, MD, chair, search committee, at 650.723.5533, or email (jberek@stanford.edu). Nominations (including

name and contact information) may be submitted directly to Kendra Baldwin electronically at kendra2@stanford.edu no later than **September 20, 2006**.

Upcoming United Nations Association Regional Conference at Stanford

On October 7, the School of Medicine is co-sponsoring with the Northern California Division, Mid-Pacific Region of the United Nations Association of the USA an all-day conference entitled *Can the United Nations Heal the World?* The conference will be held from 9:30 am to 6:00 pm in the Fairchild Auditorium (box lunches will be provided for those who register by September 22nd). The focus of the conference is the United Nations Millennium Development Goals. These are a set of clear, time-bound, and measurable development targets for combating poverty, hunger, disease, and environmental degradation, among others. Every UN member state agreed to them at the United Nations Millennium Summit in September 2000. Information about the Millennium Development Goals can be found at this web site:

<http://www.unausa.org/site/apps/s/content.asp?c=fvKRI8MPJpF&b=369041&ct=2221915>

The School's direct participation in the conference will consist of a morning Plenary Session entitled *Improving Health around the World: the Millennium Development Goals and Biomedical Science*. Speakers will include Drs. Jonathan Berek, Professor of Obstetrics and Gynecology, Yvonne Maldonado, Associate Professor of Pediatrics (Infectious Diseases), and by courtesy, of Health Research and Policy, Gary Schoolnik, Associate Professor of Pediatrics (Infectious Diseases), and by courtesy, of Health Research and Policy and Paul Wise, Richard Behrman Professor in Child Health. They will focus on the Millennium Development Goals that focus on health issues, which are:

To reduce child mortality - By 2015, reduce by two-thirds the mortality rate among children under five

To improve maternal health - By 2015, reduce by three quarters the ratio of women who die by childbirth

To combat HIV/AIDS, malaria, and other diseases - By 2015, halt and begin to reverse the spread of HIV/AIDS and the incidence of malaria and other major diseases

This promises to be an exciting conference. General admission, which includes lunch, is \$35/\$15 for students. Admission at the door will be \$35 general/\$15 student (no lunch provided). To register, please send a check made payable to UNA-USA, NCD to Mary Granholm, President UNA-USA Midpeninsula, 552 Emerson Street, Palo Alto, CA 94306 by September 22.

Appointments and Promotions

Philip A. Beachy has been appointed to Professor of Developmental Biology, effective 9/1/06.

James Ford has been promoted to Associate Professor of Medicine (Oncology) and Genetics, effective 9/1/06.

Anthony Oro has been promoted to Associate Professor of Dermatology, effective 9/1/06.

Thomas Wandless has been reappointed to Assistant Professor (Research) of Molecular Pharmacology, effective 10/1/06.

Dean's Newsletter

September 25, 2006

Learning About Clinical Research

At Stanford we have made a commitment to fostering clinical research and ***“Translating Discoveries.”*** This commitment is built on our strong tradition of outstanding basic science research that has long served as the foundation for creating new insights into human biology and for spawning new innovations and discoveries. Indeed, since the School of Medicine relocated to the Palo Alto campus in 1959, it has become recognized world-wide as a tower of strength in the biosciences. Without question our future success as a research-intensive school of medicine mandates that this foundation be sustained and enhanced in the years ahead. This tradition of excellence in basic science has been made possible by recruiting and supporting outstanding and remarkably talented faculty and students who have benefited from the climate of innovation and interdisciplinary interaction that characterizes Stanford University. This truly began in 1959, when Dean Robert Alway and Provost Frederick Terman, along with Professor Henry Kaplan, recruited Dr. Arthur Kornberg from Washington University to join Stanford. Dr. Kornberg agreed to come to Stanford only if he could bring his entire department with him – which he did - and thus began the School's incredible foundation in biochemistry. This was soon further enhanced when Dr. Kornberg and his new Stanford colleagues recruited Dr. Joshua Lederberg to establish a new department of Genetics at Stanford. These two individuals truly nucleated the new beginnings of the Stanford School of Medicine. The fact that both were also recent Nobel Laureates cemented that foundation in gold!

At the same time that the Stanford University School of Medicine was growing and developing in Palo Alto, the NIH was also expanding its support for biomedical research. Much of this new support was directed to investigator- initiated inquiry, largely through the funding mechanism known as the RO1 award. Stanford has always excelled in the competition for these research awards and currently has the highest amount of funding per faculty of any medical school in the nation. Indeed Stanford has been viewed by its peers as an outstanding example of a highly successful “RO1 culture.”

But the cultures of academic medical centers as well as funding agencies like the NIH have been changing. To sustain excellence, Stanford must continue its successful base of

fundamental research but also build opportunities for more interdisciplinary or program project organized research. Further, it must enrich its efforts in clinical and translational research. This requires new education and training programs and a commitment by faculty and students to both sustain tradition and build a future that will be different from the past.

Stanford is not alone in this evolution. Thirty years ago I was completing my first fellowship at the NIH and working on the molecular biology of herpes viruses, particularly the Epstein Barr virus. Over the subsequent decade my laboratory research interests shifted to questions that addressed problems that I was encountering in the clinic. When opportunities arose to move research-related observations or discoveries to the care of patients, however, the guideposts on how to do this were woefully lacking. There were no courses, texts, or even advisors who were truly knowledgeable – especially when these trials were to take place in children with life-threatening disorders. Accordingly I, along with others of my generation, needed to use self-discovery and trial and error to develop the framework for clinical investigation. Even when these efforts were successful, they consumed enormous personal and professional energy. This was not made easier by the fact that the academic reward systems did not favor clinical and translational research, and many felt it was simply not on the same intellectual plane as more basic fundamental investigation.

I won't pretend that the attitudes about the value of basic versus clinical research within many leading institutions have dramatically changed today – but I will note that the climate for fostering career development and supporting training and research in clinical and translational research is undergoing a sea change. Some of this reflects the interest and attitudes of students and faculty, but a not insignificant factor is the funding climate of the NIH – which has put clinical, and translational research front and center. I have described in a recent Dean's Newsletter (<http://deansnewsletter.stanford.edu/#4>) the impact of this change on the reauthorization of the NIH and the direction of funding to the "NIH Roadmap" and on the recently announced "Clinical and Translational Science Awards" (see below).

Since the inception of our School of Medicine Strategic Plan, ***"Translating Discoveries,"*** in early 2002, we have been marshalling resources to support increased efforts in clinical and translational research. These efforts embrace our missions in education, research and patient care. For example, our New Stanford Curriculum, which commenced in the Fall of 2003, provides opportunities for students to engage in a wide range of research venues, including clinical research, through the Scholarly Concentrations. In coming years, in an effort to develop greater continuity between undergraduate and graduate medical education, we plan to explore ways to expand these Scholarly Concentration opportunities to residents and fellows. In doing so, I hope we can better connect education in biomedical science with patient care through the medical school and residency sojourn than has traditionally been accomplished. In the next year or so we will also be offering opportunities for clinical fellows who have become committed to research to pursue an advanced degree, if doing so would enhance their career development as a clinical investigator. Concurrently we are also providing opportunities

for students pursuing a PhD degree to learn more about clinical medicine through the Masters in Medicine degree, which is in its first year. These various opportunities are all aimed at training a cadre of physicians and scientists who will become leaders and who will be deeply knowledgeable about the interface between science and medicine.

In conjunction with our efforts to develop clinical and translational research through our interdisciplinary Stanford Institutes of Translational Medicine, we have also been developing ways to enhance and develop the infrastructure to support clinical investigation. The Stanford/Packard Center for Translational Research in Medicine (SPCTRM), currently led by Drs. Harry Greenberg and Steve Alexander and Nick Gaich, has evolved over the past couple of years to become an important foundation for our clinical research infrastructure (see: <http://clinicaltrials.stanford.edu/>). This past week SPCTRM joined with the Child Health Research Program (CHRP) and the department of Health Research and Policy to conduct a week-long “Intensive Course in Clinical Research: Study Design & Performance.” This initial program effort was focused on pediatric research and was attended by 28 pediatric clinical investigators, most of whom are in the early stages of a career in clinical investigation. The course was divided into modules that focused on key issues such as clinical research methodology, randomized clinical trials, the design of observational studies, interventions and endpoints, statistical inference, sample size, determination and statistical power, the ethics of research in children, finding, informing and studying research volunteers, basic operations for study contact, investigator related issues in clinical trials, and a series of discussion and practice small group modules.

The early feedback from the participants is that this course was really excellent. It is our hope that it will be the first of a series of programs oriented toward equipping young investigators with the knowledge and skills to develop their careers in clinical and translational research. Clearly this will be an ongoing and iterative process, but I am very pleased to take note of its occurrence and will look forward to announcing future programs.

I want to thank in particular Steve Alexander, Christy Sandborg and Phil Lavori for their effort and leadership in bringing this course to fruition.

Moving Toward a CTSA

Preparations for our application to the NIH for a CTSA (Clinical and Translational Science Award) are well underway under the leadership of Dr. Harry Greenberg, Senior Associate Dean for Research and Joseph D. Grant Professor of Medicine, who will serve as the Principal Investigator of our CTSA application when it is submitted in January 2007. Last year we made the decision to first submit a planning grant application to NIH for our CTSA efforts, and I am pleased to say that we received notice this past week that our planning grant has been approved and funded. Dr. Michael Longaker, Deane P. and Louise Mitchell Professor of Surgery, served as the PI for that application, and I want to thank and commend him for his very significant efforts. I also want to thank the other Stanford faculty who played important roles in this application, including Drs. Harry

Greenberg, Alan Krensky, Phil Lavori, Bill Mobley, Daria Mochly-Rosen, Brandy Sikic, David Stevenson, Paul Yock, Steve Leibel, John Boothroyd, Bev Mitchell and Chris Webb. The planning grant is just a step in the process of receiving CTSA status – but it is an important beginning.

During the summer Dr. Greenberg worked intensively with Co-PIs Charles Prober, Phil Lavori, Brandy Sikic, and David Stevenson, along with the Project Leaders, to develop the comprehensive program that will define the Stanford CTSA application. By way of comparison, almost every institution around the country that is preparing for a CTSA application views this process as being as monumental (or perhaps even more so) as applying to become an NCI-Designated Cancer Center. Given the competition for these awards, the effort in putting a successful application in place is intense. It is my hope that the efforts we have already put forth as part of our mission in *Translating Discoveries* will provide the right grounding and home for our CTSA efforts. Accordingly, our Stanford Institutes of Translational Medicine, comprehensive education and training programs, and burgeoning support for clinical research should provide evidence of our commitment and excellence in this area of research.

To continue our progress on the application process, Dr. Greenberg led a very successful half-day retreat on Saturday September 23rd. The goal of the retreat was to define and refine the status of the CTSA application and to determine which areas need additional effort. I was pleased to attend this retreat, and I observed that in addition to the excellence of the proposals that are coming forward, the group of involved faculty are interacting in a very creative way that I am sure will not only help our application but also our ability as an institution to carry out outstanding clinical and translational research. An external advisory committee is also being assembled to provide critical advice about our application so we can do everything possible to make our proposal as strong and compelling as possible.

Clearly more will follow on this extremely important endeavor.

Special Thanks to Jill and John Freidenrich

Despite the quality of our faculty and students and our commitment to excellence, we simply could not be fully successful without the incredible devotion of our friends and supporters. Indeed great institutions like Stanford owe a great debt of gratitude and respect to members of our community who have shared their time, energy and personal resources with us. Among the many individuals who have become such wonderful friends of Stanford, I want to thank in particular Jill and John Freidenrich, whose extraordinary gift of \$25 M was formally announced this past week (see: <http://news-service.stanford.edu/news/2006/september13/med-freidenrich-091306.html>). As we work diligently to fulfill our mission in *Translating Discoveries* and to further develop our efforts in clinical research, their gift to establish the Jill and John Freidenrich Center for Translational Research at Stanford will provide a critical underpinning to our efforts. We cannot thank them enough for this extraordinary gift. Jill and John have been deeply committed to Stanford and the Medical Center for decades and are among the most highly respected individuals in our community. I am also honored to count them as

friends whom I have had the privilege to get to know personally. Indeed my wife, Peggy, and I have deeply valued their personal warmth, care and compassion – their commitment to family, children and grandchildren – and their concern for making the community and world we live in a better place. Thanks Jill and John!

Stanford Continues to Lead the Nation in Pioneer Awards

On Tuesday September 19th I received a call from Dr. Elias Zerhouni, Director of the National Institutes of Health. He had just served as convener of a group making the announcement of the 2006 NIH Pioneer Awardees and could not help observing that among the 13 recipients from around the nation, three are faculty from Stanford. He also did not fail to recognize that in 2005, when 11 Pioneer Awards were made, three were also from Stanford. In fact since their inception three years ago, 7 of the 34 Pioneer Awardees are from Stanford. By any measure this success rate is truly remarkable, and it certainly speaks to the extraordinary faculty we are privileged to have at Stanford. In his call, Dr. Zerhouni commented, “Phil, you are clearly doing something right at Stanford.” Of course it is easy to agree with that sentiment – but the reality is that our colleagues at Stanford have worked diligently to recruit, retain and support outstanding faculty. This year’s three new pioneer winners are Dr. Kwabena Boahen, PhD, Associate Professor of Bioengineering; Karla Kirkegaard, PhD, Professor and Chair of Microbiology and Immunology; and David Relman, MD, Associate Professor of Medicine. Each is an outstanding example of creativity, innovation and exciting scholarship.

At a time when the NIH is undergoing considerable challenge due to reductions in budget and the challenges of reauthorization, the Pioneer Awards represent a beacon of hope. Not only are these prestigious and highly competitive awards (there were 465 applications for the 13 awarded this year), they are also significant in their value (\$2.5M per award) and perhaps most importantly, in selecting investigators and research proposals that offer future promise rather than past performance. By recognizing and supporting faculty for innovation and forward-looking research, the NIH is helping to redefine its own mission – which is also quite welcome.

Needless to say the honor and credit goes to each of Stanford Pioneer Awardees. But this latest achievement also speaks well for Stanford – and is something we can all feel proud about.

Update on the NIH Reauthorization Bill

In the last issue of the Dean’s Newsletter (<http://deansnewsletter.stanford.edu/#4>) I wrote about the activities underway regarding the reauthorization of the NIH. As I conveyed in that article, this has been a challenging process. However, during the past two weeks significant progress was made in helping to shape the legislation in a way that is much more supportive to our national biomedical research initiatives and to the directions previously recommended by the Institute of Medicine of the National Academy of Sciences. Accordingly, a number of major organizations, including the Association of American Medical Colleges (AAMC), Association of Academic Health Centers (AAHC) and the Federation of American Societies for Experimental Biology (FASEB) came together to lend their endorsement (with some important caveats) to the bill that was

introduced by Congressman Joe Barton (R-Texas). Based on those efforts, on September 20th the House Energy and Commerce Committee approved legislation to reauthorize the National Institutes of Health for the first time in more than a decade. At the end of the mark-up, Energy and Commerce Committee Chair Barton indicated his intent to take the bill to the House floor the week of September 25th under the suspension calendar.

Among the key features we were concerned about was that the NIH budget increase be at least 5% and to hold the increase of the Common Fund to 5% with a requirement to evaluate the impact of the Common Fund from both a positive and negative perspective once it achieves the 5% level. Both of these elements are in the bill. There were a number of amendment proposals, and there is little doubt that additional changes may be proposed when the bill goes to the House floor and then to the Senate. But it is likely that the fundamental principles now in place will be sustained. At least from my point of view, they will offer some opportunities for the NIH to improve its role as the major supporter of biomedical research in the world.

Engaging in a National Dialogue on Conflict of Interest

On Wednesday, September 20th I participated in “A National Dialogue on Biomedical Conflicts of Interest and Innovation Management” at the Cleveland Clinic. The conference featured speakers from academia, industry, and government and was moderated by Nina Totenberg, NPR Legal Affairs Correspondent. In my introductory comments I traced the history of academic medicine during the past half century, focusing on the remarkable growth of the national enterprise in general and the extraordinary innovations and discoveries that have improved the diagnosis, treatment and prevention of human disease because of the support for research from the NIH and the successful interactions with industry – including Pharma, biotechnology and the device industry. I also pointed out that the success of academic medical centers has become increasingly challenged by periods of downturns in NIH funding (such as is the case presently) and the decreased clinical margins resulting from the era of managed care and the efforts to curtail rising costs of health care through marketplace-driven corrections. These have resulted in limitations in the resources of academic medical center and difficulties in cross-subsidizing the cost centers associated with education and research.

At the same time I pointed out that during the same period of growth in academic medicine, the pharmaceutical (including device) industry has also grown. While a number of major companies have invested considerable resources in research and development, the striking costs for developing new drugs (estimated as between \$800M to \$1.2B) have dampened innovation at a number of companies, which have instead focused efforts on big-selling “blockbuster” drugs, often with considerable marketing. In fact today Pharma invests more than \$20 billion per annum in marketing – a very significant proportion of which is directed at doctors.

There are clear reasons for constructive and productive partnerships between academia and industry. While many of the molecular targets for eventual drug development arise through basic research carried out in academia, the eventual translation of these

discoveries into actual products requires productive partnerships with industry. Certainly this occurred in a highly successful manner during the early stages of molecular biology and genetic engineering, during which much of the biotechnology industry as we know it today was born. In fact, Stanford played a major role in these efforts.

The potential for productive interrelations of academia with industry also lead to the establishment of Offices of Technology Licensing and, again, Stanford established one of the earliest and most successful of these programs. Of course this transcends biomedical research and includes the extraordinary advances that have taken place in engineering, computer sciences and information technology. As a measure of Stanford's success, a recent report from the Milken Institute noted that the University of California system and Stanford are leaders in published research, patents and startups that they have spawned. In fact Stanford ranks fourth in the list of universities most successful at commercializing its research – following MIT, the UC system, and the California Institute of Technology.

Clearly, when appropriately managed, the interaction between academia and industry can be highly successful in fostering innovation and in translating discovery for the human good. But this is also a relationship fraught with hazards and dangers, especially when human subject research is involved.

Finding the correct balance is essential – and as is making sure that the relationships between academia and industry do not damage individuals, institutions or, perhaps most importantly, the public trust. While I feel confident that most faculty and investigators want to do the “right thing,” human behavior is such that motivations can be swayed, especially when career or financial advancement is involved. For these reasons it has been important for institutions to develop guidelines and policies regarding conflict of interest. In essence, a “conflicts of interest” arise whenever individuals' personal needs come into conflict with their responsibilities to their primary institution – in our case, Stanford University. Recognizing this, every medical school and academic medical center adopted policies regarding conflict of interest during the 1990's. At Stanford formal policies were instituted in 1994 and continue to this day. While some argue that such rules are unnecessary, the evidence is to the contrary. While I have no doubt that most faculty behave with high ethical motivations, everyone benefits from knowing the “rules of the road”. And, of course, in any large system, regardless of whatever rules or policies are put into place, some individuals will ignore or disregard them – placing themselves and their institution at considerable risk.

The Stanford policies on Conflict of Interest – which include financial and non-financial conflict as well as conflict of commitment and institutional conflict - are well described on our website (<http://med.stanford.edu/coi/>), and I refer you to the guidelines and the fact sheet for reference. At Stanford we recognize that conflicts of interest are inherent in nearly everything we do and it is not our intent to eliminate them *per se*. In fact doing so would stifle innovation, discovery and the advancement of medicine and science. Rather we want to be sure that the conflicts between individuals (and the institution) with industry are transparent and that if certain “red flags” are raised (e.g., human subject research, exceeding financial thresholds) that these potential conflicts are carefully and

independently reviewed and managed. When conflicts are deemed unmanageable the interactions is not allowed. Not infrequently, the perception of conflict is as important as the actual interaction since preserving the public trust is of critical concern.

While the interactions between industry and academia to foster innovation are important, even though they require careful management, I view the issue of marketing by industry to doctors and investigators as quite another matter. Of course this is not to deny that industry has a need to market its products but rather to emphasize the importance of not having the clinical decision making by our students or faculty influenced by marketing or various enticements such as gifts and meals. For these reasons Stanford has recently introduced new policies which become operative on October 1st to ban such activities (<http://med.stanford.edu/coi/siip/>). At the National Dialogue meeting I mentioned above, I shared a panel discussion with Dr. Roy Vagelos, the esteemed and highly respected former CEO of Merck. He affirmed that industry does spend an inordinate amount on gifts and meals for doctors and “educational events” as a way to market their products. Indeed he noted that if this strategy didn’t work, industry would not be spending the more than \$20 billion a year that it currently spends.

I should note that while some have criticized our new policy, which we announced on September 12th, because it eliminates gifts and other enticements from industry at the Stanford Medical Center (see: <http://med.stanford.edu/coi/siip/>), most have applauded it. In fact, since we announced this policy a number of academic medical centers have contacted us to request their use of our recommendations. As I have noted in other settings, our primary purposes for instituting the Policy and Guidelines for Interactions between the Stanford University School of Medicine, the Stanford Hospital and Clinics, and Lucile Packard Children's Hospital with the Pharmaceutical, Biotech, Medical Device, and Hospital and Research Equipment and Supplies Industries ("Industry") is to create an environment that optimally supports the education of our students and trainees and that helps us better secure the public trust. In fact, at the National Dialogue meeting Nina Totenberg and keynote speaker Dick Thornberg, former US Attorney General, Governor of Pennsylvania and Director of a publicly traded pharmaceutical company, observed that if the medical community is unable to take more responsibility in regulating itself regarding conflicts of interest, they felt sure that regulations will be imposed from other, higher authorities. Clearly that is further evidence of how close to the line some of these issues have become in the public eye.

So, the critical issue is doing all we can to foster the successful and appropriate interactions of academia with industry while, at the same time doing all that we can to prevent unmanaged or hidden conflicts that squander our good will with the public and the patients we serve. I believe that we do an excellent job at Stanford in these efforts – but that we must remain vigilant. And, when all is said and done, it is really individual responsibility that will define our ultimate success or failure. And failure is not something we can accept or tolerate.

A New Epic for Stanford Hospital & Clinics

An effective electronic medical record has been a long-standing promissory note. Unfortunately, most claims of success have been institution- specific and not readily transportable or adaptable to academic medical centers. That is now changing. This past week I had the opportunity to attend preview exhibitions of the Epic Information System that SHC has selected for installation in February 2008. This effort will be led by Dr. Kevin Tabb, Chief Quality & Medical Information Officer and Carolyn Byerly, CIO at Stanford Hospital & Clinics. It will require an enormous amount of preparation, engagement and education by our faculty over the years ahead. When implemented the Epic Information System will provide an electronic medical record for the inpatient and outpatient services at SHC as well as to the clinical programs that will be located at the North Campus or other clinical sites.

To learn more about how the Epic Information System is working at other academic medical centers where it is currently operative, we visited the Cleveland Clinic and Loyola Medical Center on September 21st and 22nd. These sites were chosen because they have similarities to what will be installed at Stanford Hospital & Clinics.

Because faculty leadership will be so important to the success of Epic at Stanford, these site visits predominately included clinical chairs and faculty leaders including Drs. Greg Albers (Neurology), George Fisher (Medical Oncology), Rob Jackler (Otolaryngology), Quynh-Thu Le (Radiation Oncology), Henry Lowe (IRT and General Medicine), Bill Maloney (Orthopaedic Surgery), Ron Pearl (Anesthesia), Geoff Rubin (Radiology), Larry Shuer (Neurosurgery), Richard Sibley (Pathology), Paul Wang (Cardiology), Mark Welton (Surgery). Hospital leaders included Martha Marsh, President & CEO, in addition to Kevin Tabb, Jerry Shefrin and Carolyn Byerly. The visits were extremely informative and it was exciting to see what an Epic EMR at Stanford might look like. At the same time it was also sobering to recognize the many issues that will need to be addressed to make this project successful. To begin the dialogue with faculty Epic will be at SHC on September 26-27th to demonstrate various features of their system. I would strongly encourage as many faculty as possible to attend one of these sessions (see below) so you can witness what is now available and begin to engage in making the future Stanford installation of Epic as successful as possible.

The schedule and location of the sessions is listed below. Please note that in accordance with our policies on industry interactions, the food or meals at these sessions will be provided by SHC and **not** by the vendor.

TIME	TOPIC	LOCATION
September 26, 2006		
7 – 9 am	Epic Physician Tools & Workflows - Inpatient	HH141 GCRC
7 – 9 am	Epic Physician Tools & Workflows - Ambulatory	H330 OB/GYN
10 am – 12 pm	Epic Oncology System Demonstration	Cancer Center
11 am – 1 pm	Epic Physician Tools & Workflows - Ambulatory	Beckman 200
5 – 7 pm	Epic Physician Tools & Workflows - Inpatient	H3680
5 – 7 pm	Epic Physician Tools & Workflows – Ambulatory	H330
5:30 - 7:30 pm	Epic Emergency Department System	701 Welch Rd,

September 27, 2006

7 – 9 am	Epic Physician Tools & Workflows - Inpatient	G330 -
7 – 9 am	Epic Physician Tools & Workflows - Ambulatory	Blake Wilbur
11 am – 1 pm	Epic Physician Tools & Workflows - Ambulatory	HH141 GCRC
12 – 1 pm	Epic Physician Tools & Workflows - Inpatient	S101
5 – 7 pm	Epic Physician Tools & Workflows - Inpatient	HH141 GCRC
5 – 7 pm	Epic Physician Tools & Workflows - Ambulatory	H330
5 - 6:30 pm	Epic Oncology System Demonstration	Cancer Center

Please make an effort to attend one of these sessions.

Thanks to Professor Suzanne Pfeffer

I want to thank Dr. Suzanne Pfeffer for the outstanding job she did as chair of the Department of Biochemistry from 1998 – 2006. Since the School of Medicine moved to the Stanford campus in 1959 the Department of Biochemistry has been one of the true jewels in our crown. During her tenure Dr. Pfeffer played a key role in recruiting and retaining outstanding faculty and, equally importantly, in mentoring and guiding the career development of graduate students and postdocs. Not only did Professor Pfeffer provide leadership in this area at Stanford, she concomitantly provided national leadership in mentoring, especially for women in science, during her service as President of the American Society for Cell Biology. I am especially grateful to Professor Pfeffer for her commitment and leadership to the School's strategic plan and to her role as an institutional leader. Her passion for education has been notable and included her willingness to serve on our Medical Student Admissions Committee – where she also played a key role in better defining our commitment to the education of physician-scientists and physician-scholars. Importantly, despite her many administrative and leadership roles, Suzanne continued to be a very successful investigator and role model for our community at Stanford and beyond.

A Faculty Development Opportunity

The Office of Diversity and Leadership is sponsoring a Negotiation Skills workshop led by Dr. Margaret Neale, Stanford University Graduate School of Business.

Date: December 5, 2006

Time: 4 p.m. to 8 p.m. with dinner served

Place: The Schwab Center

Register by contacting Barb Miller at bemiller@stanford.edu

The workshop objectives are: to gain both an intellectual and experiential understanding of the process of negotiation, including the different types of negotiation, as well as strategies for maximizing individual and joint outcomes in various situations; to improve the participants' strategic and analytical abilities to assess and develop negotiating plans, including incorporating the likely behavior of a negotiating opponent; and to develop

confidence and provide experience in the negotiation process, including learning to analyze and evaluate the costs and benefits of alternative actions.

I encourage interested faculty to take advantage of this opportunity, which promises to be an excellent experience. I understand that space is limited, so you are urged to register early

A California Initiative to Decrease Smoking – Especially for Teens

I want to call your attention to Proposition 86, slated for the November 7, 2006 ballot, which increases the state's tobacco tax by 13¢ per cigarette (\$2.60 per pack) in order to reduce smoking in California. Hopefully this would impact on teens by discouraging them from smoking. In fact the data show that nearly 4000 children less than 18 years of age in California become daily smokers each month. Increasing the tobacco tax will hopefully further limit the initiation of smoking by teens. The tobacco tax would in turn be used for various health treatment and services as well as research in the control of tobacco and tobacco-related diseases. I would encourage you to learn more about Proposition 86 prior the November elections.

Upcoming Events

16th Annual Jonathan J. King Lecture

On Wednesday October 18th, Harold Freeman, MD, President and Medical Director of the Ralph Lauren Center, will give the 16th Annual Jonathan J. King Lecture for Cancer Care and Prevention. He will address Poverty, Culture and Social Injustice: Determinants of Health Disparities. The lecture will be held at 5 pm in the Fairchild Auditorium. For additional information, call the Center for Biomedical Ethics at 650-723-5760.

Dr. Vivian Pinn to Speak at the School of Medicine

Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership, has let me know that Dr. Vivian Pinn, Director of the Office of Research on Women's Health at the National Institutes of Health, will speak on October 17, 2006 from 12-1 in the Clark Center Auditorium. The title of her lecture is "Women and Minorities in Biomedical Careers." She will share new research as well as respond to questions.

Dr. Pinn served on the faculties of Howard University, Harvard University and Tufts University prior to joining the NIH. She graduated from the University of Virginia, School of Medicine, as the only African American and the only woman in her class. I want to encourage all faculty and students to attend Dr. Pinn's presentation, and I also want to thank Dr. Valentine and her Office for arranging for Dr. Pinn's visit to Stanford.

5th Annual Fall Forum on Community Health and Public Service

Save the Date: Tuesday, October 17 from 5:30-7:30 pm in the Frances C. Arrillaga Alumni Center. The keynote speaker will be Barbara Staggers, M.D. MPH, Division Chief of Adolescent Medicine at Children's Hospital & Research Center at Oakland. For more information visit <http://och.stanford.edu>.

Awards and Honors

We are proud to announce that **Geoff Krampitz**, a Graduate Student in Medicine, is a winner of the Paul and Daisy Soros Scholarship. The Paul and Daisy Soros program was established in 1997 and recognizes the extraordinary academic achievements of immigrants or children of immigrants. Congratulations, Geoff!

Dr. Mark Davis, Burt and Marion Avery Professor in Immunology has been selected as an Ellison Medical Foundation Senior Scholar in Aging for 2006. The program is designed to support established investigators, working at institutions in the U.S., to conduct research in the basic biological sciences relevant to understanding aging processes and age-related diseases and disabilities. Congratulations, Dr. Davis.

Appointments and Promotions

Steven D. Chang has been promoted to Associate Professor of Neurosurgery, effective 9/1/06.

Athena Cherry has been reappointed to Associate Professor of Pathology and Pediatrics, effective 9/1/06.

Bruno DeMediros has been appointed to Assistant Professor of Medicine (Hematology), effective 9/1/06.

Raymond Gaeta has been reappointed to Associate Professor of Anesthesia, effective 9/1/06.

Kristin Jensen has been appointed to Assistant Professor of Pathology at the Veterans Affairs Palo Alto Health Care System, effective 8/1/06.

Nishita Kothary has been appointed to Assistant Professor of Radiology, effective 9/1/06.

David Liang has been promoted to Associate Professor of Medicine (Cardiovascular Medicine), effective 9/1/06.

Sandhya Srinivas has been promoted to Associate Professor of Medicine (Oncology), effective 9/1/06.

Dean's Newsletter

October 9, 2006

An Affirmation of Basic Science as the Foundation of Biomedical Research and Academic Medicine

By any measure this has been an amazing time for the School of Medicine. The past week's announcement of two Nobel Prizes, which followed the awarding of three NIH Pioneer Awards a couple of weeks ago and the Kyoto Prize during the summer, represents a measure of success that is simply nonpareil. And while these extraordinary awards are stunning and represent levels of remarkable individual accomplishment, they have occurred in a setting in which research is highly valued and where excellence is sought and cherished. This has been very much part of the history of the Stanford School of Medicine – particularly over the nearly 50 years that have passed since Provost Fred Terman and President Wallace Sterling made the remarkably visionary and forward looking decision to move the medical school from San Francisco to Palo Alto.

As I have noted in recent Dean's Newsletters (see <http://deansnewsletter.stanford.edu/>), the foundations of the second half-century of medical school were laid down in 1959 when Fred Terman, Wallace Sterling and Henry Kaplan recruited Dr. Arthur Kornberg to Stanford as the chair of the Department of Biochemistry. Dr. Kornberg made the prescient and incredibly important decision that he would only come if he could bring his entire department from Washington University. And indeed his colleagues joined him here at Stanford and went on to have enormously distinguished careers. One of them, Paul Berg, not only joined Dr. Kornberg at Stanford but also joined him in the ethereal echelons by, like Dr. Kornberg himself, winning a Nobel Prize. Moreover, Dr. Kornberg played a key role in recruiting another Nobelist, Josh Lederberg, to found a Department of Genetics at Stanford – which joined with Biochemistry in becoming the cornerstones for academic excellence and basic research at Stanford.

In these nearly 50 years, many outstanding faculty have been recruited and new basic science departments created, always with excellence as a foundation.. The discoveries these stellar faculty have made have generated new fundamental insights into human biology and the broader biosciences, yielded new innovative technologies, fostered collaborations across the medical school and university, spawned biotechnology and increasingly led to discoveries that are being translated into improving the diagnosis, management and prevention of human disease. To a great degree this work has been supported by the NIH through its peer-reviewed competitive grant process, in which Stanford faculty have clearly excelled.

The fact that two Stanford faculty have been awarded Nobel prizes this past week is of course remarkable but also not surprising, given the excellence of the Medical School's investigators and academic community. We celebrate the achievements of two extraordinary scientists whose findings cut to the foundation of life – the elegant elucidation by Roger Kornberg and his colleagues of the molecular machinery that permits DNA to transcribe its genetic code to messenger RNA in order to make protein, and the insightful discovery by Andy Fire, Craig Mello and their colleagues of a

previously unrecognized double-stranded RNA that in essence silences genes to prevent the production of protein. Together these discoveries represent a ying and yang of genetic control.

Importantly, each of these discoveries underscores and epitomizes the importance of basic research and the reality that discoveries having far-reaching implications are often not appreciated when they begin. Andy Fire's work built on findings in plant biology, uncovered a fundamental insight in the worm and then recognized its generalizability to all of biology as well as its extraordinary implications for understanding genetic regulation through selective and specific gene silencing and its current and potential applications.. These findings unfolded rapidly with a seminal publication in 1998 based on work carried out at the Carnegie Institution's Department of Embryology and Johns Hopkins University and now continuing at Stanford as well as in laboratories around the world.

Roger Kornberg's research efforts have spanned decades and have elegantly described the processes and molecular machinery involved in transcription at the atomic level. This extraordinary tour de force required a university like Stanford since it was the collaboration with chemists, physicists, computer scientists and the availability of the Stanford Synchrotron Radiation Laboratory at the Stanford Linear Accelerator (SLAC) that allowed Roger's innovative research to unfold with such remarkable clarity.

Equally importantly, this significant work, like all of biomedical science, would not have been possible without the investment of the National Institutes of Health in basic biomedical research. America has led the world in basic research and scientific discovery in no small part because of the NIH. Of course this is an affirmation of the creativity of individuals and teams of scientists working in supportive environments - but their work would not have been possible without the support of the NIH. And while virtually every poll taken demonstrates the commitment and support of the American people to scientific discovery, we are entering a time when our scientific enterprise is seriously threatened.

Ironically, this comes after a period in which the NIH budget doubled (although the past three years have witnessed flat to declining budgets). A positive consequence of the dramatic increase in the NIH budget during the last years of the 20th century and the beginning of the 21st was the attraction of many more individuals to scientific careers. Indeed, from 1995 to the present, the number of scientists submitting grant applications to the NIH increased from approximately 19,000 to 37,000, and the number of grants during the same period increased from 24,000 to 49,000. Without question the availability of funding resulted in the recruitment of a large number of new investigators eager to pursue careers in biomedical research. That is great news – but it came at a price. Now that the support for the NIH has declined, the success of NIH applications is falling sharply. If this trend continues, it seems inevitable that a promising new generation of scientists will be discouraged or simply unable to succeed – thus squandering the nation's investment in fundamental research.

Further, unlike in years past, the Congress seems to have become disenchanted with the NIH, which not too long ago was viewed as the jewel in the crown of federal agencies. In part this change in attitude is due to the unrealistic expectations by some members of Congress regarding outcomes resulting from the doubling of the budget. As we all recognize, an investment in basic research means elucidating the fundamental mechanisms of life. Certainly some of this research will ultimately translate into applications that can impact human disease. But that translation may take years, if not decades, and, as we well recognize, it cannot necessarily be predicted at the outset of any particular line of research. Importantly, every important application to current medical care is built on basic science discoveries that took place in the past. If we fail to support this research our nation will, in essence, be cutting off its future pipeline of discovery – and application. Thus, as we celebrate the wonderful news of our two Nobel Prize winners, we also need to do what we can – individually and collectively - to become advocates for the continued support of basic research so that we all can have the opportunity to celebrate such extraordinary achievements in the future.

New Graduate Students Begin

Perhaps more than any other medical school in the nation, Stanford is unique in having a comparable number of entering PhD students as it does MD students. This comparability is consistent with our institutional goal of educating and training future leaders in the biosciences and in medicine – and, when possible, looking to their interface, especially as we address our overarching mission of *Translating Discoveries*.

On Monday, September 25th, we welcomed our incoming MS and PhD graduate students. The incoming class is comprised of approximately 53% men and 47% women from 26 states (the largest being California) and 15 countries (with China and Singapore accounting for the largest proportion of foreign graduate students). Although there has been continued progress in the admission of unrepresented minority students to our PhD programs, continued efforts are needed and are being actively pursued through the Office of Diversity.

Entering students did their undergraduate training at more than 50 colleges and universities. Harvard, UC-Berkeley, Stanford, MIT, Cal Tech and Penn contributed proportionally higher numbers of students than the others. Of the admitted students, approximately 54% chose to come to Stanford. Of those who elected to accept another offer, 46 % chose Harvard, UCSF and UC-Berkeley.

Incoming students are admitted through CGAP (co-chaired by Professors Tim Stearns and Will Talbot) and one of 15 departments or IDPs (Interdepartmental Programs). We are pleased to have an outstanding group of new students with a broad range of knowledge and interests, and I am most pleased to welcome them to our Stanford family. While learning science and carrying out research are our highest priorities for our students, it is also our hope and expectation that they will develop into leaders and will help to shape the future of biomedical research as well as science policy for the 21st Century. I am also confident that our students – along with our entire community – were

inspired by last week's announcements of Nobel Prizes for Stanford faculty members Andy Fire and Roger Kornberg!

Transitions and Renewed Focus on Education

A major facet of the School of Medicine's Strategic Plan, ***Translating Discoveries***, is medical student education. During the past five years, Dr. Julie Parsonnet, Senior Associate Dean for Medical Education and Student Affairs and the George DeForest Barnett Professor in Medicine (Infectious Diseases) and in Health Research and Policy, has led a major revision of the medical education curriculum in collaboration with the Medical School Faculty Senate as well as a number of faculty, students and staff. The New Curriculum, which was introduced in the Fall of 2003, represents a very significant demonstration of our commitment to educate and train future leaders, scholars and clinicians. Of course this curriculum is organic, and it continues to evolve as new and exciting changes are introduced. Nevertheless major accomplishments have already taken place, and I credit and thank Dr. Parsonnet for her impressive and significant leadership in bringing them to fruition. She has committed enormous energy and time into this effort, with considerable professional and personal sacrifice. Her efforts have moved Stanford down an important and enduring path – for which we are all grateful and appreciative.

Since she assumed the responsibilities of Senior Associate Dean for Medical Education, Dr. Parsonnet has spent more than 50% of her time on decanal functions. Concurrently she also continued her roles as a highly regarded physician-scientist, educator and clinician. Keeping all these balls in the air is enormously challenging and, understandably, the balance among them needs to change over time. In order to devote more time to her research program, Dr. Parsonnet has decided that it is time to relinquish her decanal responsibilities, and she will do so at the end of this calendar year. Needless to say, Dr. Parsonnet has set a high standard of accomplishment, and I am deeply appreciative of her efforts. Please join me in thanking her for making such outstanding contributions to Stanford.

In anticipation of Dr. Parsonnet's transition, I have spent the last several months reflecting on our current and future challenges in education in three major areas. First, we need to continue to refine and further develop our education program for undergraduate medical students by building on the New Curriculum and finding ways to take it to the next level. Second, we need to have a greater focus on graduate student education, especially in light of the recent Presidential Commission on Graduate Education and the special opportunities for interdisciplinary and interschool programs that now exist and that will further develop at Stanford. Third, we need more focused effort on Graduate Medical Education, including residents as well as clinical and research post-doctoral fellows. Based on these opportunities, needs and challenges I am pleased to appoint three new Senior Associate Deans who will help lead these future efforts.

First, Dr. Charles Prober, Professor of Pediatrics, Microbiology and Immunology, will succeed Dr. Parsonnet as the Senior Associate Dean for Medical Education on January 1, 2007. Dr. Prober, the recipient of numerous teaching awards, has been highly regarded

for his passion and commitment to education, both in the department of Pediatrics (where he has long-served as Associate Chair (Education) and in the School, where he has developed the PRECEPT program, led the highly regarded and well-subscribed "Scholarly Concentration" on Clinical Research, and initiated a pediatric physical findings course for preclinical students. Dr. Prober is respected by students, trainees and his colleagues throughout the university and beyond. I am extremely pleased that he has agreed to lead this important effort in medical education. Concurrently, Dr. Prober is serving as a co-principal investigator for our forthcoming CTSA (Clinical and Translational Research Award) to the NIH, focusing particularly on education and training- thus making his leadership in this area both consonant and coordinated.

Second, I am pleased to announce that Dr. John Pringle, Professor of Genetics, has agreed to become Senior Associate Dean for Graduate Education and Postdoctoral Affairs. Dr. Pringle joined Stanford approximately a year ago, when he arrived from the University of North Carolina with his wife, Dr. Bev Mitchell, who became the Deputy Director of the Stanford Cancer Center. Dr. Pringle also has a long record of commitment to education and was recommended with great enthusiasm by the basic science chairs for this important position. Dr. Pringle will plan to spend approximately 20% of his time and will focus on working with departments and IDPs on developing and implementing education, research, and mentoring programs for graduate students. In addition to graduate students, Dr. Pringle will also have responsibility for better integrating and coordinating postdoctoral programs. Without question, postdoctoral fellows are a valued and important part of our community, but they can often be somewhat disenfranchised, since they do not have a common home or shared experiences. Hopefully these challenges will be better addressed under Dr. Pringle's leadership.

Third, I will soon be announcing the individual who will serve in the newly created position of Senior Associate Dean of Graduate Medical Education. In nearly every academic medical center, including Stanford, there is a lack of connection between medical student education and graduate medical education. The former is the province of the school at the central, decanal level, while the latter is the province of its clinical departments. While we certainly want to respect, value and sustain the important role that the clinical departments play in resident and clinical fellow education and training, it is also important to recognize the lack of linearity and integration of medical and scientific education in academic medical centers. Often the important role of residents and clinical fellows as teachers (and learners) and researchers gives way to the demands of patient care and limitations in time. Our goal is to better bridge the connections between undergraduate and graduate medical education so that we can be even more successful in training and developing a cadre of clinical and translational investigators as well as outstanding physicians.

In their respective roles, Drs. Prober, Pringle and our soon to be named Senior Associate Dean for Graduate Medical Education will work closely together to assure the excellence and better integration of our programs in medical and graduate student education with those in graduate medical and postdoctoral training. It is my hope that this coordinated approach will create new opportunities for a future generation of Stanford leaders.

The Department of Molecular Pharmacology Becomes the Department of Chemical and Systems Biology

I am happy to report that the Department of Molecular Pharmacology has received permission from the Provost to change its name to the Department of Chemical and Systems Biology. The new name more accurately describes the research interests and aspirations of the Department and will help nucleate scholarly efforts in the important emerging fields of chemical biology and systems biology.

Dr. James Farrell, Chair of the Department, explains, “The term chemical biology has come to mean the use of organic synthesis and other chemical approaches to invent and develop biological probes and perturbants. Chemical biology is an exciting field. There are numerous new international conferences and journals devoted to chemical biology. ...Systems biology is another important emerging field. Over the past two decades much has been learned about the identities of the components of cells—genes, RNA species, proteins—and about which individual components are important for functions like cell growth, differentiation, and movement. Systems biology attempts to design principles of the networks composed of these genes, RNA species, and proteins. The key approaches include mathematical modeling and quantitative experimental approaches. In addition, there is a powerful potential synergy between chemical biology and systems biology. Chemical biologists produce the probes and perturbants required for the types of experiments that systems biologists need to carry out. In return, systems biologists provide the applications for these probes and the impetus for the development of new ones.”

I look forward to seeing the synthesis that is poised to occur between two exciting and emerging scientific fields in the Department of Chemical and Systems Biology.

The AAMC Grapples with Defining the Big Issues Facing Our Society and Academic Medicine

To help guide the direction of the Association of American Medical Colleges (AAMC), newly appointed President Darrell Kirsch has initiated an assessment of trends and challenges in society and medicine that will impact the AAMC – as well as the future of academic medicine. During the past several months he has asked members of the leadership boards of the AAMC to list some of the major trends and challenges they see. At the Administrative Board Meeting in Washington, D.C. on September 27-28th we participated in small and large group discussions of these trends, adding our views of their potential impacts as well as possible solutions. I serve on the Board for the Council of Deans. Since this is a work in progress I will refrain from sharing the in-depth discussion at this point – but I thought it would be of interest to list some of the major challenges and issues that have been identified to date. They are not likely to surprise you but I am sure you will appreciate that when taken together or in selected aggregates they present some very formidable issues that will likely impact how we carry out our missions in the years ahead. Here is the list in rank order of both likelihood and importance:

Trends in Society

- The number of Americans without adequate health insurance continues to rise.
- Access to information, education, and advice through Internet technologies becomes more commonplace.
- Effects of an aging population grow more acute.
- Direct-to-consumer advertising and marketing continues.
- Disparity of economic classes deepens.
- The trend for transparency and accountability in corporate and nonprofit governance and operations increases.
- Public skepticism increases and public trust in social institutions declines.
- Political party majorities in either house of Congress and/or in the Presidency change.
- The effects of cultural and ethnic diversity grow more acute.
- The interest of the public to tax itself to fund public goods declines.
- Economic globalization - with historically underdeveloped countries increasingly competing with the US – threatens America's dominance.
- An anti-science sentiment among public and policy-makers increases.
- Litigiousness of society increases.
- Terrorism or natural disaster within the US becomes more pervasive.
- There is a generational transfer of discretionary wealth of baby boomers.

Trends in Medicine

- The number of osteopathic and offshore medical schools and physicians increases.
- Health care costs continue to rise.
- The need to manage chronic diseases increases.
- The ability to cross-subsidize education and research missions is reduced.
- The number of non-physician healthcare providers increases.
- Demands increase to demonstrate quality in health care.
- Medical school tuition increases.
- Disparities in healthcare grow more acute.
- Demand for interdisciplinary healthcare teams grows.
- Federal appropriations for research and training are reduced.
- Reimbursement for physicians and hospitals declines.
- There will be worsening physician workforce shortages.
- Overload of information available to healthcare providers is commonplace.
- Sub-specialization in medicine increases.
- The shift to outpatient/ambulatory medicine, as well as hospitals, increases.
- The use and cost of new medical technologies increases.
- The profile of new physicians (e.g., lifestyle preference, greater percentage of women, etc.) continues to change.
- The application of genomics/molecular biology to treatment and prevention of disease increases.

- Conflicts of interest in biomedical research and in all levels of medical education are commonplace.
- The use of electronic medical records is commonplace.
- There are generational gaps of physician knowledge.
- Health care and medicine become globalized.
- New infectious diseases emerge.
- The interest of community physicians in participating in medical education declines.
- Litigation and legal issues in medicine increase.
- “Regionalization” of providing complex medical services increases.
- Resident duty hours will be reduced.

Because these trends represent input from leaders from deans of medical schools, CEOs of teaching hospitals, and leaders in medical specialties, among others, it is not surprising that these lists are so variegated in their priorities. Depending on one’s perspectives, these trends could be differently ranked or some elements added (or perhaps even deleted). Nonetheless I thought it would be of interest to you to take note of what some of our leaders in academic medicine see as the major challenges and issues for the years ahead. It seems likely that a number of these trends will become realities in the years ahead and that, as a consequence, the world of medicine as we know it today will be changed. Clearly anticipating these trends, understanding their complexity and planning how to address or respond to them will be key to a successful future. While organizations like the AAMC should be part of this effort, so should each of our medical centers and, in fact, each of you, if we are sustain the excellence of academic medicine, for both our individual and our collective futures.

Epic Opportunities

In the last issue of the Dean’s Newsletter (see: <http://deansnewsletter.stanford.edu/#7>) I commented on the progress that Stanford Hospital and Clinics is making in beginning to implement the Epic Information System. If you were unable to get to any of the demonstrations held in late September, several of the modules are available on-line. If you would like more information please go to: <http://clinicalinformatics.stanford.edu/stanford-ehr/epic/demos/>. During the months ahead SHC will begin a number of training modules, since it is clear that making the future electronic medical record successful will require significant education and training by all users. So you may wish to begin that learning process now.\

More About Academia-Industry Relations

On Saturday, October 7th I participated in a panel discussion on “Research: Leading or Coexisting in a New System?” at the annual meeting of the Association of Academic Health Centers. The other participants included Jennifer Washburn, Fellow at the New America Foundation and author of *University Inc.*, and Shannon Brownlee, Bernard-Schwartz Senior Fellow, New America Foundation. Each presented a similar perspective, which is that virtually all financial interactions of academic institutions and faculty with industry (at least as related to clinical research) should be severed. Their basic tenet was that conflict of interests can not be managed and that financial enticements ultimately

bias the quality of the research as well as the conclusions drawn by faculty – even if they profess being objective and declare any financial holdings.

Among the factors leading Washburn and Brownlee to these conclusions is the assertion that industry currently funds 70% of clinical trials in the US and that these trials are inherently biased to yield results that will increase market share and financial holdings. They further argue that most clinical trials are written by industry and that the data are analyzed by industry without objective oversight by faculty members who may be listed as the principal investigator(s). Further, they contend that many faculty who profess to be thought leaders ultimately become influenced by financial awards and incentives and lose their objectivity – even publishing papers that have been written by industry (so-called ghost writing). At the extreme, they argue that since conflicts of interest cannot be managed they must be avoided – especially if further loss of public trust is to be avoided. They proposed that a case should be made to the federal government to increase its support of clinical research to replace the funds provided by industry so as to provide a more objective clinical trials portfolio.

In my presentation I reviewed the changes that have occurred in medical schools and academic medical centers and in industry during the past century. I discussed why productive and collaborative ties with industry are necessary if discoveries made in our universities and medical schools are to become available to the public and increase the public good. I gave examples of how basic discoveries in genetic engineering stimulated the development of biotechnology and how this has fostered considerable public good. Further, I illustrated how the Bayh-Dole act of 1980 catalyzed the application of fundamental discoveries to products that improved our nation. At the same time, I acknowledged that a number of academia-industry relations have become too intermingled and that a number of them have threatened the public trust.

For example, I fully agree that clinical trials should be performed with independent oversight by academic faculty and that principal investigators have the obligation to have access to all data, to analyze and present the results – both positive and negative. They should never simply accept an analysis done by industry or permit their name to be associated with a publication they neither wrote nor contributed to. I further noted that faculty have an obligation to reveal in a transparent way any potential conflicts in scientific publications. In addition, they should never engage in the selective reporting of data of the type that has recently come to light with studies of Cox-2 inhibitors. In fact, the issue of clinical trials reporting is an area I worked on intently through the Health Science Policy Board of the Institute of Medicine (see http://deansnewsletter.stanford.edu/archive/05_16_05.html#1).

I also pointed out how and why academic medical centers like Stanford work diligently to bring discoveries to the public good by managed interactions with industry partners. I differentiated between the academic-industry relations that occur in research versus those that take place around marketing. The former helps to promote the public good while the latter can confound public perception or even squander public trust. I took issue with the suggestion that conflicts of interest could not be managed and further noted that potential

conflicts were much broader than simply financial and that it was pollyannaish to suggest that we could simply eliminate conflicts. Accordingly I pointed out how our research conflict of interest policies addressed these concerns and provided a credible path to managing potential conflicts. At the same time, I also pointed out the new policies we have recently introduced at Stanford to dissociate our students, faculty and staff from marketing activities – or from becoming industry marketers – by the strict limits we have set on gifts, meals, etc (see <http://med.stanford.edu/coi/siip/>).

While I acknowledge that there are important interactions between industry and academia that I would like to see fostered, I also recognize that there is a rising chorus of concern from the media and from various public interest groups about such interactions. As is often the case this can lead to a march toward the extreme. Clearly this is not desirable. But I do worry that if we are unable to appropriately monitor and manage industry-academia interactions in a way that is above reproach, outside regulation will likely ensue. From my perspective, such regulation would almost certainly stifle innovation and discovery and would not serve the public good. And while I believe that the policies we have in place adequately address the important issues surrounding academia-industry interactions, I am also cognizant that it is incumbent on each of us to assure that we are scrupulous in accurately reporting potential conflicts, both annually and transactionally, and that we work collaboratively with the School's Conflict of Interest Office and Committee. Failure to do so could not only impact individuals but could also result in wide-sweeping changes and rules with serious consequences for our entire community.

I would encourage each faculty member to become fully aware of our Stanford policies (see <http://med.stanford.edu/coi/>) and if you have any questions to direct them to Barbara Flynn (bflynn@stanford.edu), Dr Harry Greenberg (harry.greenberg@stanford.edu) or, if your question concerns the new Stanford Industry Interactions Policy, to our SIIP helpline: 650-724-1592 or Email: MedIndustryPolicy@stanford.edu.

UNA Conference at School of Medicine

On Saturday, October 7th, the School of Medicine co-sponsored with the Northern California Division of the United Nations Association a conference entitled, "Can the UN Heal the World?" Among the speakers were Congresswoman Anna Eshoo; Mandeep Bains, Policy Director for the United Nations' Millennium Campaign; and four of our faculty, Drs. Gary Schoolnik, Professor of Medicine (Infectious Diseases) and of Microbiology and Immunology and Senior Fellow at the Woods Institute for the Environment; Jonathan Berek, Professor and Chair, of Obstetrics and Gynecology and Gynecology; Bonnie Maldonado, Associate Professor of Pediatrics (Infectious Diseases), and by courtesy, of Health Research and Policy; and Paul Wise, Richard E. Behrman Professor in Child Health. The framework for the conference was the set of Millennium Development Goals (MDGs) agreed to in 2000 by all the member states of the UN. The MDGs lay out measurable goals and timetables for addressing the world's most pressing problems by the year 2015. Specifically, the MDGs aim to:

- Eradicate extreme poverty and hunger

- Achieve universal primary education
- Promote gender equality and empower women
- Reduce child mortality
- Improve maternal health
- Combat HIV/AIDS, malaria and other diseases
- Ensure environmental sustainability
- Develop a global partnership for development

Ms. Bains provided an update on these efforts. Although progress is being made in some areas and on some of the goals, the data show that, overall, many of the goals are not on track and that Sub-Sahara Africa in particular is not on track to meet the goals in any of the areas. Drs. Berek, Maldonado and Wise, in a panel moderated by Dr. Schoolnik, provided more detailed information in such areas as women's health, maternal-infant health, and infectious diseases that supported this sober assessment. As Ms. Bains put it, "The promise made to the world's poor is not being kept."

The irony – and the hope – in this state of affairs is that the goals articulated in the MDGs are achievable. We have the resources, the expertise, and the time to achieve them, and Dr. Wise provided inspiring examples of activities in Haiti and Guatemala that are successfully working to save lives and rebuild communities. However, what is needed on a global scale is the political will to allocate the resources it will take to achieve the goals. The wealthier nations need to provide aid, training opportunities, and debt forgiveness to the poorer nations. For instance, in 1970, 35 of the wealthier nations committed to allocate 0.7% of their Gross Domestic Income (GDI) towards these types of efforts. Regrettably, 35 years later, only five countries have met this obligation. As for the United States, we did not even make that commitment in 1970. In 2005 we provided 0.22% of our GDI, far from the average effort of rich countries, which is 0.47%. In fact, we are the second lowest of 22 wealthier countries – only Portugal is behind us.

What can we do? Congresswomen Eshoo encouraged the conference attendees to be active citizens; be aware of what Congress is doing in these areas; and try and get national government policies and programs changed. She pointed out that Congress responds to pressure – and she urged us to exert that pressure! We can also become informed about the millennium goals and about what each of us can do to help at www.millenniumcampaign.org.

Thanks to Drs. Berek, Maldonado, Schoolnik and Wise for their participation in this very worthwhile conference.

Dr. David Stevenson Gets a "Perfect 10" in His Apgar score

Also on Saturday, October 7th, Dr. David Stevenson became the youngest winner of the Virginia Apgar Award. This award is given annually by the Section on Perinatal Pediatrics of the American Academy of Pediatrics "to an individual whose career has had a continuing influence on the well-being of newborn infants." Dr. Stevenson, who serves as the Vice Dean and Senior Associate Dean for Academic Affairs and Harold K. Faber

Professor of Pediatrics and Professor, by courtesy, of Obstetrics and Gynecology, joins Professor Emeritus Philip Sunshine, who won the Apgar Award in 2001, in receiving this prestigious honor.

While Dr. Apgar (1909-1974) is perhaps best known for the Apgar score – a system for assessing the physical condition of a newborn at one minute and five minutes after birth – she was also a “renaissance woman” with a wide array of talents and accomplishments in medicine, science, the arts and beyond. The award honoring her name and many contributions has been given annually since 1975, and its recipients include luminaries in pediatrics and neonatology. There is no question that Dr. Stevenson is eminently qualified to join this list – and by doing so brings honor to himself, his many collaborators throughout Stanford, and the field of pediatrics.

Please join me in congratulating Dr. Stevenson.

Honoring Dr. Harvey Cohen

After thirteen years of wonderful leadership, Dr. Harvey Cohen, the Arline and Pete Harman Professor for the Chair of the Department of Pediatrics, will be stepping down as Chair of the Department of Pediatrics at the end of this calendar year. Under his leadership both the department and child health have been transformed at Stanford and in our community. During his tenure Dr. Cohen has, in many ways, become the face of pediatrics, and his caring manner, compassion and commitment to the well-being of children in this community and beyond are deeply valued and highly respected. He has played a critical role in the recruitment of outstanding faculty leaders throughout the department and has played an important role in the training and education of a generation of pediatric housestaff and fellows. Under Dr. Cohen’s leadership the Lucile Packard Children’s Hospital (LPCCH) was born in its current physical incarnation, and because of his efforts and those of his colleagues it has achieved national pre-eminence. Among his greatest gifts and contributions has been his ability to engage community leaders to support LPCCH, which is perhaps best evidenced by the Children’s Health Initiative supported jointly by the David and Lucile Packard Foundation and contributions from the community garnered through the efforts of the Lucile Packard Foundation for Children’s Health.

Over the last few months there has been a plethora of events to celebrate Harvey Cohen’s contributions – the latest from the Department of Pediatrics. In each of these events– and those still to come – his humanism, care and commitment to children and to advancing knowledge to improve future generations has been highly praised – and for very good reason.

I have had the privilege of knowing Dr. Cohen for some 36 years, since we began our training together as interns at the Children’s Hospital Boston in 1970. His commitment to science and its relevance to the care of children was evident from our first encounters – and it has certainly endured over the decades. So too has his exuberance and personal warmth. For those of you who know Dr. Cohen, you will recognize that he is renowned for his bear hugs and warm embraces. Of course, these are less intimidating now that he

has assumed a more grandfatherly manner – compared, of course, to when he was a much younger guy with big sideburns and a mustache! In addition to his scientific prowess and his commitment to pediatrics, Dr. Cohen is also much admired by his family. He and his wife Ilene of 40 years are best friends, and they have raised two wonderful sons, who admire them and who have brought joy and grandchildren into their lives.

Transitions are a part of academic life – and certainly of senior leadership. The role of department chair is a demanding one that requires enormous energy and commitment. It is also a role that benefits from renewal –for both the individual and the institution. Clearly Dr. Cohen has worked diligently to serve the department of Pediatrics, the Lucile Packard Children’s Hospital, the School of Medicine and Stanford University with great success, for which we are deeply appreciative. By handing over the reins at this juncture Dr. Cohen leaves a legacy of accomplishment as well as the opportunity for another chapter to be opened in the life of LPCH and Stanford – and for his own self-renewal.

Thankfully, Dr. Cohen will remain an active member of our Stanford community. He recently received the excellent news that his NIH grant application will be funded, and he will begin a sabbatical with Professors Dick Zare and Rob Tibshirani. He has also announced that he will be retooling to participate in his clinical area of pediatric hematology-oncology. In all of his new endeavors I am confident that Dr. Cohen will continue to enrich our community. And of course, we all continue to benefit from his personal warmth – including his greetings and hugs. Thanks, Harvey, for all that you have accomplished – and best wishes for the exciting times that lie ahead!

Awards and Honors

The Mason Case Fellows for 2006-1007

The School of Medicine and the Office of Graduate Education/Biosciences are pleased to announce the selection of the first two Mason Case Fellows. These awards are made possible by a generous donation from Mr. Mason Case, Stanford alumnus. The first two Mason Case Fellows are:

- **Maria Vaysberg**, a Ph.D. candidate in Immunology, is analyzing the contribution of the Epstein Barr Virus (EBV) latent gene LMP1 to the Jak/STAT pathway and IL-10 signaling in B cell lymphomas. Born in Moscow, Maria graduated from UC Berkeley with honors in molecular biology and distinction in scholarship. Her thesis research is conducted in the laboratory of Professor Olivia Martinez (of the Department of Surgery and the Program in Immunology). Maria’s research has been published in the American Journal of Transplantation, Nature and Science. In addition to her thesis research, Maria is recognized for excellence in teaching in the Advanced Immunology Course, particularly for her teaching of B cell development.
- **Amanda Mikels**, is conducting her doctoral research in Cancer Biology and Developmental Biology in the laboratory of Professor Roel Nusse, HHMI Investigator and Professor of Developmental Biology. Prior to her

entry into Stanford's Ph.D. program, she graduated with honors from the University of California at San Diego with a degree in Microbiology, where she was elected to Phi Beta Kappa and received the outstanding achievement award in Microbiology. At Stanford, Amanda has selected a highly ambitious research project to understand how the ligand Wnt 5a affects cell proliferation. Her research is relevant to the spectrum of normal developmental events and disease mechanisms where the Wnt pathway plays essential roles. Amanda's research has been published in Stem Cells and Development and in PLOS Biology. Professor Nusse credits her for great intellectual curiosity, enormous persistence in experimental work and great insight. Amanda is also a dedicated and gifted teacher, making important contributions to Cancer Biology 241 and to Cancer Biology 280.

James Chang, Chief of the Division of Plastic and Reconstructive Surgery and Associate Professor of Surgery (Plastic Surgery) and Orthopedic Surgery (Courtesy), has been awarded the American Society for Surgery of the Hand Sterling Bunnell Traveling Fellowship in Hand Surgery for 2006-2007. The award funds foreign and domestic travel to pursue investigation into one specific area of research related to hand surgery. Congratulations, Dr. Chang.

Mark Davis, Burt and Marion Avery Professor in Immunology, has been selected as the Ellison Medical Foundation Senior Scholar in Aging. Congratulations, Dr. Davis.

S.V. Mahadevan, Assistant Professor of Surgery and Associate Chief, Emergency Medicine, and Medical Director of Stanford University Emergency Department, is the co-editor of *An Introduction to Clinical Emergency Medicine*, which was recently named American Medical Writers Association 2006 Book Award Winner: Physician's Category. The textbook, apart from being used at Stanford, is also being utilized as the core textbook for emergency medicine courses around the country. Congratulations, Dr. Mahadevan.

Upcoming Events

5th Annual Fall Forum on Community Health & Public Safety

Tuesday, October 17th
5:30 - 7:30pm
Frances C. Arrillaga Alumni Center
326 Galvez Street, Stanford University

Please mark your calendar and plan to join us as we celebrate student contributions to community health through public service and community partnership research.

Keynote address by Barbara Stagg, MD, co-founder and co-director of FACES

for the Future Program. A leader in adolescent medicine and a national authority on high-risk youth, urban and minority youth, violence, and healthcare concerns for multicultural societies, Dr. Barbara Staggers is division chief of Adolescent Medicine at Children's Hospital & Research Center at Oakland.

<http://facesforthefuture.org/staggers.htm>

This event, organized by Stanford Medical Students and sponsored by the Office of Community Health, is free of charge and open to the public. If you will be attending, please RSVP to fallforum2006@yahoo.com to assist us in our planning. **Questions?** Please contact the Fall Forum Coordinators Sravi Chennupati schrenn@stanford.edu and Eugene Yim eugene.yim@stanford.edu

16th Annual Jonathan J. King Lecture

On Wednesday October 18th, Harold Freeman, MD, President and Medical Director of the Ralph Lauren Center, will give the 16th Annual Jonathan J. King Lecture for Cancer Care and Prevention. He will address Poverty, Culture and Social Injustice: Determinants of Health Disparities. The lecture will be held at 5 pm in the Lucile Packard Children's Hospital Auditorium. For additional information, call the Center for Biomedical Ethics at 650-723-5760.

Appointments and Promotions

Rishad Faruq, MBBS has been appointed to Clinical Assistant Professor (Affiliated) in the Department of Surgery, effective 10/1/06.

Neil Gesundheit has been appointed to Associate Professor of Medicine, effective 10/1/06.

Beatrice Jenny Kiratli has been appointed to Clinical Assistant Professor (Affiliated) in the Department of Medicine, effective 10/1/06.

Dean's Newsletter October 23, 2006

The Stanford Challenge

On Tuesday, October 10th, following six years of planning, President John Hennessy and the University Trustees officially launched the Stanford Challenge. In his communication, "Seeking Solutions, Educating Leaders," President Hennessy observes, *"Today the scale and complexity of the challenges around the world are unprecedented. Globalization means that the problems of different societies are increasingly shared, whether the issue is the environment, human health, or a threat to peace and security..."*

At the same time as we face these formidable problems, new discoveries and inventions are providing us with incredible opportunities for progress. As creators of knowledge and as educators who will produce the next generation of leaders, universities can play a critical role in helping our global community address these issues. Stanford in particular has the opportunity to be at the forefront in this search for knowledge and solutions, as well as in the education of leaders who are equipped for the challenges ahead. This is our mission."

While most universities take on capital campaigns with inward looking goals, Stanford is taking the bolder view of asking what it can do to address some of the world's greatest problems and challenges. The Stanford Challenge is committed to seeking solutions to challenges in human health, energy and the environment, and important international issues. In doing so, faculty and students from all disciplines of the University will look for new alignments and opportunities to work interactively and collaboratively in novel and compelling ways – and to truly make a difference for the 21st century.

In tandem with the broader University's planning efforts, the School of Medicine's Strategic Plan, ***Translating Discoveries***, has been similarly outwardly focused. We seek solutions to large and complex challenges to human health through the university-wide interdisciplinary initiatives of our Stanford Institutes of Translational Medicine and through the education of future leaders. Our New Stanford Curriculum for medical students and our focus on the training and development of physician-scientists and scholars throughout their training aim to provide the knowledge, skills and commitment to the leadership in the biosciences that will be needed if we are to solve these challenges.

The launch of the Stanford Challenge followed the remarkable week in which two Stanford faculty, Professors Andy Fire and Roger Kornberg, were awarded Nobel Prizes in Medicine and Chemistry respectively (see <http://mednews.stanford.edu/kornberg/place.html>). Without question, seeking solutions requires a firm foundation in fundamental discovery and innovation – an area in which Stanford faculty truly excel (see <http://deansnewsletter.stanford.edu/>). But to actually advance discoveries to serve the public good, a commitment to fostering broad interactions and then translating innovations and discoveries to our communities locally and globally must be actively pursued. Some of these issues were discussed in a roundtable discussion entitled ***Anxious Times. Seeing Beyond a World of Perpetual Threats*** held on Saturday, October 14th and which included a number of national leaders including Dr. Lucy Shapiro, the Virginia and DK Ludwig Professor and Director of the Beckman Center (to see the roundtable go to: <http://news-service.stanford.edu/news/2006/october18/roundnew-101806.html>).

As part of the launch of the Stanford Challenge events were held not only at Stanford, but also in Los Angeles and New York City, to inform alumni and friends about the new goals and objectives of Stanford for the 21st century. I had the opportunity to speak at the New York event, which was held in the newly renovated Morgan Library on Tuesday evening, October 17th. In my presentation I pointed out how our current interdisciplinary efforts are in many ways built on the long history of collaboration and interaction among

faculty at Stanford. For example, the development of the Cyberknife, which is now widely used to selectively treat cancer, is the result of collaboration between faculty in neurosurgery and computer science and is a derivative of the pioneering collaborations of nearly half a century ago that led faculty in medicine and physics to pioneer the linear accelerator. In fact, the elegant work of Professor Roger Kornberg directly benefited from similar interactions between the School of Medicine and the Stanford Synchrotron Radiation Laboratory. There are many examples of such interdisciplinary collaborations and interactions – and they all point to how Stanford utilizes skills from different disciplines to find novel solutions.

In addition to challenges in human health, Stanford faculty are seeking solutions to important environmental problems. Among these, finding and providing clean water has tremendous importance. Recently, Stanford faculty from disciplines including infectious diseases, genetics, and optics have developed a detection system to determine whether water is clean or contaminated based on molecular signal changes in living bacteria. Such novel technologies can have worldwide impact. Another approach for seeking solutions is demonstrated by the Summer Fellows Program, which brings leaders from countries like Iraq, Afghanistan, China, and Russia together at Stanford for a three- week program. While here they engage in interaction and discussion about political, economic and social change with faculty leaders from across university – including business, education, political science, law, sociology.

While many universities are now touting a commitment to interdisciplinary research and education, for many it will be only rhetoric. However, Stanford has all the ingredients to be a true leader and pioneer because of its outstanding faculty and students and also because of the physical connectedness of the University's seven schools. This proximity is truly an essential component and a great advantage. It also likely explains the long history of Stanford's cross-school collaborations, which have occurred over decades. Coupled with the vision and support of the University leadership we clearly have the essential ingredients to be a true leader.

While these ingredients are essential it is also important to help foster innovation, discovery and collaboration. Here too Stanford has excelled. For example, Innovation Awards through Bio-X have helped stimulate novel interactions among faculty from different schools. The Translational Medicine Awards co-sponsored by the Dean's Office and the Beckman Center have stimulated exciting new collaborations among basic and clinical faculty – both in the School of Medicine and with colleagues in other schools. Similarly the new Woods Institute for the Environment is providing seed funding for novel interdisciplinary collaborations such as the clean water project I mentioned earlier. The Freeman Spogli Institute for International Studies is also supporting novel collaborations to foster interdisciplinary and interschool research and education.

Support for graduate education is also essential to foster novel ways to seek solutions. An essential component of the Stanford Challenge will be graduate fellowships that will build on the current Stanford Graduate Fellows (SGF) program. This program will also be expanded beyond the physical and life sciences to include the humanities and social

sciences. In addition joint faculty appointments among different schools will play a key role in enhancing interactions among faculty. The recent appointment of a faculty member jointly appointed in the Law School and in International Studies is one such example. Closer to home, the joint appointment of a new faculty member in Developmental Biology and Computer Sciences is yet another way of drawing schools and disciplines closer together. Of course this type of synergy is already epitomized by the interactions taking place among the highly diverse faculty in the Clark Center as well as the faculty who are participating in the Stanford Institutes of Translational Medicine. Each of these programs is devoted to facilitating and promoting interaction, collaboration, and fostering discovery and innovation that can help seek solutions to important global challenges.

Our efforts in interdisciplinary research and education are clearly building on the past as well as helping to create the future. The numbers of interdisciplinary interactions already in operation provides clear evidence that we are well on our way to making this vision a reality. The fact that investments in seeding novel interactions can have a tenfold yield in fostering new sponsored research grant applications is also extremely encouraging. What is also clear is that for Stanford this is not business as usual – these new ventures in seeking solutions to challenges in human health, sustaining the environment, and international issues are truly transformative and will define the Stanford of the 21st century.

In addition to these compelling challenges, Stanford is committed to reinventing graduate education, extending the renaissance in undergraduate education, and sustaining the foundations of excellence that make it such an exceptional university. Clearly exciting times – and challenges – lie ahead.

Health and the Environment

As an example of how the Stanford Challenge is fostering new opportunities and interactions, I had the opportunity on Friday, October 20th to attend a meeting of an Ad Hoc Committee chaired by Dr. Gary Schoolnik, Professor of Medicine and of Microbiology and Immunology and Senior Fellow at the Woods Institute for the Environment. This meeting brought together over 30 faculty and senior leaders from throughout the University, including Woods Institute Co-Directors Jeff Koseff and Buzz Thompson (see also <http://environment.stanford.edu/>). It was clear that there was a commitment to seek new alignments and solutions by crosscutting collaborations. While the areas for interaction will certainly evolve over time, several exciting themes were discussed, including studies of the interactions between genes, the environment and disease; the important challenge of emerging infections – which is certainly influenced by factors like climate change, population migration, and agriculture, among others; the challenge of clean water and health; and the transformative changes in human behavior that are needed to make progress. In addition to these and other areas of research collaboration, important opportunities in undergraduate and graduate education were also presented. Together, these ideas provide evidence of how new and novel interactions will

emerge when faculty from throughout the University engage in the Stanford Challenge of Seeking Solutions and Educating Leaders.

Seeking Balance

Like many of you, I have long been concerned about how we can achieve the dual goals of sustaining excellence and fostering an environment that respects work/ family balance. To this regard, at the Executive Committee meeting on Friday, October 20th, Senior Associate Deans Hannah Valentine and David Stevenson led a discussion about flexible work arrangements for faculty. While the focus was on the particular arrangements that are currently available at Stanford, it was clear from our discussion –and from our personal reflections - that this topic is much broader than these specifics.

Among the issues that surfaced was the fact that the arrangements and programs that are already available at Stanford are not as widely known among faculty as they might be. Therefore, I include them below for your information. Individual faculty who are interested in learning more about flexible work arrangements should contact Vice Dean and Senior Associate Dean for Academic Affairs David Stevenson at david.stevenson@stanford.edu.

Flexible Work Arrangements Currently Available at Stanford: Options for Faculty

- Part-time appointments, often for a fixed period of time, with the approval of the department chair and Vice Dean and Senior Associate Dean for Academic Affairs (individuals appointed at part-time accrue time toward the acquisition of tenure and toward sabbatical eligibility on a prorated basis);
- Extension of time in the assistant professor rank up to ten years, either on the basis of proration related to reduced FTE (temporarily or permanently) or leaves
- without salary permitted by existing policies;
- A reduction in teaching and/or clinical duties for one quarter for new birth or adoptive parents (this policy is not intended for parents whose newborn or newly adopted child is cared for more than half time by either a spouse/partner and/or a child-care provider);
- Within policy limits, a one-year tenure/promotion clock delay and corresponding appointment extension for faculty members who become a parent, by birth or adoption (faculty who request this extension are expected to have substantial and sustained childcare responsibilities);
- Leaves without salary of up to one year, at full or part-time, for any faculty member, male or female, who becomes a parent whether by birth or adoption, for the purpose of caring for the child;

- With the approval of the Provost, appointment extensions for extenuating circumstances, such as excessive, unanticipated clinical duties or other compromising exigencies.
- Over the course of the last few years, the University has focused attention on a variety of issues related to work-family policies and practices. The Provost's Office has published an informational brochure entitled "Family Matters @ Stanford – For Faculty," which highlights Stanford's commitment to faculty with families, from child-care and child-support programs to part-time employment options. This brochure may be downloaded at <http://facultydevelopment.stanford.edu/facultydevelopment.html>.

More broadly, members of the Executive Committee discussed the reticence that faculty, particularly women, might feel in taking advantage of these arrangements. Among the causes posited for this hesitance was a concern that those evaluating their performance for reappointment or promotion might view anything other than full-time effort in a negative manner – perhaps as a sign of weakness or lack of commitment. The chairs noted that such concerns, whether or not they are valid, reflect the academic culture and, in particular, the "evaluation milieu" in which faculty work. And because experts at other institutions evaluate faculty, the milieu - and the culture - are national in their influence and importance. While I understand those observations and concerns, I also strongly believe that it is incumbent on us to change them – and to develop a more supportive culture that fosters different trajectories for career development

While these issues are generic and affect all faculty, both men and women, they are particularly serious for clinical faculty, who work in an environment where the pressures to achieve in all three areas of endeavor – scholarship, teaching, and clinical care – are extremely high. This is further exacerbated by the policy that all assistant professors face an up-or-out decision. In addition, because of the exceedingly lengthy training periods in many medical specialties, for women faculty the promotion clock and the biological clock are frequently running simultaneously. The flexibility offered by some of the arrangements described above can be very helpful and should be viewed by all as available without stigma. I certainly view them as helpful tools for faculty to manage their careers and maintain work/life balance, and I encourage interested faculty to explore them as they fit their particular circumstances.

Moreover, it is becoming apparent that for young scientists and physician/scientists, both men and women, work/life balance is a significant, if not the most significant, factor in their considerations of career choices. We are already seeing a shift away from entrance into the surgical specialties in favor of such "life-style specialties" as dermatology, radiology, and emergency medicine for these reasons. Moreover, as the pressures mount to achieve success in all three academic missions, the demands of patient care generally trump pursuit of scholarship. As a result, individuals may leave academic medicine to go

to private practice. In short, we risk losing a whole generation of bright physician-scientists because the combination of professional pressures in academic medicine and family responsibilities becomes untenable. We must make renewed efforts to address this.

Members of the Executive Committee also discussed the challenges faced by residents and clinical fellows and made several suggestions for flexibility that we will be following up on. As the pipeline for academic medical faculty, how this group experiences their fellowship years obviously has a significant impact on the composition of the faculty in the future.

This is clearly a topic that deserves attention and focus. I am certainly interested in your thoughts about it as well. In any event, I will keep you apprised of our further discussions and actions in this area over the next months.

Ongoing Efforts to Reduce Trips

As you hopefully know by now, the School of Medicine has been very active in implementing both education and programs aimed at reducing peak-hour traffic. We have now completed Phase II our activities in this area. Ms. Julia Tussing, Managing Director for Finance and Administration, has prepared the following report on accomplishments to date:

The results indicate a tremendous effort on the part of managers and staff to reduce trips: if all staff are able to keep their commitments for trip reduction, there will be a 30% decrease in peak-hour trips. This would be an extraordinary result, and although there is no way to verify exactly what the effect has been so far on the General Use Permit (GUP) survey of our trips to campus (since the counts cannot done school by school), the results in terms of reduced traffic, positive impact on the environment—our “carbon footprint”—and healthier work and life balance for employees would be outstanding.

Based on results for 1750 staff, who in the Phase II process met with their supervisors to explore options and decide on new commute methods or work plans, approximately 65% initially drove alone to work. This number was reduced to 60% in Phase II, which means that 84 people have changed their primary means of transportation from driving alone to an alternative method: biking, public transportation, etc. As a whole, anticipated weekly trips were reduced from 5200 to 3650, or by 1550 trips. Much of this reduction was the result of changed schedules: about 10% of campus employees reported a change in their work schedule that reduced trips. Almost 100 people also now telecommute at least one day a week.

Departments that were doing an excellent job even before Phase II included Medicine’s Division of Nephrology (6 people created only 2 trips per week),

Microbiology & Immunology (32 people created only 13% of their total possible trips), Biochemistry (29 people created 17% of total possible trips) and Anesthesia (48 people created 22% of total possible trips). Anesthesia also was near the top in trips reduced in Phase II at 54%, which is a stunning result given that they were also initially such good commuters! I am pleased to say that the Dean's Suite staff reduced trips by 56%, and the Department of Medicine divisions of Oncology and Hematology, as well as the Office of Student Affairs, were close behind.

The efforts made by members of the School of Medicine and the rest of the campus community has made a noticeable difference in peak hour trip levels. If the trends observed in the spring traffic study continue, the campus will meet the goal of no net new peak hour trips. However, it is crucial that each of us continues to honor our Phase II commitment. If use of alternative transportation is not an option every day, try it at least once or twice a week. Every trip counts! P&TS continues to offer commute trip planning to assist commuters in identifying alternatives to driving. Everyone is encouraged to visit the P&TS website and use the Commute Cost and Carbon Emissions Calculator (http://transportation.stanford.edu/alt_transportation/calculator.shtml) to calculate the financial and environmental benefits of alternative transportation. And, while at the website, please consider the benefits that go along with being a member of the Commute Club.

The next planned phase of trip reduction will be the introduction of incentive plans for departments and individuals. Incentive possibilities are now being explored by a small task force made up of Julia Tussing (Finance & Administration), Mary Bobel (Radiology), Jason Irwin (Otolaryngology), Norma Leavitt (Human Resources), Susie Mitchell (Microbiology and Immunology), Deirdre Rockefeller (Office of Student Affairs), Jane Rothstein (Health Improvement Program), and Phil Yamahiro (Dermatology and Ophthalmology).

I would also like to remind faculty and students that they can have a significant impact on trip reduction as well, while also benefiting the environment. I have been asked why faculty and students were not included in the Phase II program, and the answer is twofold: first, staff create by far the most trips, as they are both more numerous than faculty and students and often live farther away; and second, student and faculty hours may not be as flexible given class and clinical commitments. However, I would say to faculty and students that being aware of the issue and changing your habits to the extent possible will allow you to have an impact. The DFA of your department has information provided in the Phase II toolkit about alternative commute methods, and there are classes you can sign up for through the Health Improvement Program (Alternative Transportation for Health, Stepping Out) to help you start on a new program. We will be asking DFAs to keep faculty and students informed about these options.

Many thanks for all of your efforts in this undertaking!

Special Thanks to the Berry Foundation

On October 19-20th the Directors of the Berry Foundation made their annual – and most welcome – visit to Stanford. Since 1990 the Berry Foundation has provided nearly \$8M to support the training and research of fellows with a particular focus on child health. The Foundation is located in Colorado and is led by Walt Borneman, an attorney, outdoorsman, historian and author. Most importantly, Mr. Borneman and his colleagues have been amazingly committed to helping enhance and sustain excellent research and training at Stanford, and we are most appreciative of their support and confidence.

Thanking Denise O’Leary and Peter Bing

At the Stanford University Board of Trustees meeting on October 9-10th, two individuals, Ms. Denise O’Leary and Dr. Peter Bing, completed their terms and were honored by the Board and University for their leadership and service. I would like to add my personal thanks and appreciation to Denise and Pete – both of whom served on the Committee on the Medical Center, as well as the Boards of Directors for Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital. Their long-standing commitment and dedication to the School, Medical Center and University has been wonderful and much appreciated – particularly from the dark days of the 1990’s to the more optimistic ones of the past several years. Volunteers to the University and hospitals spend incredible amounts of personal time and effort to help support our missions and Denise and Peter have been truly remarkable. Please join me in thanking them.

Awards and Honors

We are pleased to announce that the **Amgen Foundation** has officially welcomed Stanford University as a site for the Amgen Scholars Program. Stanford University is one of 10 institutions selected as program sites – among them UC Berkeley, MIT and Columbia University – to promote strong scientific research experiences that can be pivotal in the life of an undergraduate.

Yakir Levin, a graduate student, is the recipient of an ARCS (Achievement Rewards for College Scientists) Award. The ARCS Foundation provides scholarships to academically outstanding United States citizens studying to complete their degrees in science, medicine and engineering, thereby contributing to the worldwide advancement of science and technology. Congratulations, Yakir.

Appointments and Promotions

Annelise E. Barron has been appointed to Associate Professor of Bioengineering, effective 12/1/06.

Gill Bejerano has been appointed to Assistant Professor of Developmental Biology and Computer Science, effective 1/1/2007.

Christie Coleman has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology effective 9/1/06.

Heidi Feldman has been appointed to Professor of Pediatrics (Neonatology) at the Lucile Salter Packard Children's Hospital, effective 10/1/06.

Henry Hsia has been appointed to Associate Professor of Medicine (Cardiovascular Medicine), effective 10/1/06.

James I. Huddleston has been appointed to Assistant Professor of Orthopaedic Surgery, effective 10/1/06.

Stefanie Jeffrey has been reappointed to Associate Professor of Surgery (General Surgery), effective 4/1/2007.

Todd Kaye has been promoted to Adjunct Clinical Assistant Professor of Medicine effective 9/1/06.

James Lock has been promoted to Professor of Psychiatry and Behavioral Sciences at SUMC and the Lucile Salter Packard Children's Hospital, effective 10/1/06.

Peter H. Lorenz has been promoted to Professor of Surgery, effective 10/1/06.

David Lyons has been reappointed to Associate Professor (Research) of Psychiatry and Behavioral Sciences, effective 10/1/06.

Phillip Ng has been promoted to Adjunct Clinical Assistant Professor of Medicine effective 9/1/06.

Anthony J. Ricci has been appointed to Associate Professor of Otolaryngology - Head & Neck Surgery and by courtesy, of Molecular and Cellular Physiology, effective 10/1/06.

Seung Kim has been promoted to Associate Professor of Developmental Biology and, by courtesy, of Medicine (Oncology), effective 10/1/06.

Iris Schrijver has been reappointed to Assistant Professor of Pathology and, by courtesy, of Pediatrics at the SUMC and at the Lucile Salter Packard Children's Hospital, effective 9/1/2006.

Barbara Sommer has been promoted to Associate Professor of Psychiatry and Behavioral Sciences, effective 10/1/06.

William Talbot has been promoted to Professor of Developmental Biology I, effective 10/1/06.

Winona Tan has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology effective 9/1/06.

Jamie Zeitzer has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 10/1/06.

Dean's Newsletter

November 6, 2006

Stem Cell Research Two Years Following Proposition 71

Election Day 2004 brought the exciting news that a majority of Californians had voted in favor of Proposition 71. This meant that approximately \$300 million dollars per year for 10 years would be used to fund stem cell research through a new entity, the California Institute for Regenerative Medicine (CIRM). Two days after the election I was appointed by Steve Westly, the State Controller, to serve on the Independent Citizens Oversight Committee (ICOC), the 29 member board that would oversee this exciting new initiative. The passage of Proposition 71 was especially welcome news since NIH funding for embryonic stem cell research had been severely limited and was restricted to the handful of cell lines that were on the list approved by President Bush in August 2001. Two years later, while much has changed in the world, support and funding for stem cell research in the United States remains severely constrained, and stem cell politics are again featuring prominently in the elections that will be held tomorrow, November 7th.

While virtually every poll of the public throughout the USA (including Texas) has demonstrated that the majority of American citizens support embryonic stem cell research, the ethical, moral and religious debate surrounding this issue continues unabated. Unfortunately the debate is often distorted by hyperbole and emotion rather than being based on facts and rational thinking. Indeed, a pivotal election in Missouri rests to a significant degree on stem cell politics (see Susan Okie, *Stem Cell Politics*, *NEJM*, 2006; 335: 1633-1642). Moreover, litigation in California brought by a minority of individuals challenging the constitutionality of Prop 71 has effectively blocked the state from issuing the voter approved bonds that would have funded stem cell research. It is widely anticipated that the lawsuits will be overturned in the Appellate Court and State Supreme Court by next summer. However, this delay still means that California, and as a consequence, the nation, will have lost three years of opportunity to train a cadre of future stem cell investigators and to develop the critical insights and discoveries necessary to move this exciting field forward. Moreover, it is clear that we are currently losing our global leadership role in stem cell research.

Despite these challenges I am quite optimistic for the future. During the past two years the ICOC and the CIRM have developed guidelines and infrastructure to critically review the best proposals for embryonic stem cell research and to assure that research in California is done with the highest integrity. Equally importantly, the CIRM has collaborated with leading scientists from around the world to develop an important strategic plan and agenda for stem cell research. And perhaps most importantly, thanks to private contributions to "bond advancement notes" and, more recently, the promise of

advance funding of \$150 million of bonds by Governor Arnold Schwarzenegger, we can now truly jump start the now all-too-delayed research programs. Indeed these funds might just bridge the gap until the lawsuits are fully dismissed and full funding of Prop 71 finally begins.

I am also highly encouraged by the number of Stanford faculty and students who have sustained or, more recently, defined their interests in stem cell research – and especially by those who have developed exciting “seed funding” grant proposals that were recently submitted to the CIRM for projects to commence, if funded, in 2007. While I fully recognize that this is still a nascent field, there is every reason to believe, based on work done to date and on the excellence of our faculty and Stanford’s Institute for Stem Cell Biology and Regenerative Medicine, that fundamental new knowledge in stem cell and developmental biology will ensue once the funding is available. I also believe that the insights that emerge will help spawn novel approaches to cell-based therapies that could significantly impact a number of chronic and debilitating diseases.

And finally I am also encouraged because tomorrow is Election Day – offering an opportunity for enlightened thinking about stem cell research as well as the many critical issues facing our nation and world to be turned into concrete actions and choices.

The Learning and Knowledge Center Prepares for 2009

In 1959 the Stanford University School of Medicine moved from San Francisco (where it had been since its founding in 1908) to the Stanford campus. This bold move catapulted Stanford into prominence as a leading research-intensive school of medicine. The vision for this move originated with President Wallace Sterling, Provost Fred Terman and Dean Robert Alway. It resulted not only in the recruitment of remarkable faculty but also in the laying of the foundations for the interdisciplinary research and education that we now celebrate and foster at Stanford. The original medical school facilities designed by architect ED Stone were built for \$21 million and were viewed as bold and novel by many of its first occupants. Over the ensuing years, the Stone buildings (comprised of the Gale, Alway, Lane and Edwards Buildings) became surrounded by new research facilities, including the Fairchild Science Building and Auditorium, the Beckman Center, Lucas Center, MSLS the Center for Clinical Research and the Clark Center. A number of smaller facilities such as the Redwood Building and the Pediatric Surgical Research Laboratory were also built. While these buildings provided much needed space, none renewed or expanded the education or library facilities, nor did they follow any unifying design or integrated campus plan – unlike that established elsewhere in the university. In addition to the lack of a medical school aesthetic theme, the failure to focus on renewed education and library facilities threatened the accreditation of the School of Medicine by the Liaison Committee on Medical Education (LCME) – a topic I have reflected on in past newsletters: (http://deansnewsletter.stanford.edu/archive/03_20_06.html#4).

As we look forward to celebrating the centennial of the School of Medicine in 2008 and the half-century anniversary of the medical school’s presence on the Stanford campus in 2009, we have an opportunity to correct some of these past errors and to establish a new physical presence for the future. Accordingly, we have been deeply engaged in

developing a new master facilities plan for the School of Medicine that will unfold over the next 15-20 years. This plan will be integrated into both the hospitals' plans for renewal and expansion and major new programs in the university. The scope of our planning is bold, exciting and transformative, and I will share the details with you later this year and then in regular updates thereafter. A central and integrating focus for the future of Stanford will be the Learning and Knowledge Center (LKC), which will be housed on the footprint of the current Fairchild Auditorium and which is planned for completion by 2009.

As our new medical school and center campus are developed and evolve it is my hope that the LKC will become the literal "front door" to the school (something that does not exist today) and that it will be a magnet for our students, faculty and staff. On Monday, October 30th the Executive Committee overseeing the LKC met with the NBBJ architects who have been developing this project. They presented the schematic drawings, which are now at the 30% completion level, and I was very pleased by the progress to date. They anticipate finalizing this phase of the project by the end of the calendar year, and I will be eager to share the results with you at that time. The LKC has four floors and will offer a compelling presence to our campus, although its full impact will only be appreciated when a number of integrating projects are completed during the next several years.

Among the exciting features of the LKC are its flexibility and the multi-use opportunities it offers. Because classrooms and seminar rooms are found on each floor of the building it will be alive with activity nearly all the time. It will also contain both traditional and leading edge state-of-the-art facilities for learning and teaching. These will include a Center for Immersive and Simulation Learning, large and small classrooms and highly flexible seminar and study rooms, a state-of-the-art approximately 360 seat conference center that can be divided into three separate rooms for smaller or more intimate functions, a large executive board room, and space for the office of the dean as well as a café, bookstore, exercise room and quiet space for students. Because a number of faculty, students and other important stakeholders are actively engaged with the design of the LKC, I believe that it will truly meet the programmatic needs that have been established and that it will be a role-model for schools across the nation.

While I have no doubt that students and faculty at Stanford were excited by the facilities when they arrived in 1959, there is simply no doubt that many of these buildings have become outdated. And although the renovations we recently made in the Alway educational facilities have helped to improve our current learning environment, they are not even close to what will be available when the LKC finally opens. We eagerly anticipate that day – but we still have much work to do, not only in completing the design of the building and its connecting elements but also in continuing to raise the philanthropic support necessary to bring this project to fruition. This of course is among my highest priorities – but we certainly can use your help as well.

Freeing Up Additional Space for Teaching and Research

As we plan for facilities for the future school of medicine, it is important to recognize that we can only sustain our educational, research and patient care missions if we find additional space in what is currently a very limited footprint. Accordingly, after much thought and deliberation, I have concluded that we must move the majority of the School's administration to an off-site location in the near future. Ultimately it is our plan to locate these important administrative units in the new North Campus facility that the University is developing in Redwood City. However, since it will be 5 years before the new North Campus is available, an interim off-site move will be necessary.

Marcia Cohen, Senior Associate Dean for Finance and Administration, and I have convened a School of Medicine Steering Committee to lead the planning for the move off-campus. The Steering Committee will address how we will move our staff, technology, and processes off-site while still maintaining our culture and effectiveness. The Steering Committee is comprised of Directors from the Dean's Office administrative areas, as well as DFAs and other staff, and is being led by Julia Tussing of Finance and Administration with assistance from Rebecca Trumbull of Institutional Planning and Lora Pertle of IRT.

The challenges we face, while perhaps appearing daunting, have been met successfully for years in the corporate world -- and from much greater distances than we are anticipating. I fully believe that with appropriate preparation this move can be a positive one. New technologies will assist in managing from the new sites and in addressing how we get work done on campus while working at a distance. New modes of communication and meeting models will benefit faculty as well as staff and allow for new types of meaningful interaction.

We will welcome your input to the Steering Committee and will be forming several subcommittees for which we will be seeking volunteers. We will also be holding town halls meetings to provide a forum for your opinions and suggestions. I will continue to report on this process as it unfolds over the next several months.

Finally, as we move forward on these relocation and redevelopment challenges we should also consider the larger questions about the changing nature of the workplace. Communication and information technology breakthroughs will enable work to be separated from traditional schedules and settings. In the coming years this transformation will reshape the workplace in currently unknown ways. Therefore it would be wise for us to consider the long-range changes that will impact the traditional workplace and consider how we reshape the way we work. Once the administrative units get settled in their new interim surroundings, I hope we will begin a deeper dialogue about the future workplace and how we can take the lead in the transformation of our current way of doing work to make that future work well for us at Stanford.

Planning for Pandemics and Other Disasters

As winter approaches concerns about the flu season rise appropriately. Last winter was filled with news of a possible influenza pandemic -- and that concern remains. In the interim there has been considerable planning within the University and Medical Center to

address our state of preparedness for a possible pandemic (or other disaster, such as an earthquake). While considerable progress has been made there is also still much to do.

By way of context, there have been three pandemics in the last century. The most notable of course was the 1918 H1N1 influenza pandemic, which resulted in 50-100 million deaths. The 1918 influenza virus arose from an avian strain that underwent mutations adapting it to human transmission. Unlike the usual seasonal influenza, which results in approximately 36,000 deaths, mostly in individuals >65 years of age, the H1N1 pandemic influenza had its greatest impact on otherwise healthy young adults. It is projected that if a new influenza strain arose that is as lethal as the 1918 one, as many as 150-300 million individuals around the world could die – obviously an event of devastating global proportions. In addition to the 1918 pandemic, there were also two lesser ones: the 1957 H2N2 and the 1968 H3N2 outbreaks. While these were less virulent, they still caused considerable morbidity and mortality.

While attention has focused on the H5N1 avian subtype, other strains (H9N2, H7N3 and H7N7) also can cross the barrier from poultry or wild migratory birds to humans. Whether or when a pandemic (in contrast to the regular seasonal outbreak) of influenza will occur is not known, but, based on past history, such an event seems likely. Accordingly, it is important to have an emergency plan in hand. In addition to planning for the future I would encourage each of you to consult with your healthcare provider about receiving the influenza vaccine this fall and winter.

The University has established an Infection Control Planning Group led by Dr. Ira Friedman and Larry Gibbs that has been developing policies for dealing with a possible pandemic. This group is also coordinating its planning with our medical center group led by David Silberman (SoM) and Dr. Eric Weiss and Vicki Running from the clinical programs and hospitals. In the event of emergency, it is essential that support for each of our key missions – education, research and patient care – be fully addressed. This is essential not only for the university and medical center but also for broader communities that we serve.

In the advent of a pandemic, the Infection Control Planning Group has determined that the best way to control the spread of influenza will be to create social distancing by ceasing academic teaching programs and having undergraduate students leave the campus and, ideally, return home. A similar approach will be taken for graduate students, although it is recognized that approximately half of these students will have their permanent residences locally and would not return to their parents' homes as would the undergraduate students. Certainly determining the triggers that would lead to this social distancing program are critical and the criteria for these triggers are being finalized. At the same time, plans are being developed for how we would sustain vital research programs in the advent of a loss of supplies, which, unlike a natural disaster, could, in the case of a pandemic, last for months. Mr. Silberman will be working with departments and investigators to effect as much advanced planning as possible. Plans are also being developed to make clear to our clinical faculty their individual responsibilities during a

pandemic, in light of the fact that many of them have responsibilities in education and research in addition to patient care.

It is anticipated that many of the remaining issues will be addressed and defined by the end of this calendar year. Additional communications will be forthcoming.

Diversity at Stanford University and the School of Medicine

On Tuesday morning, October 24th, Provost John Etchemendy hosted “Building on Excellence” in collaboration with the Center of Comparative Studies in Race and Ethnicity, the Institute for Diversity in the Arts at Stanford, and the Office of Diversity and Leadership in the School of Medicine. This event offered an opportunity to meet new faculty and visiting scholars of color but also to affirm Stanford’s commitment to enhance the diversity of our faculty and community. A new Diversity Cabinet has been established by the Provost’s Office, and efforts are underway to recruit and retain outstanding faculty, students and staff throughout Stanford. This is very much a goal we have set for the School of Medicine, where our long record of recruiting a diversified class of medical students has not been met by comparable success at the faculty level.

To help address goal this we are in the process of revamping the faculty search process based recommendations from a Faculty Searches Task Force, a group I charged last summer to address this important issue. At the Executive Committee meeting of November 3rd, Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, and Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership, led a lively discussion on the work of the Task Force, which had focused on such aspects of faculty searches as the challenge of assembling a diverse candidate pool and the phenomenon of unconscious bias.

Unconscious bias occurs in faculty searches when committee members take cognitive shortcuts that inadvertently and prematurely narrow the applicant pool. For instance, Steinpreis, Anders, & Ritzke found that, when evaluating identical application packages, male and female university psychology professors preferred 2:1 to hire “Brian” over “Karen” (*Sex Roles*, 41, 509,1999). In another evaluative setting, Goldin & Rouse, in *The American Economic Review*, 90, 4, 715-741 (2000), found that when individuals auditioned for symphony orchestras behind a screen, the percentage of female new hires increased 25 – 46% in the orchestras using this screening method. The good news is that individuals, once they are conscious of this type of bias, exhibit less of it, at least for a short time. So it becomes important to inform members of search committees of unconscious bias and reinforce that knowledge over the course of the search.

The Task Force also discussed the importance of providing search committees with the information they need in order to be effective, the importance of School leadership in promulgating and supporting changes to improve our processes and outcomes, and critical issues related to retention of the faculty we work so hard to appoint.

From these considerations the Task Force has developed a set of recommendations that include the following:

- The development of comprehensive Search Tool Kit that would include
 - A Search Procedures Manual (School and University protocols, best practices, criteria for appointment, etc.)
 - Background information about the dynamics of searches, including research findings about unconscious bias
 - Current faculty demographics and faculty gains and losses data
- The establishment of a new role for a designated search committee member. This individual, who would normally not be the chair of the committee, would assure that all reasonable steps have been taken to obtain a diverse pool of candidates and would bring issues of unconscious bias to the attention of the committee.
- Broader promulgation and discussion of faculty demographic and gains and losses data at all levels of the School, under the leadership of the Dean's Office.
- Further discussion of critical retention issues, including flexible work arrangements and childcare issues.

Over the next months, these recommendations will be further developed and implemented by the Office of Academic Affairs and the Office of Diversity and Leadership. The Task Force consisted of Dr. David Stevenson, Chair, Dr. Ben Barres, Dr. Louanne Hudgins, Dr. Abby King, Dr. Stephen Smith, Dr. Hannah Valantine, Judith Cain, Barb Miller, Rebecca Trumbull, and Kathryn Gillam. Thanks to all for their thoughtful deliberations and excellent recommendations.

Faculty Fellows – A Leadership Development Opportunity

I have been delighted to hear about the success of our first Faculty Fellows program this year. Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, has informed me that her Office is now soliciting nominations for the second class of Fellows. If you are interested in participating in this key leadership development program, please discuss the opportunity with your Department Chair or with Dr. Valantine. Fellows must be nominated by one of these individuals. The details of the program's goals and the criteria for selection are below. You can obtain a nomination form from Barb Miller at bemiller@stanford.edu.

Stanford University School of Medicine
Faculty Fellows Program: Diversity and Leadership

Dr. Hannah Valantine, Senior Associate Dean of the Office of Diversity and Leadership announces the launch of the second class of Faculty Fellows at the School of Medicine. A select group of Assistant and Associate Professors will be chosen as Faculty Fellows for the 2006-07 academic year. The purpose of the

Faculty Fellows program is to identify and develop a diverse group of junior faculty who have the potential to become our future leaders.

During the year, Fellows will attend a monthly dinner with key University leaders such as President John Hennessey and Dean Philip Pizzo. During these sessions, Fellows will learn more about leadership philosophy, strategy and style—“Personal Leadership Lessons”. Fellows will dialogue with colleagues and explore their own ideas on how to address leadership challenges as their careers develop. On a monthly basis they will also meet in small groups with a senior professor who will be their mentor.

If you are interested in being nominated for this opportunity, ask your Department Chair or Chief or Dr. Hannah Valentine to nominate you. Nominees should be assistant or associate professors who have demonstrated interest in and potential for leadership roles in the School of Medicine. They need to be respected by their colleagues and have demonstrated an ability to influence others. In addition, they should be advocates for change and for increasing the diversity of the School of Medicine. They should have demonstrated the ability to think strategically and systemically and lastly, they should be interested in taking on leadership roles in the future. Fellows are expected to attend all dinner meetings and mentoring group meetings.

You can obtain a nomination form by contacting Barb Miller at bemiller@stanford.edu or at 58402.

Nominations are due by **November 22, 2006**. The new Fellows class will be announced in January and will begin meeting in February 2007.

Medicine on a Global Stage

Concerns about health care in the United States are again moving to center stage, and the problems and potential solutions are daunting. Health care costs continue to rise (now over 16% of the GDP); the number of Americans who are uninsured or under-insured tops 40 million and is climbing as businesses seek to alter or cut benefits; access to medical care is fractured and for many the only entry point is through hospital emergency facilities (which are severely overburdened); the geographic distribution of physicians or their specialties is not consonant with the needs of communities or populations; the availability of primary care physicians is limited (and is not attracting sufficient new entrants); and the aging population further stresses the care delivery system – an issue that will be further exacerbated when Medicare reaches a seemingly inevitable financial crisis during the next decade or so. Coupled with these serious problems are the risk for a global pandemic (see above) and the already extant and growing problem of obesity in children and adults - with all its related co-morbidities. These and related issues have been discussed in recent medical journal and lay press articles and books, and was the topic of 8th Annual Thomas Fogarty Lecture given by Andy Grove, Senior Advisor and Former Chairman of Intel to a standing room crowd in the Arrillaga Alumni Center on

Thursday November 2nd. A similar set of issues was discussed at the California Healthcare Institute Board meeting by a representative of the Governor's office in anticipation of a health care plan for 2007.

Numerous solutions have been posited to address the lack of an organized and comprehensive health care system in the United States, although most advertently or inadvertently simply shift costs without really addressing the fundamental underlying problems and inequities. While a number of current political and other leaders continue to insist that only market forces will correct the cost escalations in healthcare, virtually every experience to date suggests otherwise. The most recent trend is the shift of responsibility and cost from employer to consumer (see Bloche G. *Consumer-Directed Health Care* NEJM 2006;355:1756-1759). This approach has the merit of increasing personal responsibility but it also simply shifts cost, and it still treats medicine and healthcare as a commodity – which in my opinion remains a fundamentally flawed assumption. But increasingly both physicians and hospitals are being compared and paid based on quality of their performance— a good thing, so long as the metrics are reliable and appropriate.

I have previously shared my belief that a radical approach is needed to address the fundamental problems of American health care, but I do not think this will be achieved – or likely even begun – on a national basis unless there is a major national crisis. And while I have felt that some variant of a single payer model has merit, I readily acknowledge that this seems unlikely given the culture and health care expectations of Americans, certainly for the foreseeable future. Even though a proposal for a single payer system made it through the California legislature, its veto by the Governor makes it most unlikely to succeed at least for the next gubernatorial term. At the same time, I am increasingly persuaded that a system embracing the principles outlined by Professor Victor Fuchs and EJ Emmanuel entitled “Health Care Vouchers – A Proposal for Universal Coverage” (NEJM 2005; 352:125501260) may be more acceptable to the current constituencies. But even this proposal may be seen as too radical – which is unfortunate indeed. Moreover, the changing landscape in U.S. health care is increasingly global in scope. . Whereas not too long ago a number of leading U.S. medical centers set up international programs to attract foreign patients to come to their centers in the U.S., the movement of patients to seek lower cost care outside of the U.S. is also a rising tide (see: A Milstein and M. Smith, America's New Refugees – Seeking Affordable Surgery Offshore. NEJM 2006; 355:1637-1640.

Even as we focus on health care costs, it is important to also focus on health and wellness – something that Andy Grove echoed and that the Governor seems ready to advance. Personal responsibility can make a significant difference in addressing serious health care risks and can offset such rising problems as obesity. But I fully recognize that changes in human behavior are also hard to accomplish. AIDS is a good example; changes in risky behavior and the use of condoms could stem transmission – yet the global prevalence of AIDS continues to rise. The level of obesity across the nation and around the world is another good example. Nonetheless, attention to health and wellness and aligning incentives to achieve and sustain them are as important as addressing our approach to

treatment of human disease. I write these words on the eve of the NYC Marathon, where over 37,000 individuals from around the world will join me in a statement for health – including Stanford Emeritus Professor Peter Wood, who at 77 years of age, is an admirable role model for wellness that we might all emulate!

Awards and Honors

- ***Spirit Award Winners:*** For the sixth consecutive year, two School of Medicine staff members have named as the Employee of the Year and both will be honored at the annual Staff Recognition Banquet on Thursday November 9th. This years Spirit Award winners are:
 - ***Nancy Winningham***, Faculty Compensation Manager
 - ***Homer Abaya***, Administrative Associate to the Chair of the department of Otolaryngology/Head and Neck Surgery.

Please join me in congratulating both Ms. Winningham and Mr. Abaya.

- ***Dr. Sarah Donaldson***, Catharine and Howard Avery Professor, has been selected to receive the 2007 Gold Medal from the American College of Radiology. She will receive the award in May 2007. Congratulations Dr. Donaldson!
- ***Dr. Martin Brown***, Professor of Radiation Oncology, has been selected to receive the Henry S Kaplan Distinguished Science Award from the International Association for Radiation Society. Congratulations Dr. Brown!
- ***Alfred T. Lane, M.D.***, Professor of Dermatology and of Pediatrics, has just been elected President of the Association of Professors of Dermatology. Congratulations Dr. Lane!
- ***Marti Trujillo***, Student Service Officer in Student Affairs, has been nominated to serve a three-year term as the financial aid liaison for the western region to the AAMC/Group on Student Affairs. This Committee works through both the Minority Affairs Committee and the Community on Student Financial Aid (COSFA). Congratulations, Marti!
- ***Irving L. Weissman, M.D.***, Virginia & D.K. Ludwig Professor for Clinical Investigation in Cancer Research, Professor of Dev Bio & by courtesy of Neurosurgery & Biological Sciences, will receive the John Scott Award and the American Italian Cancer Foundation Award. Congratulations, Dr. Weissman!
- ***Dr. Paul Yock***, the Martha Meier Weilland Professor of Medicine and Professor of Mechanical Engineering has been named the recipient of the TCT Career Achievement Award for his invention of some of the most important devices in interventional cardiology – along with his accomplishments as a teacher, clinician, and mentor. Congratulations Dr. Yock!

Upcoming Events

Brainstorms: New Frontiers in Science and Technology

Tuesday, November 7

7:30 – 9:00 pm

William R. Hewlett Teaching Center

Speaker:

Sanjiv “Sam” Gambhir, MD, PhD, Director, Molecular Imaging Program at Stanford (MIPS); Head of Nuclear Medicine; Professor of Radiology & Bioengineering

For more information: <http://events.stanford.edu/events/92/9248/>

This event is open to the public

TechNet Innovation Summit 2006 at Stanford

Wednesday, November 15, 2006

8:30 am – 1:00 pm

Memorial Auditorium

America's top leaders in technology will discuss emerging industry trends as well as the public policies that will shape the future of our nation. Moderated by award-winning journalist **Charlie Rose**, this event will be taped for broadcast and will feature:

Welcoming Remarks: President John Hennessy

Panel I: What is the Future of the Internet?

Featuring: **Brian Halla**, CEO, National Semiconductor; **Reed Hastings**, Founder and CEO, Netflix; **Jerry Yang**, Founder, Yahoo!

Panel II: Green Tech: Solutions for America's Future

Featuring: **John Doerr**, Partner, Kleiner Perkins Caufield & Byers; **Scott McNealy**, Chairman, Sun Microsystems

Panel III: The Global Knowledge Economy - Keeping our Competitive Edge

Featuring: **Bill Gates**, Chairman, Microsoft

Ticket Information:

- ☐ The event is open to Stanford faculty, students and staff.
- ☐ One (1) free ticket available per Stanford ID.
- ☐ Tickets must be picked up in person with Stanford ID at the Stanford Ticket Office beginning Wednesday, November 8.

- Special ticket distribution in White Plaza on November 13 & 14 from 11:30 a.m. to 1:30 p.m.
- Limited tickets may be available at the door on the day of the event at Memorial Auditorium.
- **Stanford Ticket Office location/hours:**
1st Floor, Tresidder Memorial Union
10:00 a.m. - 5:00 p.m., Monday-Friday
12:00 noon - 4:00 p.m., Saturday.
- For further event information phone: 725-2787.

Appointments and Promotions

Matthew Bogyo has been reappointed to Assistant Professor of Pathology and Microbiology & Immunology, effective 11/1/06.

Gregory Enns has been promoted to Associate Professor of Pediatrics (Medical Genetics) at the Lucile Salter Packard Children's Hospital, effective 11/1/06.

James Faix has been reappointed to Associate Professor of Pathology effective 11/1/06.

Robert S. Fisher has been reappointed to Professor of Neurology and Neurological Sciences, effective 11/1/06.

Michael K. Gould has been promoted to Associate Professor of Medicine (Pulmonary and Critical Care Medicine) at the Veterans Affairs Palo Alto Health Care System, effective 11/1/06.

Sherril Green has been reappointed to Associate Professor of Comparative Medicine, effective 12/1/06.

Basit Javaid has been appointed to Assistant Professor of Medicine (Nephrology), effective 11/1/06.

Christopher R. King has been promoted to Associate Professor of Radiation Oncology, effective 11/1/06.

Cheryl Koopman has been reappointed to Associate Professor (Research) of Psychiatry and Behavioral Sciences, effective 12/1/06.

Gordon K. Lee has been appointed to Assistant Professor of Surgery (Plastic and Reconstructive Surgery), effective 11/1/06.

Shoshana Levy has been reappointed to Professor (Research) of Medicine (Oncology), effective 11/1/06.

William Robinson has been reappointed to Assistant Professor of Medicine (Immunology & Rheumatology), effective 11/1/06.

Jessica Rose has been reappointed to Assistant Professor of Orthopaedic Surgery at the Lucile Salter Packard Children's Hospital and the Stanford University Medical Center, effective 11/1/06.

Stephen J. Ruoss, has been reappointed to Associate Professor of Medicine (Pulmonary and Critical Care Medicine), effective 10/1/06.

Jane Tan has been reappointed to Assistant Professor of Medicine (Nephrology) effective 10/1/06.

Ann Weinacker has been promoted to Associate Professor of Medicine (Pulmonary and Critical Care Medicine), effective 11/1/06.

Dean's Newsletter

November 20, 2006

Stanford Becomes a Ludwig Cancer Center

Shortly after my arrival at Stanford in 2001, I asked a faculty task force to explore whether the School of Medicine should seek to become a National Cancer Institute (NCI) designated cancer center and/or a Ludwig Cancer Center. As you know, the School committed itself to apply to the NCI for designation. Thanks to the enormous efforts of many faculty our application was submitted this past February; it was critically reviewed in the spring and presented to the Council of the NCI this past summer. We achieved an excellent score and are awaiting notification once the NCI budget has been passed. In parallel we also pursued the possibility of becoming a Ludwig Cancer Center. On November 14th the Ludwig Foundation announced that Stanford is one of six centers in the United States that will receive approximately \$2 million of support annually in perpetuity as a Ludwig Cancer Center. This is certainly wonderful news.

Each of the Ludwig Centers will have a different focus and all will collaborate as part of a novel network of centers of excellence. The six newly named Ludwig Centers and their Directors are:

- **Ludwig Center at Stanford University:** Irving Weissman, M.D. has been named the Director. Our center will focus on understanding the role of normal stem cells in tissue regeneration versus that of cancer stem cells. The Stanford center will attempt to isolate cancer stem cells in all human cancers and develop new therapies that target these cells to eliminate the disease at its source.
- **Ludwig Center at Dana-Farber/Harvard:** George D. Demetri M.D. will serve as Director. This center will focus on translational medicine, and in particular the

design and implementation of early drug development focusing on mechanism-targeted therapies in a way that links preclinical to proof-of-concept clinical research.

- **Center at Johns Hopkins:** Kenneth Kinzler, Ph.D. and Bert Vogelstein, M.D. are the Directors. This center will focus on the genetic bases of human cancer with the goal of developing novel approaches for the early detection and treatment of cancer.
- **Ludwig Center at Memorial Sloan-Kettering:** James P. Allison, Ph.D. is the Director. This center will focus on the role of the immune system in controlling and treating cancer and in fostering the translation of promising laboratory research into novel diagnostic tools or immunological therapies.
- **Ludwig Center at MIT:** Robert A. Weinberg, Ph.D. will serve as Director. This center will focus on metastases – one of the most fundamental and still least understood areas of cancer biology.
- **Ludwig Center at the University of Chicago:** Geoffrey L. Greene, PhD and Ralph R. Weichselbaum, M.D. will serve as Directors and, like the MIT center, will focus on the important problem of cancer metastases.

Thanks to the support from the Ludwig Foundation, these excellent investigators and centers will further advance the fundamental understanding of cancer. We are pleased and proud to be among the newly named Ludwig Cancer Centers.

Lane Library in the 21st Century: *LaneConnex 2006*

Three years ago Debbie Ketchell joined the School of Medicine as our Associate Dean of Knowledge Management and Director of the Lane Medical Library. Since her arrival, Ms Ketchell has led a transformation of the Lane Medical Library and has made it one of the most digital and accessible medical libraries in the nation. Indeed, when the LCME visited Stanford a year ago they were enormously complimentary of the tremendous changes that had occurred in Lane Library under Ms. Ketchell's leadership. I certainly share those accolades and am only sorry that a number of personal issues have led Debbie to decide to return to Seattle on a permanent basis (she has been commuting since she arrived at Stanford). I want to thank Debbie for the tremendous work she has done at Stanford – which has certainly moved Lane Library into the 21st Century. On November 8th Debbie gave an update on the LaneConnex to the Dean's Staff meeting, and I asked her to summarize her presentation so I could share it with you. Here is what she wrote:

“The mission of the Lane Library is to get the right knowledge, to the right person, at the right time, in the right context in support of translational research, innovative education and advances in patient care at SUMC. Our strategic initiatives are to create the digital library, develop smart interfaces, develop a learning connection, and re-envision the library as place.

The library celebrated its 100th anniversary this year in partnership with the alumni association. Alumni from the class of 1939 to 1982 talked about their memories of Lane during the April 2006 celebration of the Lane Centennial. You

can view these videos on our “Celebrating 100 Years” website (see: http://med.stanford.edu/about_photo/archive/05_26_06_lane100.html). In 1906, Lane was the largest medical library west of Chicago. In 2006, Lane provides a ubiquitous connection to a broad spectrum of information anytime, anywhere, information management training for clinical evidence, research data management and scholarly productivity, and has become a recognized leader nationally for innovation. The school’s accreditation report stated: “The medical school, through the leadership of the library staff, has created a “library without walls” allowing students and faculty to have access to information from any location.”

During the past three years our current journal titles have jumped from 1700 to 3700, of which 95% are online and of which over 1500 are back to volume 1. These articles are linked from PubMed, Google Scholar, Science Citation Index and other search systems. DocXpress, our digital article delivery service, became an instant hit with students and faculty. An article is requested online, we obtain a digital copy, and you “pick it up” online at your convenience. The request button is built into our website and linked from PubMed and Google Scholar. Much of Lane’s core reference, texts, atlases, protocols, images and videos – across both clinical and basic sciences – are online. Just a few of the titles are UpToDate, eMedicine, AccessMedicine, Anatomy.tv, Images.MD, MD Consult, Ovid, Proteome Knowledge Library, Protein Lounge, Methods in Enzymology, Current Protocols, ExamMaster, USMLEasy and Faculty of 1000. Faculty on sabbatical in Paris or waiting in the airport, residents at the VA or on vacation in Mexico, students on rotation at Santa Clara or at home can access this digital library through a simple SUNetID authentication.

So what is happening to print? Our pre-1960 and foreign language journals are into a high-density, preservation storage facility – over 67,000 volumes in the past year. Collaboration with Google allowed the scanning of all of our pre-1923 books and government documents (30,000 volumes) that are now downloadable as PDF files through Google Books. Our Rare Books were evaluated to both describe our rich, unique collection and determine their current worth. It is an amazing collection. These books will remain on campus.

LaneConnex, our new web interface, is designed to find and retrieve information with a single search. More Stanford content (e.g., Medicine Grand Rounds videos) is included. Search results are displayed by relevance and designed for easy scanning. If you search for “Science”, the journal link will be at the top of the list. If you search for “proteome” some of the results are an FAQ on how you can search the data generated by a laboratory kit, a link to the Cold Spring Harbor protocols and ongoing clinical trial in ClinicalTrials.gov. We encourage you to make the Clinical or Bioresearch Portal your homepage with their custom “inside the digital covers” search. If you search on the Clinical Portal for “Kawasaki” you get links to the topic in eMedicine and a calculator in MedCalc3000.

LaneConnexion is our successful liaison and training program. The liaison program matches a librarian or informationist with departments. We have strong partnerships with the Practice of Medicine course, Office of Postdoc Affairs, SUMC Research Council, SPCTRM and others to provide information management skills training. The breadth and depth of our workshops are increasing each year. We are developing methods to integrate our best clinical information into clerkships and the electronic health record. We began a bioresearch information program with the recruitment of Yannick Pouliot PhD. Dr. Pouliot is solving the problem of finding the right bioresearch tool and learning how to use it effectively. The revamped Bioresearch Portal and a series of new research data workshops are already making a difference in the lives of our post-docs.

Cosmetic updates to the facility over the past three years such as wireless access, electrified tables, comfortable furniture, up-to-date equipment, gate-less entrance, art and plants, plasma event board, and exhibits have all contributed to a more functional, friendly and useful place for collaboration and study.

So what's next? Ripe areas for knowledge development are components of a virtual translational research hub; embedded clinical reference in the EHRs; bioinformatics data management support; clinical evidence built into training; and planning for an extended stay in the Lane building while looking forward to the future LKC2."

A visual update is available at <http://lane.stanford.edu/services/about/lane2006update.pdf>. Clearly enormous progress has been made under Debbie Ketchell's leadership and she has set the stage for great things to come. Please join me in thanking Debbie for all that she has done for Stanford and in wishing her well in all her future endeavors.

AAALAC Site Visit Offers Praise for Stanford

The Association for Assessment and Accreditation of Laboratory Animal Care (AAALAC) was founded in 1965 as a voluntary, not-for-profit organization to promote higher standards of laboratory animal welfare. Since its founding it has grown significantly and is now comprised of 66 member organizations and over 700 accredited laboratory programs; there is an increasing involvement of programs in Europe and Asia. AAALAC is organized around representatives of its member organizations along with a small staff located in Frederick, Maryland and a Council on Accreditation that includes broad expertise in science and laboratory medicine. AAALAC is not a regulatory organization, and it carries out its work by site visits rather than inspections. It is very much a peer review process, and it offers guidance to universities and organizations on how well they are meeting quality standards in laboratory animal care. At the conclusion of a site visit the visiting team issues a written report that delineates either mandatory items, which must be fixed to remain accredited, and/or suggestions for improvement, which are meant to serve as guideposts to the organization being reviewed.

On November 13-14th, a four person AAALAC site visit team reviewed Stanford's animal laboratory program in considerable detail. They met with faculty and staff and toured the Research Animal Facilities (RAF) as well as dozens of research laboratories. The site visit team will issue a report based on their observations to the Council of Accreditation, which will, in turn, prepare the official comments to Stanford regarding this assessment. The site visit team had an exit interview with a number of university leaders and shared their preliminary observations. They indicated that these preliminary observations could be shared more broadly – so I am taking the liberty of doing so.

The news is excellent: No mandatory items were identified, which means that Stanford's accreditation will be sustained. The team identified nine helpful areas for improvement – all of which I am sure will be pursued. The site visitors were extremely complementary of Stanford's performance, noting in particular that the support the research animal programs received from the School and University administration was excellent, that the animal facilities are top-notch and well maintained, and that the education and policy information available to investigators and staff is excellent. They also praised the Lab Partner's Program and noted that occupational safety was excellent as were the animal husbandry staff, veterinarians, and technicians. They commented that the animal enrichment programs for subhuman primates were also quite excellent. Overall, they were highly laudatory.

Without question, a visit as successful as this one appears to have been (recognizing that we only have the preliminary report) happens only because of the excellent work of faculty and staff. I want to thank and give praise to the members of the Department of Comparative Medicine for their exemplary efforts and also recognize the leadership of Dr. Linda Cork, Chair of Comparative Medicine. They have much to be proud of – and we all owe them our gratitude and praise.

Thanking Those Who Help Make Stanford Great

We are so very fortunate to have wonderful students and faculty at Stanford who advance knowledge on numerous fronts, along with faculty and trainees who bring state-of-the art treatments to adults and children facing the challenge of serious illness. We frequently celebrate their accomplishments and bask in the glory of the accolades they deservedly receive. Despite the remarkable work of these individuals, none of these successes would be fully realized without the dedication, commitment, energy and support of the staff who provide the essential underpinning to the Stanford Medicine community. I had an opportunity to thank some of these important individuals at the Annual Staff Recognition Dinner that was held on Thursday, November 9th in the Faculty Club. This is always a festive event and I feel privileged to meet members of our staff who contribute so much in making Stanford such a great institution. It is also gratifying to observe how much our staff enjoy and value being part of our community – and that many are willing to serve Stanford for decades. In addition to thanking staff members who have served for 5, 10, 15 and 20 years of service, we also had the opportunity to celebrate 32 individuals who reached their 25, 30 or 35th anniversaries. While I want to thank and acknowledge every

member of the Stanford community I am listing below those individuals celebrating 25, 30 or 35 years of service.

25 Year Employees

Pamela Bernstein	Dermatology
Jutta Bischof	Genetics
Susan W. Bryson	Psychiatry
Marita Reilley Grudzen	Student Affairs
Joan M. Hebert	Genetics
Robin E. Holbrook	Microbiology and Immunology
Stephanie Johnson-Gray	Finance and Administration
Margaret A. Malone	Communications & Public Affairs
Linda McIntyre	Information Resources and Technology
Karen E. Mulkey	Research Management Group
David J. O'Brien	Institutional Planning
David R. Parks	Genetics
Holly A. Schrandt	Pathology
Georgette Stratos	Medicine
James T. Taskett	Visual Art Services
Eva Vasquez	Student Affairs
Claudia B. Weber	Genetics

30 Year Employees

Patricia L. Glennon	Pediatrics

HHMI Opens National Competition for Physician-Scientists

We have just been informed that the Howard Hughes Medical Institute (HHMI) has opened a national competition for the appointment of outstanding physician-scientists as HHMI investigators. Approximately 15 physician-scientists “who have demonstrated originality and productivity as patient-oriented researchers and who show exceptional

promise for future research contributions” will be appointed. The specific eligibility requirements are available at http://www.hhmi.org/research/competitions/investigator_por/ and include an MD or MD/PhD (or the equivalent), a license to practice medicine in the United States, a tenured or tenured track position at a eligible institution (which of course includes Stanford) and a career as an independent investigator between 4 – 16 years, with evidence of independence by being a PI on an active NIH RO1 grant or a project leader on an active NIH PO1 grant along with a distinction as a patient-oriented investigator. Moreover, the applicant must be able to commit 75% or more of her or his time to research. Unlike many past HHMI competitions, there is no institutional limit on the number of applications and faculty can apply to HHMI without specific institutional approval. If you feel you meet the basic eligibility requirements and would like to apply for this important award, please review the website noted above. Applications are due by January 18, 2007 at 3:00 p.m. (EST).

I also want to point out that HHMI anticipates a separate general competition for HHMI investigators in the spring of 2007, and details about that will be shared as soon as they are available. If you have questions about the Patient-Oriented Physician-Scientists HHMI investigator opportunity that are not answered by the website or would like some additional advice, please feel free to contact my office and we will do the best we can to assist you.

The Goodman Simulation Center Opens

After nearly a decade of planning by Dr. Tom Krummel, Professor and Chair of Surgery, and his colleagues, the opening of the Goodman Simulation Center was celebrated on Tuesday evening, November 17th. Martha Marsh, President and CEO of Stanford Hospital & Clinics (SHC), and I hosted a festive event to thank the lead donors who provided the critical support to help bring the Goodman Simulation Center to life.

This unique facility is located at SHC near the operating rooms and provides state-of-art simulation of numerous surgical and interventional procedures. It builds on the work of The Center for Immersive and Simulation Learning (CISL) led by Dr. David Gaba, Associate Dean for Immersive and Simulation-based Learning and Professor of Anesthesia, as well as Dr. Krummel’s own research. The Goodman Simulation Center, which includes the Dr. Ralph and Marilyn Spiegel Simulation Suite, the Derry and Charlene Kabcenell Simulation Lab and the Dr. Roy M. Frank Skills Training Station, will provide an accessible simulation learning environment for students and trainees as well as experienced clinicians, nurses and other health professionals. It is also part of the School’s broad based learning environment that now includes sites at SHC, the VA and LPCH and that will be joined by a central facility at the Learning and Knowledge Center that will open in 2009. But the opening of the Goodman Simulation Center takes a giant step forward in realizing a major transformation of Stanford Medicine and I am grateful to Dr. Krummel for his leadership.

I would also like to thank Dr. Gaba and Ms. Maggie Saunders for their critical efforts and collaboration in bringing this dream to fruition. Finally, I would like to thank the key donors for this project: Professor Emeritus Joe Goodman and his wife Hon Mai Goodman, who provided the naming gift. I also want to thank Skip and Linda Law, Derry and Charlene Kabcenell and Lynne Frank along with Bruce Bingham, John and Jill Freidrenrich, Bob and Chandra Friese, Howard and Martha Girdlestone and Mike Paioni.

I hope you will take time to visit the Goodman Simulation Center – and most importantly to use it!

Transitions in Pediatrics

After thirteen years of exemplary leadership, Dr Harvey Cohen, Arline and Pete Harman Professor and Chair of Pediatrics, officially stepped down from his role as chair on November 15th. Following a host of farewells by his colleagues at the Lucile Packard Children's Hospital, the Lucile Packard Foundation for Children's Health, the department and community, we had a final thank you reception on Monday, November 13th. Dr. Cohen will soon begin a sabbatical in the laboratories of Professors Richard Zare, Marguerite Blake Wilbur Professor in Natural Science, and Rob Tibshirani, Professor of Health Research and Policy (Biostatistics) and of Statistics, during which he will focus on applying proteomics to the study of various pediatrics illnesses.

During his tenure as chair Dr. Cohen and his colleagues made remarkable progress on transforming the Department of Pediatrics as well as children's services at LPCH. As a consequence LPCH is now viewed as one of the nation's leading pediatric programs, and there is every reason to believe that the trajectory of success and excellence will be sustained – and hopefully even surpassed – in the years ahead. We all owe a debt of gratitude to Dr. Cohen for his many contributions. And we also wish him well in his new endeavors. I have had the personal pleasure of knowing Harvey Cohen since we served together as new interns at the Children's Hospital, Boston, and it is thrilling to witness the many important contributions he has made throughout his noteworthy career – and especially those made at LPCH and Stanford. Thanks Harvey.

While we have anticipated Dr. Cohen's departure for some time (he was clear that the best time for transition was while things were still on the curve of upward success rather than at its peak – a good philosophy) we hadn't anticipated that Dr. Ted Sectish would also be transitioning from his role as Director of the Pediatric Resident Training Programs. Dr. Sectish has done a superb job since he joined Stanford in 1993 and is nationally recognized for his knowledge and leadership. Indeed his prominence has won him two important new positions: first as the Director of Future of Pediatrics sponsored by the Federation of Pediatric Organizations (FOPO) and, second, as the Program Director for the Boston Combined Residency Program at the Children's Hospital, Boston. While I am certainly disappointed that Dr. Sectish will be leaving Stanford, I take some comfort that he will be leading the program at my alma mater, and I am sure that the contributions he will make in Boston and for FOPO will be beneficial to Stanford and

LPCH as well. Please join me in congratulating and thanking Dr. Sectish for his many important – and future – contributions.

Dr. Ken Cox Will Serve as Interim Chair of Pediatrics

I am very pleased to announce that Dr. Ken Cox has agreed to serve as the Interim Chair for the Department of Pediatrics beginning November 15th. As noted above, Dr. Harvey Cohen, who has led the department as chair with distinction for the past 13 years, will be stepping down to resume his research and clinical work. I had anticipated that our new chair of Pediatrics would be arriving at Stanford in early December but unfortunately a serious and unanticipated medical illness arose in the candidate's family that led to a change in plans during the past two weeks. I have already actively resumed the search process and am hopeful that we will soon identify another outstanding candidate, but this will certainly delay the time of arrival of the next chair – likely to next summer. Accordingly, I am most grateful that Dr. Cox has agreed to serve as the Interim Chair.

Dr. Cox, Professor of Pediatrics (Gastroenterology), is well qualified to assume these important responsibilities. He is currently serving as the Chief of the Division of Gastroenterology as well as the Associate Chair of the Department of Pediatrics. In addition Dr. Cox serves in two major institutional roles, as the Senior Associate Dean for Pediatrics and Obstetrics and as the Chief Medical Officer at the Lucile Packard Children's Hospital (LPCH). I have had the privilege and pleasure of working closely with Dr. Cox since my arrival several years ago, and I have the utmost confidence in his knowledge, commitment and dedication to pediatrics, LPCH and Stanford. He is also able to balance a number of important challenges and responsibilities simultaneously and seamlessly – which is clearly important at this time.

Naturally because of these additional and important responsibilities, Dr. Cox will appreciate the support and assistance from his many colleagues throughout the Department, School and Hospital. The role of the Chair of Pediatrics also includes the position of Chief of Staff at LPCH. However, given the breadth of his current responsibilities, Dr. Cox, Chris Dawes (President and CEO, LPCH) and I have decided that he should not serve that additional role. Thankfully, Dr. Christy Sandborg, Professor Pediatrics and Chief of the Division of Rheumatology, has agreed to serve as the Interim Chief-of-Staff at LPCH, and Mr. Dawes will make a formal announcement about her appointment.

I am of course saddened that an illness has prevented our candidate from assuming the Chair of Pediatrics and we offer our best wishes to his family. But I am also grateful that Drs. Cox and Sandborg have agreed to serve as interim leaders, and I am very sure that they will do a wonderful job in supporting the faculty and staff in pediatrics until I work to identify the next chair. And of course I hope I will be able to do that as expeditiously as possible.

LIVERight Takes Steps to Convey its Message

The Asian Liver Center at Stanford University was established in 1996 by Dr. Sam So, Lui Hac Minh Professor of Surgery. It is the only non-profit organization in the United States that addresses the high incidence of hepatitis B and liver cancer in Asians and Asian-Americans. The Center carries out its mission through outreach, education and research. On Saturday morning, November 11th, the Center partnered with the Answer to Cancer Foundation to host a 5K LIVERight race on the Stanford campus to raise awareness and money to support its missions. I had the pleasure of speaking to the over 500 runners who, despite the rainy morning, used their steps to help improve awareness and prevention of hepatitis B. I was pleased to see a number of Stanford undergraduate and medical student volunteers helping with this event and with the important work of the Asian Liver Center.

Luncheon for Long-Term and Emeritus Faculty

On Wednesday, November 15th I was honored to host the annual luncheon for long-term and emeritus faculty. Over 75 faculty who have either been on staff at the medical school for more than 20 years or who are 60 years or older joined me in the Fairchild atrium where I spoke on Medical Education: Building on the Past for the Future. Without question, many of the individuals in attendance played seminal roles in helping Stanford to achieve its current level of success – for which we must all be appreciative. I shared with them some of the changes that are unfolding in the projected workforce for physicians and physician-scientists and my reflections about whether the ways this is being addressed are really sensible. I also commented on some of the changes occurring in the delivery of primary care by other health providers, including the “Walmart model.” I then focused on Stanford and on how our special mission truly does build on the past to educate future leaders, physicians and scholars. It is always a pleasure to speak to this group, given their wisdom and many contributions to Stanford past and future.

Upcoming Events

McCormick Lecture with Dr. Linda Buck: Deconstructing Smell

Tuesday, November 28

12:00 – 1:00 pm

Fairchild Auditorium

The McCormick Lectureship honors Katharine Dexter McCormick, an early feminist who devoted much of her long life to the welfare of women. After receiving a degree in biology at MIT in 1904, she became a leader in the fight for women suffrage and was a founder of the League of Women Voters. Later, she provided the major financial support for the development of the first oral contraceptive at the Worcester Foundation. On her death at age 92, she left a large bequest to the Stanford University School of Medicine with the hope that it would be used “in aid of women students attending the School of Medicine and more generally for the encouragement and assistance of women in pursuing the study of medicine, in teaching medicine, and engaging in medical research.” The lectureship, initiated by women at the medical school, and now an official function, is one of the ways of fulfilling the wishes of Katharine D. McCormick.

This year's guest speaker is Dr. Linda Buck whose research has provided key insights into the mechanisms that underlie the sense of smell in mammals. In recognition of her contributions, Dr. Buck has been the recipient of numerous honors and awards, including the Nobel Prize in Physiology or Medicine. For further information on Dr. Buck's background, visit: <http://www.fhrc.org/research/nobel/buck/>

Endangered Childhood: Disease, Conflict and Displacement

Tuesday November 28

4:15 pm

Bechtel Conference Center

The International Initiative at Stanford, United Nations Association Film Festival, Freeman Spogli Institute for International Studies and the Global AIDS Interfaith Alliance will co-sponsor a film and panel discussion on "Endangered Childhood: Disease, Conflict & Displacement." The film that will be shown is entitled *Their Brothers' Keepers: Orphaned by AIDS* and it will provide insight into the plight of children orphaned by AIDS. Following the film, Dr. Paul Wise, Richard E. Behrman Professor in Child Health and Society, will lead a panel on the impact of conflict and displacement, their psychological effects on child health and development, and work done to assist children affected by AIDS. The session will conclude with a Q&A session open to all. This event is free and open to the public. For further details see: <http://fsi.stanford.edu/events/4679>.

Awards and Honors

Dr. Sharon Hunt, Professor of Medicine, has received the American Heart Association's Laennec Master Clinician Award, the highest award offered to clinician. In recognition of her award one of her former trainees and now colleagues noted that "Sharon has taught just about everyone in transplant in the country!" which certainly seems to sum up the basis for this award. Congratulations to Sharon.

Dr. Mark Musen, Professor of Medicine and Computer Science, has received the Donald A.B. Lindberg Award for Innovation in Information by the American Medicine Informatics Association (AMIA). This award recognizes an individual for a specific technological, research or educational contribution that advances biomedical informatics. Congratulations to Mark.

Martha Trujillo, Director for Student Financial Services, has been nominated to serve for the 2006-2007 year as the Western Region Financial Aid Liaison to the AAMC/Group on Student Affairs. This committee works through both the Minority Affairs Committee and the Community on Student Financial Aid. Congratulations to Marti.

Happy Thanksgiving

This week begins the traditional holiday season and I want to wish each of you and your families a Happy Thanksgiving. Of course I would be remiss in not reminding everyone to have a wonderful time while still paying attention to monitoring and regulating personal thermodynamics!

Dean's Newsletter December 4, 2006

Planning the Future of the Stanford University Medical Center

Nearly fifty years ago a visionary group of University and School of Medicine leaders made the bold decision to relocate the medical school from San Francisco to the Stanford Campus. The realization of this plan, finalized on July 15, 1953, brought to life the dream of President Ray Lyman Wilbur, who had envisioned the power of the co-location of the medical and life sciences with the physical and social sciences of the university. Indeed, this vision was consistent with the recommendations of the 1910 Flexner Report, which noted that “a medical school should be an organic part of its parent university.” Further, when the medical school was officially moved in 1959, university and community leaders in the City of Palo Alto forged an agreement to establish Stanford Hospital and thus initiated a process that would transform the face of medicine, locally and globally, for decades to come. This partnership followed an association dating back to 1921, when the Peninsula Hospital became Palo Alto Hospital. Its new facilities had opened in 1930 in the buildings now known as the Hoover Pavilion. The design for the current medical center, which opened in 1959, began in September 1955 with architectural planning led by Edward Durell Stone. It initially consisted of three hospital, one clinic and four medical school buildings that still stand today – although they are now rapidly becoming obsolete as education, research or patient care facilities.

While the Stanford School of Medicine trained many outstanding clinicians and leaders during its 50-year stay in San Francisco (the Medical School was established in 1908 when Stanford assimilated the former Cooper Medical School into the University), its profile and national reputation quickly changed when the School was constructed on its current footprint in 1959. The contiguity of the medical school to its major affiliated hospital and to the university created partnerships that would promote elegant science and the foundations of what we now refer to as translational medicine (i.e., bringing discovery from the laboratory to the bedside).

The Historical Context

Under the leadership of Dr. Robert Alway, who served as Dean of the School of Medicine from 1957-1964 (succeeding Dr. Windsor Cutting) a number of major recruitments were made in association with the school's relocation. These were aimed at divesting the concept that the School had become too inbred during its San Francisco tenure. Among these were Dr. Norman Kretchmer from Cornell to lead Pediatrics, Arthur Kornberg (and his entire department) from Washington University to found the Department of Biochemistry, Joshua Lederberg from the University of Wisconsin to

found the Department of Genetics, Robert Chase from Yale to lead Surgery and David Hamburg from NIH to lead Psychiatry. These new recruitments were joined by two leaders from San Francisco: Avrum Goldstein to lead Pharmacology and Henry Kaplan to lead Diagnostic and Therapeutic Radiology – along with a young and rising star named Dr. Norm Shumway.

The Past Predicts the Future

In tandem with the move of the School and the opening of new facilities, a new curriculum for medical education was designed. Called the Five Year Plan, it followed principles that are remarkably similar to those of the New Curriculum we inaugurated in 2003. Based on a history recorded by the late long-time Stanford faculty member, Dr. John L. Wilson, the guiding principles for the Five Year Plan included:

- Stress upon principles rather than upon detailed mastery of subjects.
- A conjoint course in the basic sciences designed to overcome the splintering of biology into separate "subjects" which deal independently with structure, function and chemical processes.
- All laboratory exercises in biochemistry, physiology, microbiology, pharmacology and portions of pathology and anatomy will be combined into a single laboratory course to be conducted cooperatively by the six pre-clinical departments.
- The basic science course will be conducted in multi-discipline unit laboratories, each serving sixteen students as a "home laboratory" for a full year. These small laboratories are designed to foster a close relationship between students and the faculty members conducting the course.
- From the outset of their medical course, students will be guided toward increasingly greater degrees of independence in planning, executing, observing and interpreting experiments, in preparation for application of the skills and attitudes thus acquired to the advanced pre-clinical work which later will parallel related clinical experiences. The spread of the basic sciences throughout the medical program will permit an earlier introduction of clinical subjects. Here too, changes have been made to provide more unity in the curriculum.

With the recruitment of outstanding new leaders, new facilities and a new curriculum, the School was literally catapulted into national prominence. In looking back on the momentous changes that occurred a half century ago we are humbled by how many of our current “bold” efforts are really attempts to recapture some of Stanford’s past.

Current Forces Change Past Expectations

At the same time it is also interesting to note how time has forced changes in the original policies adopted for full-time faculty in 1959 – which included the following principles.

- All University faculty members should be appointed on the same basis and should share the same privileges and responsibilities;
- The primary responsibility of a University faculty is teaching and research;
- Faculty salaries should be derived from University sources;
- Full-time members of a medical faculty should not engage in the practice of medicine for personal gain;
- The use of knowledge and skill as physicians for the benefit of humanity by rendering medical care is an obligation of any group as capable for such care as a medical faculty;
- The continued use of such knowledge and skill by clinical faculty members is essential to effective teaching;
- The patient care rendered by a medical faculty must be limited to the amount required for teaching and research;
- A direct relationship between any income from patient care and a faculty member's salary is incompatible with the maintenance of university status.

While it was hoped that increased endowment support would enable these policies to be adopted, it is clear that the many forces that have changed the face of medicine in the ensuing 50 years have also altered these expectations, particularly for our clinical faculty.

A Legacy Building Its Future

But it is clear that the past 50 years have also witnessed tremendous changes in Stanford Medicine itself. Despite the smaller size of our faculty compared to peer research intensive schools of medicine (approximately 40% the size of UCSF, less than a third of Johns Hopkins and over 10% of Harvard Medical School), our school and faculty have made major contributions to science and medicine so that, in my opinion, we are among the very top schools of medicine in the nation. For example, our faculty continues to command the highest amount of peer-reviewed NIH funding per principal investigator of any peer school, and the awards and honors received by our faculty are exceptional in virtually every domain. Just this year they include two new Nobel Laureates (bringing the total to four), a winner of the Kyoto Prize, and three new NIH Pioneer Awards (and since this award was first given two years ago, seven of the 34 awarded across the entire nation have come to Stanford), among many others. The contributions of our faculty in basic research are the envy of virtually all of our peers. Our faculty have made remarkable contributions in major disciplines including cancer biology and treatment, stem cell biology and regenerative medicine, the neurosciences, cardiovascular medicine and surgery, immunology, transplantation and infectious diseases as well as genomics, imaging, informatics and virtually every field of medicine, surgery and science.

As a result of this extraordinary record of achievement, the Stanford University Medical Center has brought enormous credit and distinction to the University and our community. It has also transformed the health care of the citizens of Palo Alto and our neighboring communities by bringing them state of the art care as well as the latest innovations and discoveries in medicine and the biosciences. Stanford faculty have also played a major part in the economy and development of Palo Alto and our other neighboring communities by helping to launch the field of biotechnology, initially through discoveries in genetic engineering and since then through activities in the entire spectrum from basic discovery to the development of a wide range of medical devices.

Now, nearly 50 years following the move of the School to the Stanford campus, we face another array of remarkable opportunities and challenges. While the quality of our faculty and students is outstanding, a number of our medical school and hospital facilities will not meet our needs and missions – or the ability to serve our communities – in the next half century. Indeed for the past several years we have been deeply involved in developing a master plan for the medical school that is aligned with our major on-site affiliated hospitals (Stanford Hospital & Clinics and the Lucile Packard Children's Hospital) as well as with the Palo Alto Veteran's Medical Center. We have also been exploring the important question of how much of our future program can be developed on the current Stanford campus (which may include the proximate VA site) and how much will need to be housed at "off-site" locations.

Among the guiding principles for our deliberations has been the desire to do our best to house on campus as many of our research and education programs as possible so that they are in close contiguity to the university and our affiliated hospitals. Clearly this is essential if we are to continue to foster interdisciplinary education and research as well as the translation of knowledge from the laboratory to the patient. But we are challenged by limitations in the space available to grow on campus and by economic constraints in our goals of maintaining balance, functionality, sustainability and contiguity on campus. Thus, in developing our master facilities plan we have addressed space utilization and development not only on the medical center footprint but in the proximate areas (e.g., VA, Research Park) and at the evolving North Campus in Redwood City.

We have also tried to anticipate the growth of medical school faculty over the next 15-20 years and to do our best to assure a balance in our future investments in basic science and clinical science program development. As 2006 draws to a close we have approximately 785 full-time faculty in the School, and we are aware of the current faculty cap of 900 faculty. Accordingly, we have planned for several contingencies - how programs would develop if we were unable to exceed the cap, as well as how we would accommodate the increases in faculty size that might be necessary to meet our full programmatic requirements. In doing so, we want to assure that when our facilities plan is fully realized we will actually have space for our basic, clinician-scholar/investigator and clinician-educator faculty.

In considering the Medical School's facilities plan it is also important to recognize that we located in two jurisdictions, each with different rules and guidelines impacting future growth and development. For example, the original 1959 E.D. Stone buildings (i.e., Grant, Alway, Lane and Edwards) are in the City of Palo Alto, along with the entirety of SHC and LPCH and our sites on Welch Road. The rest of the medical school campus (i.e., Clark Center, Fairchild Science and Auditorium, Beckman Center, CCSR, the RAF, Pediatric Surgery Laboratory, Redwood Building, MSOB, MSLS, and Lucas Center) are in Santa Clara Valley and are governed by the General Use Permit (GUP) rules. In our 15-20 year master plan we intend to build, rebuild or renovate in all of these areas, as I will outline below. Based on this vision, we have been working with the University's Office of Land and Buildings as well as with the leaders of Stanford Hospital & Clinics and the Lucile Packard Children's Hospital to develop a well orchestrated and integrated facilities plan that complements and synergizes our discrete and mutual needs.

School of Medicine Master Facilities Plan 2006

Medical Center Area

Following is our most recent thinking regarding the School of Medicine Facilities Master Plan. As you may know, the School of Medicine falls under two jurisdictions: we are partially within the City of Palo Alto and partially within the County of Santa Clara. We are currently working on a number of components of the plan, and we are anticipating its full completion, which may take 15-20 years. This past week, the Hospital CEOs and I met with the Palo Alto City Council to introduce them to the Stanford University Medical Center Facilities Plan, which includes both hospitals and part of the School of Medicine. I am eager to share the full range of our planning with you. Thus, the description that follows here includes both the parts of the School that are under the jurisdiction of Santa Clara County and those that are within the City of Palo Alto.

Section of the Medical School under the Jurisdiction of Santa Clara County and the GUP:

1. We have received sufficient GUP space allocation (or the commitment thereof) to proceed with the planning of the following buildings at this time:
 - a. ***The Learning and Knowledge Center #1(LKC1)***, a 120,000 gasf (gross available square feet) facility on the site of the current Fairchild Auditorium. I detailed the current status of the LKC planning in a recent Newsletter (see: http://deansnewsletter.stanford.edu/archive/11_06_06.html#2), and it is our hope to complete this project by 2009. We currently anticipate that architectural design will be completed by the end of this year and that ground breaking will occur in later 2007 or early 2008. A key factor of course is completing the fundraising goals for this important project – which we are actively working on.
 - b. ***The Connectivity Elements Project***, while hardly the most visible part of our plans, is critical to the next phase of our medical school

campus. These include loading docks and a series of underground transportation tunnels that will link current and future buildings and that will permit deliveries of supplies and so forth safely and more seamlessly – and below rather than above ground. Work on this project is now beginning.

- c. ***Stanford Institutes of Medicine #1 (SIM1)*** will be a 200,000 gasf research building housed on the parking lot south of the CCSR. Architectural design for SIM1 will commence shortly. This building will be designed as either a two or three component building and is currently planned to house new or current faculty who are Members or Associate Members of the Stanford Institute for Stem Cell Biology and Regenerative Medicine, the Cancer Center/Institute and the Neuroscience Institute. We hope SIM1 will be ready for occupancy in 2009-2010.
 - d. ***Learning and Knowledge Center #2 (LKC2)*** will be a 85,000 gasf building on the site of the current Fairchild Science Building (see below) and will house the Library and Knowledge Center staff and student services, as outlined in the last Newsletter (see: <http://deansnewsletter.stanford.edu/#2>). In previous plans we had anticipated that these programs would be housed in renovated space in the Lane and Alway buildings but, as you will note below, we are currently hoping to rebuild the entire 1959 ED Stone Complex as our Foundations in Medicine and Science (FIMS) buildings.
2. For the following projects we have either an expectation of GUP allocation or an understanding that it will be available when the project is ready for initiation.
- a. ***Stanford Institutes of Medicine #2 (SIM2)*** will be a 150,000 gasf research building on the site of the lawn and trailers near the MSOB and Lucas Center. SIM2 will house the Cardiovascular Institute and, potentially, the Institute for Immunity, Transplantation and Infection. While we do not have full GUP allocation for SIM2 we do have a green light to proceed as soon as we have completed fundraising for SIM1. The availability of funding could impact the timeline (and potentially make completion earlier) but at present we have SIM2 slated for completion in 2016.
 - b. ***Stanford Institutes of Medicine #3 (SIM3)*** will be a 220,000 gasf research building on the current site of the MSOB, west of SIM1. The programming for SIM3 is incomplete, but it is envisioned to permit redistribution of Members and Associate Members of Institutes from SIM1 and SIM 2 so that each building will

accommodate 1-2 of the five Stanford Institute of Medicine (whose faculty will be Institute Members or Associate Members. Currently we project completion of SIM3 in 2019-2020.

Science and Engineering Quad 2 (SEQ2)

1. Work is currently underway on the SEQ2, which will be a new quad housing four buildings just south of the medical school footprint with a new pedestrian access along Via Ortega. The Energy and Environment Building, the first building in this quad, is currently under construction. The new **Bioengineering Building**, which will also be in this quad, will house faculty from our Department of Bioengineering, which is joint between the School of Engineering and the School of Medicine. Currently Bioengineering faculty are largely in the Clark Center, but this space is now fully occupied. When the Bioengineering Building is completed, in approximately 2011-2012, it will accommodate new recruits or some of the Bioengineering faculty currently housed in the Clark Center.

Section of the Medical School under the Jurisdiction of the City of Palo Alto

Approximately six months ago a request came from the Office of Land & Buildings to reconsider the wisdom of renovating the 1959 ED Stone Complex. In response, an alternative model was developed that we have now worked on from the perspectives of space utilization, programming, and economics. Based on current estimates, the cost to rebuild the ED Stone Complex is not significantly different from the cost to renovate it. However, these buildings are in the City of Palo Alto and, thus, our plans require approval from the City Council.

At our November 20th meeting with the Palo Alto City Council, while the focus of this meeting was appropriately on the renewal and expansion of SHC and LPCH, our proposal to rebuild the Grant, Alway, Lane and Edwards Buildings was also discussed. We anticipate that the decision regarding these buildings will be considered as part of the City's evaluation of the entire Stanford University Medical Center Master Plan and that, accordingly, it is likely that it will be 2-3 years before we have a clearance to proceed. But we will certainly have a good idea of the receptivity to this proposal along the way, and we will be conducting our building planning during this time. Based on this we currently envision the following project developments:

- a. **Foundations in Medicine and Science (FIMS).** This will be new laboratory research building designed to replace the 1959 ED Stone buildings and provide more modern research facilities to support both basic and clinical departments. While this project will be square foot neutral compared to the current footprint, it will provide research facilities that will be suitable for 21st century biomedical research. The FIMS will include:

- i. ***Foundation in Medicine and Science #1 (FIMS1)*** which will be a 160,000 gasf building on the lawn just north of CCSR. Because this site is unencumbered it will be the first of the FIMS to be constructed, and it will permit serial decanting such that the 1959 ED Stone Complex can be serially demolished and rebuilt. We are currently planning on FIMS1 being ready for occupancy in 2012. Once it is completed and SIM1 is constructed, it will be possible to empty and demolish the Fairchild Science Building and the Edwards Building and also begin the LKC2 project noted above.
- ii. ***Foundations in Medicine and Science #2 (FIMS2)*** is currently estimated to be a 110,000 gasf building. Once completed it would permit the demolition of the Lane and Alway Buildings. At this time we anticipate that FIMS2 will be completed in 2014-2015.
- iii. ***Foundations in Medicine and Science #3 (FIMS3)*** is planned as a 145,000 gasf building that would complete the replacement of the 1959 ED Stone Complex facilities and would result in the demolition of the Grant Building. Currently we are planning for FIMS3 to be completed in 2016-2017.
- iv. **800 Welch Road** is the former site of the Blood Bank (before its relocation to 3373 Hillview Avenue along with the SHC/LPCH clinical labs). Our plan is to ultimately reconstruct this building to house the ***Jill and John Freidenrich Center for Translational Research***.

When the entirety of the medical center plan for the School of Medicine is completed we will have constructed approximately 1,222,000 gasf of new facilities on the medical school campus but also will have demolished 644,993 gasf of existing buildings. The total new net square footage for the School on the Medical Center campus will be 557,007 gasf. While this may seem small in comparison to the enormity of the project, we will nonetheless possess facilities for education and research that will be state-of-the-art for decades to come. When coupled with the hospital renewal projects (see below) Stanford Medicine will be well poised to face the 21st century with facilities that are commensurate with the excellence of its faculty, students and staff.

Palo Alto VA and Research Park Area

We are currently holding a number of leases in the Stanford Research Park and ideally would like to consolidate or eliminate some of these in the years ahead. At the same time we are excited about the prospect of forging future research

alignments with the Palo Alto VA Medical Center. Also, after 2017 it would be prudent to assess the land sites that become available on the current Roche property, which is south of the VA on Foothill Expressway and which may offer the opportunity to develop an additional research corridor the borders the VA and University campuses.

1. ***Potential Palo Alto VA/Stanford Research Facility***: We are currently exploring a possible joint laboratory research facility on the VA campus. There are many advantages to this and while this is preliminary, we hope that we find a successful way to bring this to fruition. If so, our timeline for completion of this project (potentially a 250,000 gasf building) is 2013-2014.
2. ***1050 Arastradero*** is currently the site for interim location of the Institute for Stem Cell Biology, Cancer and Regenerative Medicine and the Neuroscience Institute. We have a 15-year (renewable) lease on this facility and have invested considerable funds in renovating it as a wet-lab research facility. We anticipate that we will continue to use this facility for program development once its current and immediate occupants move to SIM1, once it is completed.
3. ***855 and 975 California Avenue*** are currently sites for Genome sequencing cores and related activities. These are important facilities, and we are exploring whether they will continue to be housed on this site or in other facilities under development.
4. ***3155 Porter Avenue*** is also a site on which the School has leased space for animal care – now in support of investigators at Arastradero but potentially to develop other core services as well. We will also explore housing other programs at this site depending on space availability.

North Campus and Other Community Sites

We are currently working with both SHC and the University regarding a site in Redwood City now referred to as the North Campus. These plans will unfold over the next 2-5 years.

1. ***SHC/School of Medicine North Campus Facility***: SHC has purchased four buildings previously owned by the company Excite @ Home and is currently renovating three of them for clinical programs being developed in conjunction with the School of Medicine. The planned opening of this facility is early 2008. It will house Centers for Orthopedics, Spine Care, Dermatology, Pain Management and Sleep Medicine. Imaging and ambulatory surgery will be available at the North Campus, and it is designed to provide state of the art ambulatory care in an attractive and patient friendly environment.

2. ***University/School of Medicine North Campus Facility:*** The University has purchased approximately 30 acres of land proximate to the SHC site and is currently exploring the development of the Stanford North Campus, which will house a variety of administrative and, potentially, research and education programs. We are currently collaborating with the University about joint programs. As I discussed in the November 6th Newsletter (see: http://deansnewsletter.stanford.edu/archive/11_06_06.html#3) we are currently exploring relocation of a number of School administrative functions offsite in anticipation of the development of the North Campus. The off-site alternatives being developed are exciting and will provide very special opportunities for our staff and faculty.

Hospital Planning

Over the past several years both Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) have been deeply involved in future facilities planning based on, among other factors, seismic issues, serious capacity constraints, severe limitations in the number of single occupancy rooms, and an emergency department that is too small and lacks the privacy to provide care to the community. Because the hospitals are both in the City of Palo Alto, renewal or expansion of these important facilities needs approval from the City Council. This process was initiated at the November 20th meeting with the City Council mentioned above. This meeting launched an evaluation and negotiation process that will unfold over the next couple of years. Some of the key issues presented to the City Council are as follows:

Stanford Hospital & Clinics Master Facilities Plan 2006

Since 1959, SHC has been providing state-of-the-art healthcare for Palo Alto and the surrounding communities. Originally constructed as a joint teaching hospital and City of Palo Alto community hospital, SHC is currently licensed by the state of California to operate 613 beds, but is currently operating at about a 460-bed level. Its projected need, in order to viably meet current and future demand, requires an increase of 140 beds, for a total of 600 beds. In order to meet this bed count and provide for the other issues identified above, SHC proposes the following:

New construction:

- 1,100,000 gross square feet to house the replacement of 456 beds, new surgical operating suites, new diagnostic and treatment suites (MRI, CT, etc.), and associated nursing and support space
- 329,000 gross square feet to house clinics, medical offices, and administrative offices
- Parking for 695 cars
- Parking Structure for 700 existing cars to replace existing Parking Structure #3 (700 cars)

Reuse of existing facilities:

- Renovation of D, E, & F nursing units, which currently house 243 hospital beds, to house about 144 SHC hospital beds and support space
- Reuse of the remaining 1989 HMP building to house diagnostic and treatment space and other supporting functions such as materials management, clinical laboratory, and physician and administrative offices

Demolition of existing facilities:

- Demolition of 441,900 sf of existing 1959 hospital facilities (East Building, West Building, Core Building, and Boswell Clinics Building) after construction of a new clinical building
- Demolition of 216,400 sf of the existing 1973 building after construction of a new clinical building
- Demolition of existing 700-car Parking Structure #3
- Demolition of existing 1101 Welch Road structures totaling 41,100 square feet.
-

Summary of square feet (not including parking):

Based on the current data, approximately 1,429,000 square feet of new construction would take place along with approximately 699,400 square feet of demolitions, for a total net addition of 729,600 square feet.

Lucile Packard Children's Hospital Master Facilities Plan 2006

Occupied in 1991, the existing LPCH facility requires expansion to serve additional children and families and to accommodate contemporary healthcare standards. LPCH is currently licensed for 257 beds on its campus and plans to increase its license by 104 beds to 361. The proposed addition will allow conversion of existing beds from semi-private to private rooms in the existing facility and reuse of space for other diagnostic and clinical purposes. LPCH will continue to occupy two floors in the F Pod nursing unit for its Obstetrics program and will also convert rooms in both F Pod and other vacated space to create private patient rooms. LPCH will also continue to share services with SHC for emergency department services and materials management.

New construction:

- 375,000 gross square feet of new addition to house 104 new beds, new surgical operating suites, new diagnostic and treatment suites (MRI, CT, etc.) and associated nursing and support space
- 50,000 gross square feet of new clinics space and supporting services

Reuse of existing facilities:

- Reuse of two floors in F Pod to continue to house the Obstetrics program
- Reuse of main facility to continue to house patient bed, diagnostic and treatment, clinical and support services

Demolition of existing facilities:

- Demolition of existing 703 Welch Road structure of 23,500 square feet. See separate discussion regarding relocation of non-Stanford medical offices.

Summary of square feet (not including parking):

As currently planned there will be approximately 425,000 square feet of new construction along with approximately 23,500 square feet of demolition for a total net addition of 401,500 square feet for the LPCH plan.

The Planning Process and Timelines

This plan represents a bold and ambitious vision for the Medical School and Medical Center that will unfold over the next 15-20 years (or more). I am fully cognizant that we face a number of challenges in bringing this plan to fruition on the timescale we hope will transpire. In addition to the important processes that will unfold in relation to the projects in the City of Palo Alto, we will also need to grapple with limitations in GUP allocation for the remaining projects and, perhaps most importantly, the economic resources to carry them out. Accordingly we have developed a carefully calibrated funding plan. However, it must be recognized that bringing each of its elements together will require precision, careful calibration, appropriate accommodations, dedication and commitment – and of course, a considerable amount of luck or “good fortune.” That said, we are at a critical juncture, and if Stanford is to remain a leading institution for the 21st century, it is imperative that we accomplish these important goals and objectives. As I concluded my comments to the Palo City Council on November 20th, I reminded them that 50 years from now, leaders from the university, medical center and community would look back on what we did to assure that Stanford would remain a world leader in academic medicine. We can do no less than think boldly and thoughtfully and shape the future for the benefit of our community – locally and globally.

Call for Proposals for the Wallace H. Coulter Translational Partners Grant Program at Stanford University

I have received the following announcement from Dr. Paul Yock, The Martha Meier Weiland Professor in the School of Medicine and Professor of Bioengineering and Co-Chair of the Department of Bioengineering. This is a wonderful opportunity for faculty in clinical departments to collaborate with a member of the Department of Bioengineering. I encourage interested faculty to follow up with Dr. Yock or with Dr. Scott Delp, Chair of the Department. Please note that the deadline for submission is January 8, 2007.

The Wallace H. Coulter Translational Partners Grant Program at Stanford University CALL FOR PROPOSALS

Deadline: January 8, 2007

Program: Grants of up to \$100,000 (direct costs) from the Wallace H. Coulter Foundation will support collaborative translational research projects that involve co-investigators from the Department of Bioengineering and a clinical department in the School of Medicine. The goal of this program is

to facilitate collaborative research that addresses unmet clinical needs and leads to improvements in health care and to commercial products. Examples of desirable outcomes include inventions, patents, improved diagnosis and treatment of disease, commercial products, licenses, commercial partnerships and start-up companies.

Criteria: Each proposal must have co-investigators, at least one whose primary salaried appointment (50% or greater) is in the Department of Bioengineering at Stanford University and at least one clinical investigator from a clinical department in the School of Medicine. The Bioengineering faculty member must be full-time, tenure track at the Assistant, Associate or Professor rank. The research must relate directly to applications in health care, and the objectives of the project should include an outcome that will benefit patients. Evaluation of each proposal will be on the basis of scientific merit, potential health care impact and significance, experience of the investigators, and the potential for commercialization and for successfully obtaining further support.

Submission: It is suggested that applicants discuss their proposal with Paul Yock (yock@stanford.edu) or Scott Delp (delp@stanford.edu) before submission. Proposals must be submitted by January 8, 2007 via e-mail to Sandy Miller, sandy.miller@stanford.edu. An Advisory Committee will review the proposals and select finalists for a brief presentation in late February. Applicants will be notified by early March 2007 for funding to begin April 1, 2007.

Duration: Grants will be for a one-year period, and may be submitted for renewal. Renewal applications must have a comparison of milestones achieved vs. those planned in the original submission. Renewal applications will be evaluated on a competitive basis with new applications.

A Job Well Done: Thanking and Honoring Dr. Julie Parsonnet

At the end of this year Dr. Julie Parsonnet, who has served with distinction as Senior Associate Dean for Medical Education for the past five years, will relinquish her decanal responsibilities and return to her important roles as an investigator and clinician. I want to thank Dr. Parsonnet for the extraordinary job she has done in significantly enhancing medical education at Stanford. Thanks to her leadership and the very successful partnership she forged with her colleagues in the Dean's Office, the Faculty Senate, and our students, the New Stanford Curriculum (see: <http://med.stanford.edu/education/>) was implemented in the Fall of 2003 – less than two years after it had been conceptualized. This was a remarkable achievement in its own right. But even more important is the substance of the New Curriculum - Stanford now has a medical curriculum that more closely aligns our students with the faculty and the mission and goals of our school of medicine. We are privileged to attract wonderful students to Stanford, and I am enormously pleased that we can offer them an opportunity to develop a broad and deep

knowledge of the biosciences and their relationship to clinical medicine. Because of the New Curriculum's innovative scholarly concentrations, which provide opportunities to develop deeper analytic knowledge through research, I am confident that Stanford graduates will be even better prepared to become the leaders and transformers of tomorrow.

Coupled with the important leadership role that Dr. Parsonnet played in designing the New Stanford Curriculum, she also helped develop the advising system and has been a champion for improving the lives and personal development of our students. Changes like these do not come easy to individuals or institutions. They require vision, commitment, dedication and true leadership. Dr. Parsonnet exemplifies these qualities, and I am most grateful and appreciative of her all that she has accomplished.

Please join me in thanking and honoring Dr. Julie Parsonnet.

Transitions in Medicine: Thanking Drs. Greenberg and Rizk and Welcoming Dr. Ralph Horwitz

On December 1st Dr. Ralph Horwitz officially began his role as our new Chair of the Department of Medicine. I provided a summary of Dr. Horwitz's academic background in the August 21st Dean's Newsletter (see http://deansnewsletter.stanford.edu/archive/08_21_06.html#1). I am extremely pleased to welcome Dr. Horwitz to Stanford and look forward to working with him. Given his past experience as Chair of Medicine at Yale and, more recently as Dean of the Case Western Reserve School of Medicine, I have every confidence that Dr. Horwitz will be a wonderful and successful leader for many years to come.

At the same time as I welcome Dr. Horwitz I hasten to add that he is inheriting a Department of Medicine that has been significantly improved during the past two years, thanks to the wonderful leadership that Drs. Harry Greenberg and Norm Rizk provided. When I appointed Drs. Rizk and Greenberg to serve as co-chairs, I recognized that their knowledge and skills were complementary, and I anticipated that they would work collaboratively and constructively to address the many challenges the department faced. To say that they exceeded every expectation is a major understatement. Harry and Norm fully committed their notable energies to addressing virtually every challenge or problem the department faced. They recruited key faculty, mentored and supported trainees and faculty, improved financial management and support and, perhaps most importantly, enhanced the morale and well being of all whom they served. In doing so they won the respect of the Department of Medicine as well as the entire Medical School community. I am deeply grateful and indebted to Drs. Greenberg and Rizk for their thoughtful and caring leadership and support of the Department of Medicine.

Interim Leadership for the Lane Library

With the departure of Debra Ketchell (<http://deansnewsletter.stanford.edu/#2>), Heidi Heilemann has been appointed Acting Director of Lane Medical Library & Knowledge

Management Center effective December 16, 2006. Heidi has been an essential member of the Lane staff since 1993 and is currently the Associate Director for Research & Instruction. Many of you already know Heidi from her work as a departmental liaison, instructor for SPCTRM, PRECEPT, and the Stanford Hospital Research Council programs. She is a key participant in strategic planning for the new Learning and Knowledge Center. Over the past two years, Heidi has led the Lane facilities update, reinvented document delivery, redesigned the physical and virtual service desk, and coordinated the 100th Anniversary Celebration. Professionally, she is a member of the Medical Library Association's Academy of Health Information Professionals. Many thanks to Heidi for taking on this important role.

Attention to Bicycle Safety

I have communicated previously about the serious problem of bicycle safety on campus. Despite counseling, admonition and even police enforcement, too few students wear bike helmets or, even more worrisomely, have bike lights at night. My concerns about bike safety are even more heightened now that it gets dark earlier and the rainy season (with more slippery surfaces) will soon be upon us. I ask each of you who ride a bike on campus – or who know someone who does – to pay attention to a few important safety rules:

- Be sure that you have both a front light and a lighted rear reflector (and check your batteries for these lights on a regular basis.
- Wear a bicycle helmet whenever you are riding your bike.
- Approach traffic intersections slowly and carefully and defensively. While bikers believe they see oncoming traffic – and assume that car drivers see them – you should assume that you cannot be seen and that if you cross an intersection without warning, you can easily be struck by an oncoming vehicle.
- Be aware that leaves and other roadside debris (especially with all the construction currently underway on campus), especially when wet, results in serious slip hazards.

I hope you will be as cautious as possible – and encourage other cyclists to also be responsible riders. You can find helpful tips on bike safety at http://facilities.stanford.edu/transportation/alt_transportation/BikingAtStanford.shtml

Awards and Honors

Dr. Patrick Brown, Professor of Biochemistry and Investigator for the Howard Hughes Medical Institute of Biochemistry, has been awarded the American Cancer Society's Medal of Honor, the organization's highest honor, for his contributions to cancer research. Specifically the award recognizes Brown's development of low-cost, accessible automated micro arrays and his life-saving contributions to the field of functional genomics. Congratulations to Patrick.

Appointments and Promotions

Karlene Cimprich has been promoted to Associate Professor of Chemical and Systems Biology, effective 12/1/06.

Ralph Horowitz has been appointed to Professor of Medicine, effective 12/1/06.

Maurice M. Ohayon has been promoted to Professor (Research) of Psychiatry and Behavioral Sciences, effective 12/1/06.

Greg Zaharchuk has been appointed to Assistant Professor of Radiology, effective 12/1/06.

Dean's Newsletter December 18, 2006

2006: A Year to Remember

Of course every year is memorable - but some are simply more so, and 2006 has to be considered among the best of those. For Stanford Medical School this past year has been one of affirmation of our legacy and missions, evidence of institutional excellence and leadership, and continued evolution and development toward a more successful future. Our Office of Communications and Public Affairs has summarized some of the most noteworthy stories of the year (see:

<http://mednews.stanford.edu/releases/2006/december/year-review.html>) but I would like to highlight some themes that I think are particularly important.

It is easy to forget how young a school of medicine we are – especially if we use 1959 as the benchmark for our true beginning as a research-intensive medical school. Our short history underscores how far we have come – but also makes clear the distance yet to travel. 2006 was my fifth year anniversary as dean, and from this vantage point I can see how much more defined we are in our mission and resolve (compared, of course, to the days of uncertainty surrounding the failed merger with UCSF, which antedated my arrival), but also how difficult change can be for institutions and individuals when it challenges conventional organizational constructs. And yet, without change we are vulnerable to losing our creative edge as well as the pioneering and entrepreneurial spirit that has played such an important role in our history.

An Affirmation of Our Legacy

Certainly the numerous awards, honors and recognitions that our faculty and students have received are one of the most wonderful features of 2006. Among these of course, the two new Nobel Prizes awarded to School of Medicine faculty (Roger Kornberg in Chemistry and Andy Fire in Medicine/Physiology) stand at the acme of institutional excellence. While the scientific achievements of Andy Fire (which was largely done at

the Carnegie Institution prior to his recruitment to Stanford three years ago) and Roger Kornberg (whose work was done virtually exclusively at Stanford) are testimony to individual brilliance and creativity, we all share in the glory of their recognition. In fact, I had the privilege and pleasure of attending the Nobel Ceremonies honoring this year's Laureates and, in fact, write these comments from Stockholm. Interestingly, one of the frequent discussions I have had with colleagues from various Swedish Universities – and particularly Uppsala and Lund – has been about what contributes to America's and, in particular, Stanford's success in having a disproportionate share of Nobel Prize winners. While any response is best viewed as speculative, a couple of observations seem relevant.

One important factor has been the support for science by our nation – especially from the National Institutes of Health, National Science Foundation and other federal agencies, along with support from numerous private foundations and philanthropists. Much of this support has occurred during the past 4-5 decades and it has propelled science in the USA to the forefront of global excellence. Without this commitment it is impossible to imagine that we could have sustained such excellence, which is further evidenced by the fact that each of the Nobel Prizes in the sciences this year went to Americans. In addition to funding and the resources such funding purchases, a key factor resides in the individual and the setting. The ability for scientists to carry out bold and creative work requires a supportive and intellectually robust environment – something that I think is clearly part of the Stanford milieu. Additional factors include choosing the best faculty – something that Stanford does quite well – and then giving them the resources and time to be successful.

Time is among the most important of these factors and obviously must be balanced against the various competing demands that exist in universities and academic medical centers. I would also add that creative and innovative science is enhanced by research groups that are relatively small and highly interactive and that are part of a community of excellence (as compared to more applied research or “big science,” which is less likely to make seminal discoveries). Again, this mix of creative people, resources, and environmental factors along with a culture that values intellectual achievement is well established at Stanford, and I anticipate that in the years ahead, this will be evidenced by additional Nobelists and other major award winners. Perhaps most importantly, it is our commitment to basic discovery, science, innovation and inquiry that fosters a setting that we deeply value and so want to see sustained and enhanced.

It is hard to describe the Nobel Ceremonies without referring to “Pomp and Circumstance.” But here I think the two terms are appropriately connected, in contrast, say, to one of my former institutions where there often seemed to be “pomp” without circumstance or, to be honest, at Stanford where there is not infrequently “circumstance” without the pomp! But the Swedish Academy and the Nobel Committee had the linkages perfected.

What is perhaps most memorable about the Nobel ceremonies is that they celebrate the accomplishment of the intellect and creativity – and thus affirm what is most significant about humanity. Moreover, the ceremonies take place over days, with rising and ebbing

waves of emotion and fanfare. The agenda for each of the Nobelists appeared daunting and unique (see: <http://mednews.stanford.edu/nobel-ceremony/>) although some common touch points occurred for common celebration. Among these were the Nobel Lectures given on Friday, December 8th where Roger and Andy each delivered 45- minute reviews of their work, which were highly informative and inspirational. The Nobel Prize Award Ceremony occurred on Sunday, December 10th in the Concert Hall in the presence of an invitation- only audience, most of whom were dressed in white tie formal tuxedos or long gowns. The Royal Stockholm Orchestra played pieces by Mozart, Haydn, Shostakovich, Faure and Kraus to punctuate the presentation of each Laureates work and to provide the introduction of King Carl XVI Gustaf, who presented the award. It was an ebullient and emotional experience and I was certainly proud to witness the acclamation of our colleagues and of Stanford. The Nobel Banquet, which was held in the “Blue Hall” of the City Hall, followed this event – a remarkably festive setting that accommodated over 1300 invited guests. It began at about 7 PM with dinner; entertainment and speeches ended around 11 PM and were followed by dancing in the Gold Hall. I must confess that I escaped the dancing, along with President Hennessy and Mrs. Helen Bing, who were also in attendance.

Perhaps most importantly, these events were a time for true celebration by the family members and colleagues who accompanied Roger and Andy to Stockholm to share in the ceremonies and festivities.

I also want to personally thank Professor Emeritus Stig Hagstrom, who worked with the Nobel Committee to arrange my visit to Stockholm for the ceremonies. He promised it would be a unique experience and he was certainly correct. Truly “Pomp and Circumstance” – and most appropriately so!

The Stanford Challenge

I have written previously about the launch of the Stanford Challenge and the important role that School of Medicine will play in it along with our colleagues across the university (see <http://med.stanford.edu/development/challenge/> and http://deansnewsletter.stanford.edu/archive/10_23_06.html#1). There is little question that our success in achieving the goals of the Stanford Challenge in its key areas of Human Health, the Energy and the Environment, and the International Initiative, will shape our university for many years to come. The fact that a major focus of our effort is to ask how Stanford can more positively impact the world we live in has captured attention from colleagues around the world, as I learned in meeting with faculty and university leaders in Uppsala and Lund during my visit to Sweden.

Translating Discoveries: Five Years Later

Just as our commitment to basic science has and will hopefully continue to support innovation and discovery, our commitment to improving the outcome of patients facing the challenge of serious disease is addressed by our mission in ***Translating Discoveries***. These two primary goals – basic discovery and translating discoveries – are linked by opportunity and while each exists separately, it is the touch points that will help to make us unique. Building on the work of the past several years, we have now established an

alignment of our missions in education, research and patient care that will continue to define an important aspect of our future. Bringing School of Medicine basic and clinical scientists together for discovery, sharing and collaboration is further enhanced when they are joined by faculty and students from across the university – a goal that is fostered by the continued development of our Stanford Institutes of Medicine. We have spent considerable effort addressing the very practical issues of how the Stanford Institutes of Medicine will positively relate to our Departments so as to enhance the missions of both. This has been codified into a working set of Institute Guidelines that we will surely refine with future experience but which are now available for review on our website: <http://med.stanford.edu/institutes/guidelines.pdf>

Importantly, this past year has also been associated with success in our application to the National Cancer Center to receive NCI designation (details forthcoming) as well as in our recognition as a Ludwig Cancer Center. We have achieved substantial philanthropic and foundation support to help support these efforts and can now also look forward to support from the California Institute for Regenerative Medicine to support our Stem Cell Institute investigators during the next year. Strides are also being made in the Immunology/Transplant/Infection Institute in setting up a unique Immune Monitoring Center and in better defining the roles for the Neuroscience and Cardiovascular Institutes. That said, considerable work remains, but I am highly encouraged by the commitment of our leaders and faculty to moving our agenda forward. Surely these efforts will be further enhanced by the infrastructure support for translational research now coming through SPCTRM and that will hopefully emanate from our application to the NIH for a CTSA (Clinical and Translational Science Award) that will be submitted in mid-January.

Of course the ability to carry out truly exciting work in discovery and translation requires programmatic resources as well as physical facilities. The latter are essential since the lack of space for our missions in education, research and patient care is one of our most significant challenges. We have laid out a bold plan for addressing this in both the near and the long-term future that I discussed in my last Newsletter (see: <http://deansnewsletter.stanford.edu/>) but it will take considerable investment, support and time to bring this to fruition. I am committed to continue to do all that I can to help facilitate this – but I will also be counting on your support and efforts as well.

Federal Support for Biomedical Research

Over the last two years I have written several updates on proposed legislation to reauthorize the National Institutes of Health (NIH). Last week, after two years of discussion and negotiation, Congress passed compromise legislation entitled the National Institutes of Health Reform Act of 2006.

As many of you know, reauthorization legislation consists of a broad-based policy review that often mandates significant changes for a federal agency or program. Most federal agencies and programs are reauthorized every three to five years and in some cases on an annual basis. Partly due to NIH's historic congressional support and partly due to concerns that any NIH bill could raise a host of controversial issues, Congress had not reauthorized the agency in over 13 years.

However, responding to federal budgetary constraints, and in follow-up to the 2003 Institute of Medicine report entitled, *“Enhancing the Vitality of the National Institutes of Health—Organizational Change to Meet New Challenges,”* the House Committee on Energy and Commerce set NIH reauthorization as one of its highest priorities. As I have described in previous Newsletters, the committee’s stated goals were to enhance the NIH’s ability to develop and encourage research planning across the NIH, to strengthen the NIH Director’s ability to coordinate the agency’s research portfolio, and to direct the development of standardized reporting and data collection to promote greater accountability to Congress and the public.

From the outset I felt it was extremely important for the academic community to actively engage with Congress to ensure that any proposed organizational and funding changes would strengthen, rather than impede, the NIH’s ability to carry out its mission. Accordingly I co-chaired the Association of American Medical Colleges’ (AAMC) NIH Reauthorization Task Force with Bob Kelch from the University of Michigan. This task force played an active role in improving this legislation over time.

The following is a brief summary of the key points of the National Institutes of Health Reform Act of 2006. The legislation:

- * Authorizes a 7% overall NIH funding increase for fiscal year 2007, 8% funding increase for fiscal year 2008 and “funding levels as deemed necessary” in fiscal year 2009.

It is important to understand that the authorization of funding is looked upon in Congress as a recommendation. While these levels constitute a more favorable outcome than the Committee’s original proposal of 5% per year over three years, many budget analysts believe that actual funding will be at a level below the rate of inflation—approximately 4%. Nonetheless this approved authorization level will strengthen the negotiating stance of those who are advocating for increased funding.

- Establishes an “NIH Common Fund.” The committee’s intent is that this new funding mechanism will spur more “trans-NIH” research that will involve extensive collaboration between individual Institutes and Centers. Support from this fund would be awarded on a peer-reviewed basis.

The committee’s most recent proposal to finance the fund through a contribution of 50% of NIH’s incremental funding increases over the next three fiscal years was deleted from the legislation. After extensive negotiation, the bill requires no mandated level of yearly funding increases to build the common fund. Such decisions will be handled in the annual budget process.

In addition, during this process I along with others raised strong concerns about the impact on R01s and young scientists. After considerable advocacy, provisions

were included to preserve an emphasis on investigator-initiated grants and to give consideration to first time investigators.

- * Creates the Division for Strategic Planning and Portfolio Management within the Office of the Director that would be tasked with developing broad based, trans-NIH planning for the agency.
- * Establishes a "Scientific Management Review Group" tasked with reviewing and making recommendations regarding the organization structure at the NIH. The group would include Institute and Center Directors and outside scientific experts. A mandated review will take place once every seven years. Any significant reorganization recommendations would still require congressional approval.
- * Puts in place uniform reporting requirements and improved data collection across the NIH to improve transparency.
- * Limits the overall size of NIH to the existing 27 Institutes and Centers.

Although I have previously expressed my concerns about the impact that some of these structural changes may have during a period of flat budgets, I should note that this compromise is a far cry from the House Committee's original draft. Given how much the bill has improved, I believe that the final legislation is a reasonable compromise that moves forward in the spirit of the consensus recommendations of the IOM report while guarding against drastic change during a tough budget period. I also believe that at a time of political change in Washington it is beneficial to put the reauthorization process behind us and focus on the need to bolster long term research funding. If you have any questions regarding this issue, please don't hesitate to contact Ryan Adesnik, our Director of Federal Relations at radesnik@stanford.edu

Even though the NIH reauthorization now seems less damaging than it did just a few months ago, this remains a very challenging funding climate, and we have considerable work to do to help improve the future funding by the NIH and to also find alternate funding sources for biomedical research. This will require considerable advocacy by all of us in the years ahead.

Building the Future

More important than bricks and mortar are finding, recruiting and supporting the individuals who will make Stanford great during the years to come. These are the students, trainees, faculty and staff who bring excellence to our community and who strive to do the very best they possibly can to enhance our missions in education, research and patient care. During the past year we again admitted an outstanding class of MD and PhD students and are already in the midst of selecting students for the 2007 incoming class. We also recruited 67 new faculty members, the majority in clinical departments although all with strong academic and research backgrounds. Of these 72% are Assistant Professors, which is terrific news for renewing our future faculty workforce. Among this group were also six outstanding Professors and three Department Chairs. Without

question, our future truly depends on our ability to recruit and retain future investigators, educators, and clinicians.

Diversity Faculty Fellowship Program 2007

One of our major ongoing goals is to improve the diversity and leadership among our faculty. With that in mind the Office of Diversity and Leadership is announcing the 2007 Diversity Faculty Fellowship Program. This program, modeled after the Center of Excellence Faculty Fellowship Program, is directed at enhancing the diversity (broadly defined) of the faculty of the School of Medicine by supporting the development of assistant professors who contribute to such diversity. The Diversity Faculty Fellowship Program will provide faculty fellows with salary support for six months (up to a maximum of \$25,000), \$1,000 travel funds, faculty development workshops, and career mentoring. The intent of the fellowship is to enhance the research productivity of junior faculty in order to advance their progress towards promotion.

Five fellowships will be offered for this academic year. Interested faculty should contact their Department Chairs to be nominated. Potential nominees must submit to their chairs a six- month research plan that defines their research activity for the fellowship period. Department chairs should send their nominations along with their nominees' research plans, approved by their division chiefs, if applicable, and by the chairs, to Dr. Hannah Valentine by January 31, 2007. Fellows will be announced February 18, 2007, and funding will be available March 1, 2007.

Learning from Each Other

Our education about the impact of disease comes in many forms. One of the most powerful of these is from the experience of a family member or friend who has encountered a serious health problem. It takes courage to discuss the impact of illness more publicly and especially in a written format. Accordingly, I want to thank Ms. Suzanne Bethard from our Office of Student Affairs for her thoughtful and compelling article entitled "Taking My Poison" that appeared in the December 13th issue of JAMA (2006; 296: 2657-2657) and which can be accessed at <http://jama.ama-assn.org/cgi/reprint/296/22/2657>. I strongly recommend that you read this article and I thank Ms. Bethard for sharing her very personal experience with us.

Wishing You Well for the Holidays

This is the last Newsletter for 2006, and it joins the 136 previous Dean's Newsletters that I have published since my arrival in April 2001. During that time I have had the opportunity to interact with many of you, and my admiration for all that you continue to do – on behalf of science and medicine – continues to soar. I hope that you and your families have a wonderful holiday season and that you celebrate your own accomplishments and how they contribute to improving the community we each live and work in. I look forward to seeing you in 2007 – and yes, the 138th Newsletter will come out on January 15th!

Awards and Honors

Dr. David Relman, Associate Professor of Medicine (Infectious Diseases and Geographic Medicine) and of Microbiology and Immunology has been selected as one of the recipients of Distinguished Clinical Scientist Award for Excellence in "Bench to Bedside" Research. Dr. Relman will receive \$1.5 million over 5 years. Congratulations Dr. Relman!

Appointments and Promotions

Euan A. Ashley has been appointed to Assistant Professor of Medicine (Cardiovascular Medicine), effective 12/1/2006.

Tandy Aye has been appointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 12/1/2006.

Nikolas Blevins has been promoted to Associate Professor of Otolaryngology (Head and Neck Surgery), effective 12/1/06.

Helen Bronte-Stewart has been promoted to Associate Professor of Neurology and Neurological Sciences and, by courtesy, of Neurosurgery, effective 12/1/06.

Thomas A. Burdon has been promoted to Professor of Cardiothoracic Surgery at the Veterans Affairs Palo Alto Health Care System, effective 12/1/06.

Bertha H. Chen has been promoted to Associate Professor of Obstetrics and Gynecology, effective 12/1/06.

Markus W. Convert has been appointed to Assistant Professor of Bioengineering, effective 1/1/2007.

Anthony G. Doufas has been appointed to Associate Professor of Anesthesia, effective 12/1/2006.

Lorry R. Frankel has been promoted to Professor of Pediatrics (Critical Care) at the Lucile Salter Packard Children's Hospital, effective 12/1/06.

William T. Kuo has been appointed to Assistant Professor of Radiology, effective 12/1/2006.

Deirdre J. Lyell has been reappointed to Assistant Professor of Obstetrics and Gynecology, effective 1/1/2007.

Lawrence H. Mathers has been appointed to Professor (Teaching) of Pediatrics and of Surgery, effective 12/1/06.

Marilyn A. Winkleby has been promoted to Professor (Research) of Medicine, effective 12/1/06.

Dean's Newsletter

January 15, 2007

Planning For The Future

Six years ago, before I officially arrived at Stanford, I began the strategic planning that helps shape our agenda for *Translating Discoveries*. Most importantly, an integrated planning process that includes basic and clinical science faculty as well as students and staff has guided our subsequent planning and program development during the past several years and has made it more embracing, interactive and successful. While it is understandable that as individuals or groups we have a view and opinion about what is most important for Stanford, it is important to note that we have found ways to have a dialogue that considers shared goals and objectives and that sets priorities for how to achieve or fulfill them. This process has continued to evolve over the years, and in three weeks we will take yet another step when our department chairs, institute and center directors as well as students, fellows, staff and colleagues from our hospitals and university community assemble for the 2007 Strategic Planning Leadership that will be held February 1st-3rd. This will be another opportunity to test and challenge some of our assumptions and also to ask some of the big and important questions facing academic medical centers in general, and Stanford specifically. I will have more to say about the Retreat in subsequent Newsletters. In the interim, I want to convey some of my thoughts about a number of the major issues and challenges we face as we continue our journey with the Stanford School of Medicine and Medical Center. While this is hardly a complete listing, I believe it is important to share some of these thoughts with you – both for your information and also with the hope that you might offer some of your own thoughts and suggestions to me as well.

Education

At a university we generally think of students as those who are pursuing a specific degree. However at an academic medical center, our students and trainees are much larger in number and include, in addition to degree-seeking students, residents, clinical and research fellows. Taken together we have nearly 3,000 individuals who have come to Stanford for a degree, a certificate or the opportunity to work with one of our faculty. We are a small school of medicine in comparison to our peers, and our full-time faculty has numerous obligations to medical school and hospital teaching – including a number of undergraduate courses and educational programs. And while this is one of our most important missions, there is often no direct payment for teaching, and the time demands for research and patient care, as well as other professional and personal obligations, continue to provide competing challenges. In fact, I would argue that allocating and protecting time for education and teaching is one of the most important responsibilities – and challenges – we face during the years ahead.

Medical Student Education: We continue to be fortunate in attracting outstanding students to join our medical school class. Since the introduction of the New Stanford Curriculum in 2003, with its focus on integrating basic science and clinical medicine and its requirement that all students must pursue a scholarly concentration, we have noted an improved alignment between our mission and goals and those of our students. In tandem with the continued evolution of the curriculum, we have also spent considerable effort in improving the advising system and in forging additional opportunities for students to benefit from the chance to engage in research and scholarship.

Going forward, we have further work to do to assure that each aspect of the curriculum is as excellent and engaging as possible. A particular challenge is the clinical rotations, which are not as uniformly excellent as I would like at this juncture, and which remain challenged by the time pressures facing many of our clinical faculty. Some of these pressures may be alleviated when the Learning and Knowledge Center is completed and robotics, virtual reality and simulation technologies provide new efficiencies. However, we are likely to continue facing the challenge of balancing the expectation of our faculty to deliver outstanding patient care with their role in clinical education and training – not only of medical students but also of residents and clinical fellows. Importantly, we also need to pay particular attention to developing and championing our students' skills in compassion and humanism and to value these as much as we do scientific and medical knowledge and technical proficiency

I, along with others, believe that we also need to do a better job of integrating a culture of professionalism into the education and training of our students and to make certain that these values are both inculcated and valued by our community of students and faculty. The bottom line is that we need a higher degree of accountability in our shared commitment to professionalism.

I also continue to be concerned that we need to be more rigorous in our evaluation of courses, interactions and each other. While I do not believe that it is necessary to introduce a traditional grading system, especially during the preclinical years, I do think we need to conduct student and faculty evaluations during clinical rotations in a more robust manner– and to hold to the highest possible standards of excellence.

During the next year we will be making decisions about whether to increase the size of our incoming medical school class. While many medical schools are exploring increases in class size from 15-30%, I do not share the view that such broad increments are needed without first addressing other important limitations of the health care system. Nonetheless, I do envision more modest increases in the number of incoming medical students at Stanford – perhaps from 86 to 100 new medical students each year. In doing so, we would sustain our focus on educating and training future physician leaders, scholars and investigators – something I believe we can do uniquely well at Stanford.

Graduate Student Education. As you likely know we have approximately equal numbers of students pursuing PhDs as MD degrees. We also have an increasing number of

students who are seeking dual degrees – and this is something we are fostering and promoting as a way of enhancing the unique potential of our students.

Appropriately, while the majority of our graduate students will continue to pursue careers in academia, many also ultimately seek opportunities in industry, education, public service or other venues. Creating options is the key. At Stanford we have both departmental based and interdepartmental degree programs. While these programs are successful, it is appropriate to consider how they can be further optimized, especially by greater interactions with programs across the university. We must also critically assess whether joint degree programs enhance or dilute the educational experience of our students. Further, we need to continue to assess whether our current programs optimize the opportunities and flexibility for our students to choose areas of study that differ from those that may have brought them to Stanford in the first place.

This past Fall we introduced a new program leading to a Master in Medicine degree to introduce graduate students to the challenges of clinical medicine with the goal of developing a cadre of basic scientists who are better poised to address fundamental problems in translational medicine and research. While we anticipate that this will serve only a subset of our graduate students, it does offer an opportunity to create further alignments between our basic and clinical science faculty and between the medical school and its clinical programs.

For all of our graduate programs, the cost of education is rising as financial support from the NIH and major foundations is declining. Clearly this is an important challenge that requires new approaches, including philanthropy, in order to assure that we can sustain these excellent programs into the future. We must, of course, address these challenges if we are to sustain our leadership in graduate education.

Postgraduate Education. Among the most important members of our academic medical center are our clinical and research fellows. While these individuals often play key roles in research and clinical programs, they rarely get the credit or accolades they deserve for the important clinical and scientific work they conduct. This is something we need to address. Indeed, without our fellows and postdocs, none of our programs would be as robust, vibrant or successful as they are. Despite the fact that fellows and postdocs represent the largest number of trainees in the medical school and medical center, their personal orbits tend to be around specific faculty or programs rather than with broader departments or the school. We need to find ways to better recognize - and support - our fellow and postdoc community. In addition to the professional challenges faced by fellows and postdocs, the long years of training and low levels of compensation impose a significant personal burden. I recognize that this is not easy to solve given all of our financial constraints – but we must continue to do all we can to help address this challenge.

In addition, we need to address the compartmentalization of our undergraduate and postgraduate clinical training programs. Sustenance of an academic underpinning to clinical training is essential but harder to achieve in the current climate which imposes

increased demands on residents and fellows and also limits their work time (albeit to 80 hours per week). It is my hope that we can create better alignments between our medical school curriculum, with its research opportunities, and the training and education of residents and fellows. To help address this I am creating the new position of Senior Associate Dean of Graduate Education, who will work closely with the Senior Associate Dean for Medical Education (now Charles Prober, who has replaced Julie Parsonnet in this role) and Senior Associate Dean for Graduate Education (now John Pringle). I am very pleased that Dr. Myriam Curet, Professor of Surgery, has agreed to take on this important role and will officially begin her work this April.

Continuing Medical Education. A number of leading medical schools and centers have nationally recognized programs in continuing medical education (CME). For a number of reasons I don't believe that Stanford is among them. Certainly we do have a number of distinguished department based programs but, for the most part, we have not excelled in CME. Last year we commissioned a task force to critically assess our CME programs. Based on the excellent and critical analysis this group conducted, it is clear that we have considerable work to do. Importantly, unlike our most successful peers in CME, we do not have a centrally coordinated effort with the appropriate standards and services. In fact, we now have a highly dispersed set of programs lacking central oversight or coordination across the Medical Center. That needs to change lest we fall even further behind in providing highly regarded programs in continuing medical education for the school and affiliated hospitals. In the near future I will be announcing how some of these changes will become actualized.

Research

Enhancing Basic Research. There can be no question that the fundamental basis for Stanford's excellence as a medical school resides in our longstanding commitment to basic inquiry and to the superb faculty who have carried out basic research during the past decades. We are fortunate to have had an outstanding basic science community, and I am pleased that we have continued to recruit – and retain – an outstanding faculty. As a nation the United States has been a world leader in biomedical research, and, while that prominence is still sustained, we are all concerned that it is now challenged by the decline in funding from the NIH. There is hardly a faculty member who has not been touched by the current negative funding climate – or who does not have anxiety about its consequences. I have written frequently about this in the past and have also relayed some of the advocacy activities we have been carrying out to address the problem.

There are a number of converging factors to reconcile: a decrease in the funds available for the investigator initiated pool (i.e., RO1) that is manifested by fewer outstandingly scored research proposals being funded. At the same time the NIH – and a number of foundations – has put a greater emphasis on more applied and translational research. I do not doubt the importance of this latter research, but we must raise serious concerns when it compromises fundamental investigation. While we need a balance, and while so-called big science can move fields with an alacrity that exceeds that of an investigator or even an institution, it is important to underscore that the most important and truly paradigm shifting discoveries have been done by single or small groups of investigators pursuing

creative ideas. Thus we need to do all we can to preserve and indeed enhance our commitment to basic science research – and I am fully committed to doing so. While we all recognize that the funding climate is difficult, we need to engage our collective creativity to help Stanford overcome the perceived barriers and leap forward. This will likely require different ways of funding research and even rethinking the settings in which it is conducted. And while I don't want to minimize the challenges that lie ahead, I do think that we will find ways to succeed as we work together on this issue – not only within Stanford but also with our colleagues at other medical schools and universities as well as with those in biotechnology and industry – as we make the case for innovation (and the funding required to foster it) to state and federal government leaders.

Promoting Translational and Interdisciplinary Research. In tandem with support for basic science research and the recognition that the innovations and technologies we are able to translate today emanate from basic discoveries made years or even decades ago, we also need to be proactive in pursuing translational medicine. Indeed, translational medicine has been central to our overarching mission, and I believe it can further distinguish Stanford as a medical school and medical center. During the past several years we have taken a number of steps to further facilitate our success in translating discoveries. These include the creation and development of the Stanford Institutes of Medicine, our pursuit of becoming an NCI-designated Cancer Center, the provision of a number of pilot awards and grants to stimulate innovation and translational research – through the School as well as Bio-X – and the development of the infrastructure to support translational research, including SPCTRM and the Jill and John Freidenrich Center for Translational Medicine. During the week ahead we will take another major step as Dr. Harry Greenberg sends off the 741-page Clinical and Translational Science Award (CTSA) proposal that he and a number of other faculty have been working on during the past year. This is a major initiative, and, if we are successful, it will have a transforming impact on Stanford. As with other programs we have been developing, our interconnection and alignments within the school and across the university serve as a truly distinguishing hallmark of our CTSA application.

Patient Care

Improving Patient Care. Our mission in patient care is what separates and distinguishes us from the other six schools at Stanford. Since I have been at Stanford, a number of clinical programs have grown or have been developed, thanks to the outstanding leadership of the clinical chairs, both those who have been newly recruited and those who were already part of the school's leadership when I arrived. Indeed, the depth and excellence of many programs have increased enormously, and as a result of their success, we are now challenged by serious capacity constraints at Stanford Hospital & Clinics (SHC) as well as at the Lucile Packard Children's Hospital (LPCH). I am quite aware that many of our faculty are working enormously hard in providing patient care – while still trying to sustain their research and education obligations as they endeavor to succeed in academic promotion or careers. Having myself continued to be part of the clinical care service, even if for a limited amount of time, I have observed directly the significant pressures, time demands and resource challenges our faculty face virtually every day.

Moreover, over time, the acuity and complexity of the patients coming to SHC and LPCH have increased – and are likely to continue doing so in the immediate future.

It is also clear that we will be increasingly judged in our clinical performance and that we will be compared to other academic medical centers as well as community hospitals in the perceived quality of the patient care we provide. In fact, reimbursements for clinical service, modeled on the pay for service programs being instituted through Medicare, will be linked to quality measures. Moreover, reporting of comparative quality measures will be public – a trend that has already commenced and that will become further standardized in the years ahead. Accordingly, we must do everything we can (which means more than we are now doing) to foster and stimulate a climate of commitment and accountability to provide the highest quality care for patients. While I recognize that virtually every physician believes that she or he is already doing this, I fully expect that, when we are assessed and compared to each other and to peer institutions, areas of deficiency will be identified. While this may be understandable to some, it is not acceptable, and we need to have the highest level of commitment – from the community of faculty, physicians, and administrative leaders – to continuously assess and improve the quality of patient care and service we are providing. To help address this, Martha Marsh, President and CEO of SHC, and I have recently appointed a leadership committee led by Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, and Dr. Kevin Tabb (Chief Quality and Medical Information Officer for SHC) to make this both an institutional priority and a continuous improvement effort. Similar efforts have been underway at LPCH during the past several years, and they have led to highly successful achievements – which also clearly need to be sustained.

In looking forward, among the biggest challenges we will face in patient care delivery will be the capacity and resource constraints at SHC and LPCH. Both facilities are now nearly always filled to capacity, and limitations in their respective physical plants are becoming ever more apparent. While I am hopeful that these will be addressed by the hospital replacement plans that I shared with you in my December 4th Newsletter (see: http://deansnewsletter.stanford.edu/archive/12_04_06.html#1i), the timeline for completion of these important projects is measured in years (if not decades), and thus the pressures will remain significant for the foreseeable future. While moving some clinical services to new offsite facilities, such as the North Campus in Redwood City, will help, we will continue to face significant pressures and limitations for many years to come. This underscores the need to plan continuously for service improvements that optimize efficiency as well as quality and patient satisfaction. Clearly these are very big challenges, and they will be made even more so by the funding climate facing hospitals and medical centers and the increasing cost for construction and program development. These factors highlight even more clearly the need to work closely and collaboratively with our hospital leaders and colleagues across the Stanford University Medical Center.

Linking Research to Patient Care. In addition to providing the highest quality patient care and service, one of the factors that will most distinguish Stanford from peer institutions will be the availability of novel and innovative treatments and disease prevention strategies. This is one of the reasons why “*Translating Discoveries*” is so important to

the future success of Stanford Medicine. Indeed, in the absence of a commitment to research and education, even state-of-the-art clinical programs become obsolete – or undistinguished – in just a handful of years. Without question, what distinguishes academic medical centers, including Stanford, is the quality of discovery – and ultimately its application to improving patient care. Similarly, training and educating future generations of physicians and scientists also impact the reputation and excellence of academic medical centers and teaching hospitals. Stanford clearly excels in these areas – but sustaining these programs is challenging, especially when resources become constrained. That said, what will ultimately distinguish success from mediocrity is our broad institutional priority to ensuring that our academic and clinical programs are well aligned.

From an organizational perspective, we have linked our five Stanford Institutes of Medicine with the clinical centers of excellence at SHC and LPCH. This also helps to connect research and clinical leaders and to optimize ways to enhance and facilitate the communications between clinical and basic science investigators and educators. Indeed, without continued proactive efforts, it would be natural to expect the research and clinical care communities to diverge, given the limitation of resources and the demands on time they each face, albeit for different reasons. Thus, thoughtful efforts are necessary to create pathways for communication and also opportunities for collaboration, so that knowledge can be successfully transferred – and career development appropriately achieved.

For example, clinical faculty cannot be successful as investigators or as educators if they do not have the time to carry out these activities. As increased demands for clinical service consume greater amounts of faculty time, and as clinical research or teaching become unfunded or under-funded mandates, sustaining linkages between academic and clinical opportunities becomes challenged. When not addressed proactively, clinical demands can swamp the time available for scholarship and research and lead to dissatisfaction or the inability to meet the criteria for promotion. This outcome can lead to problems in retention and to lost opportunities – for the individual and the institution - and thus represents an issue that we need to continue to work on. Of course, the bottom line is determining who can pay for or support these activities and, in making that determination, who is perceived to be valuable within the department, school and hospitals. This too will be one of the important issues we will be discussing at the upcoming Leadership Retreat – and it is also one that we will be focusing on for many years to come.

Continuing to Improve and Diversify our Faculty and Community

Although we seem large in size and complexity to the rest of the University, the Stanford School of Medicine and Medical Center is small in comparison to peer institutions. With just under 800 UTL and MCL faculty (with a cap of 900) and approximately 250 clinician educator faculty, we are still less than half the size of UCSF and less than 10% the size of Harvard Medical School. Accordingly, we must make critical decisions about each faculty appointment and reappointment and be sure that each is providing the

highest degree of excellence possible. We also want to be a faculty that is as diverse as possible and that provides a panoply of skills and role models to our students and community.

By necessity we make strategic decisions about when to search for additional faculty and which areas we need to expand, renew or initiate. As we do so, we also want to be proactive in diversifying the leadership of the School and in developing the leadership skills and capacities of all of our faculty. To help with these efforts I created the new position of Senior Associate Dean for Diversity and Leadership and appointed Dr. Hannah Valentine to this role approximately two years ago. Since then we have developed clearer procedures for conducting faculty searches, particularly in the area of identifying as diverse a candidate pool as possible, and have launched a number of leadership development programs for various segments of our faculty. While we have made progress, we still have a long way to go. Without question enhancing diversity and leadership is not a point-in-time commitment but rather one that must endure as part of our institutional culture. It is certainly one of my highest priorities as well.

We are also continuing to grapple with ways of supporting our faculty and staff in light of the many demands they face in their professional lives and to doing what we can as an institution to address the issue of professional/family balance. This too is an ongoing struggle given the many pressures and demands faced by families for childcare and increasingly for eldercare. I do not want to be Pollyannaish or offer promissory notes that may be difficult or impossible to deliver. Indeed, improving diversity, promoting leadership and exercising better professional/family balance are difficult challenges, but they are ones I want to work on with you, for the sake of our collective future. That will likely require a number of cultural and procedural changes in our community, including the School of Medicine, the University and the hospitals. Further, improvements will take time – but we are committed to working on them.

Meeting Financial Challenges and Building Our Future

When the decision was made to move the School of Medicine from San Francisco to the Stanford campus nearly 50 years ago, a number of major challenges needed to be addressed that had significant impact on the then fledgling new medical school. New facilities were needed, new faculty members needed to be recruited – especially in the basic sciences- and lost members of the clinical faculty who remained in San Francisco needed to be replaced. The successful solutions to these very significant challenges helped establish the foundation that has defined the School of Medicine for the decades that followed. Now, nearly a half-century later, we face a similar set of challenges. Our education, research and clinical facilities are aging or are insufficient to meet our current and projected needs. While we have recruited wonderful faculty and students, we face serious limitations in funding, both in research and in clinical care. These challenges are not unique to Stanford, but the resources needed to address them are considerable.

Finding the balance between the need to build new facilities and the need to support the recruitment, retention and program development of faculty and initiatives will surely be an ongoing challenge. We are fortunate in having a significant endowment, even though

nearly 86% of it is restricted. In order to plan for our future as wisely as possible, we have developed a 10-year financial plan that is based on a number of relatively conservative assumptions. In tandem, we have developed a bold estimate of our philanthropic needs that is part of the Stanford Challenge, which commenced in October 2006 (see: http://deansnewsletter.stanford.edu/archive/10_23_06.html#1). Among our greatest challenges is the need for new facilities and, accordingly, we have also developed a comprehensive 10-20 year plan that I outlined in my December 4, 2006 Newsletter (see: http://deansnewsletter.stanford.edu/archive/12_04_06.html). While there is no question that these needs are daunting, we are already making important progress, and I am optimistic that we will ultimately be successful. But I have no illusions: I doubt we will follow the shortest distance between two points as our route to success. However, given my avocation as a marathoner, I am also confident that we can make it across the finish line as long as we maintain a reasoned pace and not lose sight of our goals – however distant they may seem to be at times. That is one of the reasons why thoughtful planning (a surrogate for training) is so necessary – but so too is constant adaptation to the conditions and challenges we will surely face at different stages of this journey. Just as our predecessors helped shape and define Stanford Medical School 50 years ago, we now have the obligation to serve as the stewards of its next 50 years. With a lot of hard work – and considerable patience – we will succeed.

Reaching Out to Our Communities

I have previously discussed some of the challenges we face in overcoming the tide of public opinion regarding science and religion (see: http://deansnewsletter.stanford.edu/archive/11_14_05.html#1) or in the federal support for biomedical research (see: http://deansnewsletter.stanford.edu/archive/12_18_06.html#1d) or the vicissitudes of our currently deficient health care system (see: http://deansnewsletter.stanford.edu/archive/09_11_06.html#5 and http://deansnewsletter.stanford.edu/archive/02_06_06.html). These and many other issues require our ongoing interaction with various public and private constituencies. Thankfully, during the past several years Stanford has played an important role in a number of highly relevant public issues and debates. We are fortunate in having an excellent Office of Communications and Public Affairs whose dedicated staff has helped us enormously in getting our messages out to various communities. Most importantly, we have benefited from the thoughtful voices of numerous faculty and student leaders who have provided education, information and advocacy.

We will, of course, have to make our communication efforts even more robust. Whether in local issues regarding the important need for hospital renewal and facilities expansion to support the health care needs of the citizens of Palo Alto and our surrounding communities, or the stem cell debate in California or at the federal level, or the importance of biomedical funding from the NIH, states and private foundations, or the ethical issues governing research and professional behavior, or the need for a dramatically improved health care system, we have expertise and experience that we can – and must – add to the local and national dialogue.

In addition to the mandate for education and advocacy, we must also reach out to our communities for philanthropic support. This is more important than ever – and our success will be closely tied to how compelling and exciting our mission and opportunities are to those who will lend their support. Here too I believe we have done a terrific job of defining what we can accomplish in education, research and patient care and the unique role Stanford can play. There is no question that we will be competing against many other worthy causes, but I think we have an enormous amount to offer – as long as we stay aligned and clear in the messages we convey and in the motivations that guide them.

Stanford Medicine as A Role Model

When all is said and done, we need to remember why what we are doing is so important. As a small research-intensive School of Medicine, Stanford has the opportunity –and I believe obligation –to serve as a role model. We have worked diligently to define and fulfill our mission *to be a premier research-intensive medical school that improves health through leadership and a collaborative approach to discovery and innovation in patient care, education and research.*

While the tide of cynicism about health care, the ethical behavior of doctors, and the quality of and safety of the care they deliver, as well as the wave of anti-science sentiment that has swept policy-makers and citizens, have had a chilling impact, they do serve to underscore the work we need to do to gain the public trust in support of medicine, science and Stanford. While we are not alone in this struggle, I think we can – and must – be a leader and role model for others. In the last several years we have made some important inroads and have had significant accomplishments, but much remains to be done. So, as we begin a new year and look forward to the future, one abiding objective is to do all we can to make Stanford a role model for academic medicine – because it is the right thing to do and because we can accomplish this if we work creatively, thoughtfully and together.

Changes in Leadership

New Chair of Bioengineering: As most of you know, Scott Delp and Paul Yock asked to step down as Chair and co-chair of Bioengineering at the end of 2006. They have held these positions since the department was founded several years ago. By any measure the department is on a remarkable path to success. A set of absolutely amazing new faculty have been hired. The best Bioengineering graduate students in the country now choose Stanford as their destination. A new graduate curriculum has been developed. The idea of a department positioned between two schools has become an exciting role model for interdisciplinary activities at Stanford. And the department has become a centerpiece of the recently launched university campaign.

While many people have contributed to launching and growing this new department, Scott and Paul have been the two individuals most responsible for its success. All of us owe them a tremendous amount for the energy and enthusiasm they have provided. Both of them expect to remain fully active in the department going forward.

Professor Jim Plummer, Dean of the School of Engineering and I are delighted to announce that Dr. Russ Altman has agreed to be the next Chair of Bioengineering. Russ will hold a joint appointment between Bioengineering and Genetics, with Bioengineering as his primary department (just as Scott holds a joint appointment between Bioengineering and ME). Russ brings a very high level of enthusiasm for the department and a vision for its future that will lead it to the next level of stature and accomplishment. Looking forward, there are tremendous opportunities for Bioengineering, including establishing an undergraduate major, designing and occupying a new building in the SEQ II, and continuing to recruit spectacular new faculty to Stanford.

Please join Jim Plummer and me in thanking Scott and Paul for the spectacular job they have done leading the department since BioE's founding, and in welcoming Russ to his new role as Chair of Bioengineering.

New Chair of Developmental Biology: We are enormously fortunate to have a terrific department of Developmental Biology at Stanford that was initially founded and led by Dr. Lucy Shapiro. For the past four years Dr. Minx Fuller has done an excellent job in serving as chair of Developmental Biology and has overseen the recruitment of outstanding new faculty and students. The department continues to thrive. Minx also served as a wonderful institutional leader and I am appreciative of her many important recommendations and accomplishments. But after four years of service, Dr. Fuller decided that it was time for her to focus her energies on her own research and teaching. Thankfully, Dr. Roel Nusse, who previously served as chair, has agreed to once again assume that mantle of leadership. I am enormously grateful to Roel and I know that the faculty in Developmental Biology are also appreciative of his renewed leadership. Again, I want to thank Minx Fuller for all of her efforts and contributions and welcome Roel to his new leadership role.

New Senior Associate Dean for Graduate Medical Education: On October 9 2006 I announced two of the three individuals who will figure prominently in defining medical and graduate student education at Stanford (see: http://deansnewsletter.stanford.edu/archive/11_09_06.html#3) and also forecast the importance of creating a new position to better align residency, fellow and continuing medical education with the school's academic programs. I am very pleased to announce that Dr. Myriam Curet, Professor of Surgery, has agreed to assume these new roles starting in April 2007. Dr. Curet is a highly regarded educator who has won numerous awards as a teacher both nationally and at Stanford. She is strongly and passionately committed to education and has already served the School admirably as Associate Dean for the past two years. I am extremely pleased that she has agreed to take on this important and exciting new role and look forward to working with her in the years ahead – and most importantly, to the success that she will achieve for our medical center.

Awards and Honors

Helen M. Blau, Ph.D., Donald E. and Delia B. Baxter Professor and Director of the Baxter Laboratory in Genetic Pharmacology, has been re-elected to the governing council of the prestigious Institute of Medicine of the National Academies. Dr. Blau has served on the IOM Council since 2004 and has been elected for a second three-year term as a member of the Council's executive committee, which provides oversight for all of the institute's activities.

Dr. Alice S. Whittemore, Professor of Health Research and Policy, has been awarded this year's NCI Women in Cancer Search award, and in that capacity has just given the Rosalind Franklin lecture on "Preventing deaths from Breast and Ovarian Cancer." Congratulations, Dr. Whittemore.

Norbert Pelc, D.Sc., Professor of Radiology and Bioengineering, and by courtesy Electrical Engineering, has been elected to the College of Fellows of the American Institute for Medical and Biological Engineering (AIMBE). Membership is awarded to "leaders in the field [who] have distinguished themselves through their contributions in research, industrial practice and/or education." The award will be conferred at the Institute's annual meeting in March 2007. Congratulations, Dr. Pelc.

Appointments and Promotions

Marc Coram has been reappointed to Assistant Professor of Health Research and Policy, effective 1/1/2007.

Bingwei Lu has been reappointed to Assistant Professor of Pathology, effective 1/1/2007.

Dean's Newsletter January 29, 2007

Discovery, Innovation and the NIH

There is little question that the flattening of the NIH budget has caused considerable anxiety throughout academia – and for good reason. And while NIH leaders attribute much of the current funding challenges now being faced by investigators and faculty to the increased number of applications being submitted, the reality is that three years of budgets below inflation have taken a serious toll on NIH funding and have eroded many of the gains achieved during the doubling that took place between 1998-2003 – especially in basic discovery research.

I have previously written on the challenges we now face in biomedical funding (see: http://deansnewsletter.stanford.edu/archive/12_18_06.html#1d) and on the need to do all we can to educate and engage the public and federal government leaders to bring the NIH budget to a better level – and at least in line with inflation. The challenges we now face are multifaceted. They include the severe limitations on the federal discretionary budget that have contributed to some of the cutbacks as well as the perception by many Congressional Members that NIH had its turn for increased financial support and that other agencies should now receive a higher priority. This position has been fueled by the view that cures and breakthroughs did not follow the increases in NIH funding several years ago – an unfortunate and unintended consequence of setting expectations too high during the build up to the NIH doubling. Further, the loss of confidence of the NIH due to recent conflict of interest scandals as well as the general rise in anti-science sentiments, which have been more visibly expressed during the past several years, have also negatively impacted the wide bipartisan support previously enjoyed by the NIH.

Some of these issues posed a serious challenge to the integrity of the 2006 NIH reauthorization process. A number of us at Stanford and nationally became quite engaged with this process, which, thankfully, had a better outcome than was anticipated last summer (see http://deansnewsletter.stanford.edu/archive/12_18_06.html#1d). As you know, I have been working with other leaders of academic medical centers, not only on this issue but on related topics from a public policy and advocacy point of view – and I am well aware, and appreciative, that many of our faculty have also been doing all they can to address these important challenges.

While our support for discovery and innovation is unwavering – as is our recognition that they serve as the both the foundation and the “glow factor” of modern science and, of course, of Stanford – it is also important to seek additional funding for the NIH, which remains the engine of discovery in this country, in terms that Congress can resonate to. One quite appropriate argument is that discovery and innovation not only create new knowledge and the potential for improving the diagnosis, treatment and prevention of disease, but that they also fuel economic development. Such an argument has proved successful in the pursuit of much needed and justified support for the physical and engineering sciences. I have also championed this argument with our colleagues in biotechnology in California, who also fully understand and support this perspective. In fact, I had an opportunity to further promote this viewpoint last week in Washington in meetings with numerous House Members representing various districts in California. Specifically, I joined a small group of CEOs and leaders from the California Healthcare Institute for a daylong set of congressional visits on Thursday January 18th. Our message on the importance of basic research discovery and innovation to the health of our nation was clear and, thankfully, very well received by every congressional member with whom we visited. While there is no question that funding challenges remain, I was encouraged by the clear change in interest that has seemed to follow the November elections.

We certainly have much work to do, but there does seem to be a more receptive audience to our message about discovery and innovation in the biosciences. I would thus encourage you to continue working through your professional societies and contacts to

foster support for the NIH and biomedical research. For the first time in a while I am hopeful that positive changes may be on the horizon, which, even if they are slow to come and less than we need, may be a new beginning of support for discovery, innovation and biomedical research.

School of Medicine Financial Update

At the Executive Committee meeting on January 19th, Marcia Cohen, Senior Associate Dean, Finance and Administration, provided an update on the financial state of the School. The focus of her presentation was on the financial results for FY 2006, which ended August 31, 2006, and the budget projected for FY 2007. The School ended FY 2006 with a surplus of \$50 million on a base of total revenues of \$939 million. This compares favorably to the surplus of \$20 million in FY 2005 and a budgeted deficit of \$24 million. However, it is important to note that this is a consolidated surplus that includes departments as well as the Dean's Office and that contains some elements that mask the true bottom line.

Among the key contributors to the positive bottom line was the \$57 million increase in clinical revenues from the prior year, due in part to the change in the funds flow between the School and Stanford Hospital and Clinics, and in part to growth in the size of clinical activities. Without question these are positive changes that reflect an improvement in professional service payments as well as the hard work of our clinical faculty. The overall positive bottom line was also a result of delays in transferring funds for major capital projects, including the renovation of leased space at 1050 Arastradero for the Institute of Stem Cell Biology and Regenerative Medicine and the Neuroscience Institute, and the initiation of construction of the Learning and Knowledge Center (LKC) and Connective Elements. However, these capital expenditures are anticipated for FY 2007. Thus, the bottom line for FY 2006 is somewhat artificially elevated, since ultimately these funds will be spent.

That said, the positive result in FY 2006 occurred in spite of slowed growth in sponsored research – the School's total direct and indirect revenues from sponsored projects totaled \$371 million in FY 2006 compared to \$372 million in FY 2005. We are of course quite concerned about this trend, which reflects, in part, decreased funding from the NIH (see above). Since sponsored research awards represent one of the most important sources of income for faculty and the school, erosion in this sector can have dire consequences. While we anticipate that federal support from the NIH will likely be flat to slightly negative, we are projecting that support for stem cell research through the California Institute for Regenerative Medicine will help alleviate some of the negative impact in federally sponsored research support. While I am pleased that there is likely to be state support for stem cell research, it is also of some concern to me that the current politics around stem cell research is shifting the research agenda in this area from the federal to the state level. The immediate benefits of moving the research agenda are clear – at least in California - but the potential that this will further weaken the prominence of the NIH in biomedical research is a source of concern.

The School budget for FY 2007 includes total revenues of \$946 million, total expenses of \$956 million, and an overall projected deficit of \$10 million. Modest growth of clinical activity (+2%) and growth in sponsored project revenues (4%) are projected in the FY 2007 budget. However, the ability to further increase clinical volume is negatively impacted by capacity constraints at both Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. Further it is anticipated that the funding climate for health care providers is likely to worsen over the next several years – in contrast to the recent past. As noted, the decline in federal support for sponsored research is a serious challenge that is partly alleviated by the probability of state funding for stem cell research.

At the same time, the Dean's Office is increasing its investments in strategic initiatives, including more than \$7 million on recruitment commitments, \$11 million on institutes and centers, \$3.7 million on interschool initiatives (Bio X/Clark, Bioengineering), \$5.3 million on central services (Office of Medical Development, Clinical Research/SPCTRM, and Diversity and Leadership), and \$1.8 million in education. These investments reflect our commitment to the Stanford Challenge and to enhancing our excellence in research and patient care.

Ms. Cohen also presented financial information on the Dean's Office operations, showing that while, overall, departments had a surplus in FY 2006 and also a projected surplus in FY 2007, the Dean's Office experienced a net deficit of \$9 million in FY 2006 and has a budgeted deficit of \$28 million in FY 2007. The results are indicative of the investments the Dean's Office is making and plans to make in recruitments, strategic initiatives and capital projects that exceed current year revenues. Obviously this is not sustainable over time. Future years will require discussions between the Dean's Office and departments about how to optimize funding and spending to meet individual and collective needs for the School and our missions in education, research and patient care.

Emerging International Interactions

One of the major goals of the Stanford Challenge (see: http://deansnewsletter.stanford.edu/archive/10_23_06.html) is to reach out to our global colleagues and use our knowledge and skills to improve the world we live in. As communications and information technology have recalibrated international initiatives, we frequently encounter individual colleagues as well as institutions and even nations seeking intersections and collaborations with Stanford. During the past two weeks I had several experiences that serve to underscore the importance of international initiatives and partnerships.

On January 15-16th the leaders of the Stanford Neuroscience Institute hosted a meeting with scientists from the University of Lund in Sweden. I had the opportunity to meet with the Dean of the School of Medicine and several faculty leaders from Lund. I was struck by the similarity of their goals to ours in fostering research that transcends traditional institutional boundaries and disciplines and that seeks new interactions among the physical and life sciences to better understand the workings of the brain and nervous system – and as a consequence to enhance and even transform the approach to important

neurological disorders. A continued exchange of ideas and, potentially, of students and faculty will help to promote future dialogue and collaboration – a goal consistent with the Stanford Challenge.

On January 19th I participated in a meeting led by leaders from the Freeman Spogli Institute for International Studies about the Medical School's potential involvement in education and research initiatives in China. Because several of our faculty are already engaged in interactions or collaborations in China it seemed prudent to first inventory faculty interest – a process now underway by a committee comprised of Drs. Scott Atlas (Radiology), Nancy Shulman (Medicine- Infectious Disease) and Sam So (Surgery). Given the evolving role of China on the global stage it is clearly important that such relationships be better defined and supported.

And then on January 24-25th I joined Drs. Harry Greenberg, Rajiv Doshi and Paul Yock in New Delhi, India. There we met with leaders from academia and the Department of Biotechnology in the Ministry of Science and Technology to explore the potential development of a Stanford-India Biodesign Program modeled on the highly successful program developed at Stanford under the vision and leadership of Dr. Yock and colleagues (see: <http://www.stanford.edu/group/biodesign/>). During an intense two-day series of meetings and discussions with academic and government leaders, including the Minister of Health, we had the opportunity to learn a considerable amount about shared goals and objectives with academic leaders from engineering and medicine throughout India and forged a path that could lead to very exciting and catalytic collaborations.

What struck me in each of these interactions was the similarity of our thinking on important issues and challenges in science and medicine. Not infrequently we convince ourselves of the uniqueness or at least the distinctiveness of our ideas or plans– at least in our eyes. It is both sobering and refreshing to recognize that good ideas have no geographic boundaries and that physicians and scientists around the world are also thinking about ways to better unite medicine, the biosciences, the physical sciences and engineering to better understand bioscience and medicine. It is true that the ability to implement novel approaches may vary – and that in this respect Stanford is likely among the most distinctive institutions in its ability to foster innovation and discovery in a spirit of entrepreneurship. But it is also true that a focused series of international interactions that build on our core missions of discovery and innovation will surely play an important role in Stanford's future – and in future generations of students, trainees and faculty, not only on our home campus but around the world.

Debate on the Physician Workforce

At the Board of Directors meeting of the Association of Academic Health Centers on Saturday, January 20th we had an interesting discussion about the assumptions behind the proposed increase in the physician workforce being championed by the Association of American Medical Colleges (AAMC). You may recall that the AAMC has called for a 15-30% increase in the physician workforce – which is already being met by increases in the size of medical school classes as well as an outcropping of new medical schools (see:

http://deansnewsletter.stanford.edu/archive/09_19_05.html#7 and http://deansnewsletter.stanford.edu/archive/02_21_06.html#7). While I certainly agree that there is a misdistribution of physicians in the USA, a shortage of primary care doctors in various regions of the country, especially rural areas, and a lack of selected specialty physicians, the fundamental assertion that a serious physician workforce problem exists is less well founded.

One of my major concerns with the recent projections and the call to increase the numbers of medical school graduates is that a larger number of physicians *per se* will not necessarily address the national distribution of doctors or the areas of medicine they choose to practice. Unless entry into specific fields is channeled and other areas regulated (neither of which is likely to occur) it seems unlikely that the overall practice patterns or career choices will be significantly altered. From my perspective, rather than focusing on graduating a larger number of new physicians, it would seem more prudent to address the overall health care workforce and, in particular, the roles for non-physician providers. While one of the major drivers for expanding the physician workforce is the projected increase in the elderly, a more careful examination of the scope of medical care being provided seems a more important initial step.

Of interest, the Health Resources and Services Administration (HRSA) issued a report in October 2006 on “Physicians Supply and Demand: Projections to 2020” that offers a contrasting analysis and perspective. Based on this recent report, the current physician workforce in the USA in the base year (2000) included an estimated 756,000 active physicians under age 75 with approximately 95% being MDs and 5% DOs. Based on projection models, the number of practicing physicians in 2005 who are less than 75 years of age was estimated to be 817,000, with slightly over one third in primary care and the remaining serving as specialists. As the number of women entering medical school has risen during recent decades, so too has the proportion of the workforce that is female. The work patterns of men vs. women (where women have, to date, chosen more primary care practices) serve as another important variable in workforce projections. By 2020, FTE physicians who are engaged primarily in patient care are projected to reach 866,000 (a 10 percent increase from current levels). The census bureau estimates that the USA population will grow by a relatively commensurate rate between 2005 and 2020, resulting in a relatively constant full-time equivalent patient care physician per 100,000 population ratio of approximately 259. In addition, there will be an increasing proportion of elderly citizens who may require medical services.

There is considerable variation in projections by specialty area, and some do experience limitations in physician supply. However, it is very hard to accurately project specific specialty or discipline needs – or the choices of medical school graduates in pursuing them. What does seem clear is that simply graduating more MDs won’t necessarily fill critical need areas – as has been well demonstrated during past decades. Further, workforce projections can also be influenced by changes in the health status of communities or populations, new technology advances, changes in payment or physician productivity, the entry of non-physician clinicians or variances in the models of health care delivery or of health care systems. Based on the analysis it conducted, the HRSA

report notes that “the growth and aging of the United States population will cause a surge in demand for physician services. If current healthcare utilization and delivery patterns continue, the overall supply of physicians should be sufficient to meet the expected demand through the next 10 years. This finding suggests the need for modest increases in United States medical school capacity.” It is certainly at variance with the recommendations by the AAMC to increase the current medical school class size by 30% and to expand the number of medical schools. This is an issue that requires considerable more thought and some tempering of the current focus on expanding MD graduates.

While the issues about the physician workforce are important to all of us, they have a different complexion at Stanford. We are a small research-intensive school of medicine, and while we certainly want to educate and train outstanding physicians, our primary focus should be on educating leaders and physician scholars as well as leaders in the biosciences. If we were to increase our class size, something that requires further contemplation, it would be to address the shortage of physician-scientists - which is a serious problem in the USA and something we are in a unique position to help address. But this too requires additional debate and discussion.

Fellowship Opportunity at the Stanford Center on Longevity

The Stanford Center on Longevity (SCL) will fund postdoctoral fellows for three years of full-time research in interdisciplinary studies related to aging or longevity. We expect to fund two fellows per year and therefore, after three years, to have six fellows in the program on an ongoing basis. The deadline to apply is April 1, 2007. Funding to begin July 1, 2007.

For eligibility requirements and additional information and application form click here: <http://longevity2.stanford.edu/docs/literal/mission.html> then click on the "Fellowships" link.

Some Notable Comings and Goings

We learned several days ago that **Dr. Renee A. Reijo Pera**, currently Co-Director of the Human Embryonic Stem Cell Research Center and Director of the CIRM Training Program at UCSF, has accepted our offer to join Stanford as the Director of Human Embryonic Stem Cell Research and Education in the Stanford Institute for Stem Cell Biology and Regenerative Medicine, and Director of Human Stem Cell Research in the Department of Obstetrics and Gynecology, where she will have her academic appointment. Dr Pera is an internationally recognized leader in embryonic stem cell research and is highly recognized for her scientific accomplishments as well as for her achievements as an educator and mentor. Dr. Pera received her PhD from Cornell and was a Damon Runyon Fellow at the Whitehead Institute and Instructor at MIT before joining UCSF in 1997. She has received numerous awards for her work including the American Stem Cell Research Foundation Award and the Outstanding Faculty Mentor at UCSF Award. In September 2006 Dr. Pera was cited by Newsweek magazine as one of the twenty most influential leaders in the USA. Critical to Dr. Pera's successful recruitment was the combined efforts of Drs. Irv Weissman, Jonathan Berek and Mike Longaker. I want to thank them and also thank our Provost, John Etchemendy, for his

special assistance as well. We are very pleased to have Dr. Pera as a new member of our Stanford community and I hope you will join me in welcoming her.

Dr. Alan Krensky, the Shelagh Galligan Professor of Pediatrics and Chief, Division of Immunology and Transplantation Biology, will officially join the National Institutes of Health in July 2007 as the Deputy Director for the Office of Portfolio Analysis and Strategic Initiatives (OPASI). Dr. Krensky has been a faculty member at Stanford since 1982 and has made numerous and significant contributions as a physician-scientist as well as one of the key architects of the Children's Health Initiative. Indeed he was instrumental in guiding both key initiatives and important recruitments that have helped transform Stanford Pediatrics and the Lucile Packard Children's Hospital. He will be the first incumbent of the newly established OPASI and, as noted by Elias Zerhouni, Director of the NIH, "he will play a key leadership role as the Office of Portfolio Analysis and Strategic Initiatives provides an 'incubator space' to accelerate critical research efforts that address major, cross-cutting NIH priorities."

As described by the NIH, the Office of Portfolio Analysis and Strategic Initiatives was built on the success of the NIH Roadmap for Medical Research and has two goals: to identify important areas of emerging scientific opportunities or rising public health challenges, and to help accelerate investments in these areas to make sure new ideas have a chance to develop. Accordingly, OPASI provides new opportunity for more trans-NIH dialogue, decision-making, and funding and provides the National Institutes of Health with the methods and information necessary to manage its large and complex scientific portfolios and also to help identify important areas of emerging scientific opportunities or rising public health challenges and assists in their rapid implementation.

I want to take this opportunity to thank Dr. Krensky for his many significant contributions, which have been extremely important and which will be enduring. Please also join me in congratulating Dr. Krensky for his important national leadership position. We wish him the very best of success.

Awards and Honors

Helen Blau, PhD, the Donald E. and Delia B. Baxter Professor and Director of the Baxter Laboratory in Genetic Pharmacology, has been appointed to the Scientific Advisory Board of the Ellison Medical Foundation, as of Jan. 1, 2007 for two years. The Ellison Medical Foundation supports basic biomedical research on aging relevant to understanding lifespan development processes and age-related diseases and disabilities, with the goal of stimulating new, creative research that might not be funded by traditional sources or that is often under-funded in the U.S. Congratulations, Dr. Blau.

W. James Nelson, PhD, the Rudy J. and Daphne Donohue Munzer Professor in the School of Medicine, has been appointed by HHS Secretary Michael O. Leavitt as one of three new members to National Advisory General Medical Sciences Council. The council is composed of leaders in the biological and medical sciences, education, health care and

public affairs and members are appointed to four-year terms. Congratulations, Dr. Nelson.

Appointments and Promotions

Raffick Bowen has been appointed to Assistant Professor of Pathology, effective 1/1/2007.

Lorinda Chung has been appointed to Assistant Professor of Medicine (Immunology and Rheumatology) at the Veterans Affairs Palo Alto Health Care System, effective 1/1/2007.

Marc Coram has been appointed to Assistant Professor of Health Research and Policy, effective 1/01/2007.

Myriam J. Curet has been promoted to Professor of Surgery, effective 1/1/2007.

Gundeep S. Dhillon has been appointed to Assistant Professor of Medicine (Pulmonary and Critical Care Medicine), effective 1/1/2007.

Dean Felsher has been promoted to Associate Professor of Medicine (Oncology) and of Pathology, effective 2/1/2007.

Shai Friedland has been reappointed to Assistant Professor of Medicine (Gastroenterology and Hepatology) at the Veterans Affairs Palo Alto Health Care System, effective 1/1/2007.

Kathleen Gutierrez has been reappointed to Assistant Professor of Pediatrics (Infectious Diseases) at the Lucile Salter Packard Children's Hospital, effective 4/1/2007.

Judy Illes has been appointed to Associate Professor (Research) of Pediatrics, effective 2/1/2007.

Michael R. Jeng has been promoted to Associate Professor of Pediatrics (Hematology and Oncology) at the Lucile Salter Packard Children's Hospital, effective 1/1/2007.

Bingwei Lu has been reappointed to Assistant Professor of Pathology, effective 1/1/2007.

Greer M. Murphy has been promoted to Professor of Psychiatry and Behavioral Sciences, effective 1/1/2007.

Mei-Chiung Shih has been appointed to Assistant Professor of Health Research and Policy, effective 1/1/2007.

Christopher N. Ta has been promoted to Associate Professor of Ophthalmology, effective 1/1/2007.

Victor Tse has been promoted to Associate Professor of Neurosurgery at the Santa Clara Valley Medical Center, effective 1/1/2007.

Wen-Kai Weng has been appointed to Assistant Professor of Medicine (Bone Marrow Transplantation, effective 1/1/2007.

Dean's Newsletter

February 12, 2007

Translating Discoveries – Leading the Way

On February 1-3rd we held our School of Medicine Annual Leadership Retreat – the sixth since my arrival at Stanford in April 2001. We have used these retreats to shape our strategic planning, report progress on school-wide initiatives and address important questions and challenges facing the school and medical center. While the composition of the participants changes slightly from year-to-year based on the topics being considered, the core group of 80-90 individuals includes chairs of basic and clinical departments, institute and selected center directors and other School leaders, hospital leaders, medical and graduate students as well as resident and fellow/postdoc organization leaders, university officials, and trustees or hospital board directors. This year we also invited several faculty leaders from other schools at Stanford. The group is diverse but also focused on helping us to make the Stanford University School of Medicine the best it can be. By design the schedule is fairly demanding – but since time is precious it is important to use our retreat time wisely to truly advance our programmatic initiatives. The theme of this year's retreat was ***“Translating Discoveries – Leading the Way,”*** and it built on the Strategic Plan that grew out of our first retreat in January 2002 (see: <http://medstrategicplan.stanford.edu/>).

Challenges Facing Academic Medical Centers: A View from the East

This year we began the retreat with a presentation from Dr. Mark McClellan, a Stanford faculty member who has been on leave in Washington, where he served sequentially as the Commissioner of the Food and Drug Administration (FDA) and, until late in 2006, as the Director of the Center for Medicare and Medicaid Services (CMS). These two enormously important leadership roles equipped Dr. McClellan with a valuable perspective on issues facing critically important federal agencies and programs – as well as healthcare and biomedical research. Further, in each of his leadership positions, Dr. McClellan helped bring about significant changes and new programmatic initiatives.

Dr. McClellan began his remarks by addressing the funding climate impacting the NIH. He affirmed a message I have also conveyed in prior Newsletters (see <http://mednews.stanford.edu/releases/2006/december/year-review.html#nih>); namely, that following the doubling of the NIH budget between 1990-2003, the subsequent years' budgets have been flat to decreased – especially when compared to the biomedical inflation index. The impact of this trend has raised significant and growing concern among the biomedical and bioscience community. Part of the challenge is related to the fact that nearly twice the number of grant applications are being submitted now compared

to the pre-doubling era. . However, it is also increasingly apparent that grants scoring ratings that would clearly have been funded just a couple of years ago are now experiencing difficulty and that even highly established investigators are encountering problems in getting funded. This situation has been also further impacted by some of the political issues that recently surrounded the NIH Reauthorization (see <http://deansnewsletter.stanford.edu/#1>) as well as the perspective in the Congress that NIH had its doubling and now other federal programs need attention – an issue made more acute by the overall decrease in discretionary funding due to the war in Iraq, tax cuts and other federal initiatives. At the same time, the NIH has directed increased attention to promoting research and education in translational research and medicine. Dr. McClellan emphasized the importance for Stanford to seize these opportunities, especially given our focus and excellence in innovation and our proximity to the biotechnology community in Silicon Valley and the Bay area.

While Dr. McClellan did not forecast budget increases for NIH that bore any resemblance to the period of doubling, he did observe that increased support for the FDA is essential and that reform of this agency is likely to occur this year. He opined that Stanford should also align some of its clinical and translational research programs to benefit from changes at the FDA, especially in novel areas of clinical trial methodology, design and analysis that employs better use of biomarkers, genomics, imaging, and improved methods of statistical analysis. Given our focus in recent years in building the infrastructure and interdisciplinary organization to foster clinical and translational research, recently exemplified by the submission of our application for a Clinical and Translational Science Award (CTSA), I would certainly say that we have been oriented toward improving and advancing our efforts in this area of research – which is also important to our distinction and uniqueness as a medical center.

Beyond research and regulation, Dr. McClellan observed that there would be an increased focus on health care reform in the years ahead, which would address in particular coverage of the uninsured and cost containment. He noted that, while some of this reform may be initiated at the federal level, the major activities were likely to emerge from the states – as has recently occurred in proposals by governors in Massachusetts, California, New York and others. The major federal initiatives will likely concentrate on entitlement programs, particularly Medicare and Medicaid. Dr. McClellan offered his view that the Part D drug coverage initiated last year has been a success (although how much the pharmaceutical companies have benefited from this approach was not discussed). He noted in particular that a major area of reform will be in aligning Medicare payments to high value care and that this will mandate the need for metrics to measure quality and service – including clinical quality, patient satisfaction, prices and cost, among others. Indeed, “pay for performance” for hospital and physician services is already becoming a reality under Medicare (see: NEJM 2007; 356:515), and there is every expectation that it will be quickly embraced by private payers. Quality and service data will be made publicly available by rating agencies – or by institutions – and there is every reason to expect that such data will influence consumer choice about where to seek their health care.

While challenges abound, Dr. McClellan observed that, given the changes underway, there are some important opportunities for Stanford. First, he underscored that Stanford should be a leader in translational medicine. While we have certainly played a leadership role in devices and other innovations, this role should extend to biologics and drugs and should be based on novel trial design, the integration of genomics, imaging, and biomarkers, and novel alignments with biotechnology. He also observed that we should use quality performance as a measure of distinction – and even as a competitive tool. Further work is to be done in novel approaches to education and training, especially outside of the traditional hospital environment. And finally, while attention to local and regional issues is important, Dr. McClellan also underscored that in the 21st century global engagements will also impact health care and will require our attention. Each of these important challenges will affect our future. Fortunately, each has been encompassed in one fashion or another in our strategic planning – and were topics for this year's Leadership Retreat.

State-of-the-School in 2007

Building on the challenges and opportunities that I believe affect each of our missions and that I commented on in my January 15th Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/01_15_07.html) I followed Dr. McClellan's presentation with a perspective that raised some of the important issues that would be discussed at the retreat. I began by underscoring that 2006 had been a truly remarkable year for the medical school and that the past 5-6 years have been ones of forward momentum, excitement and success on many different fronts. However, while it is important to recognize and celebrate our many individual and collective accomplishments, our future rests more on how we address new challenges and anticipate the significant changes that will emerge, both within and outside of our institution and community, both local and global. Hence I underscored that the purpose of this retreat was to focus on the challenges– and that while this might convey some negative overtones, it is important that, as stewards of the future of Stanford, we consider these issues and develop plans to address them, not simply to survive but to excel and serve as a role model among academic medical centers.

I highlighted ten issues that, in my opinion, serve as serious challenges and even threats to our future success. I chose these areas because of their importance, because they would be topics for discussion at the retreat and because we have the opportunity to anticipate and even solve them, even though there would be many difficulties and risks. Each of these ten issues maps to various aspects of our core missions, essential values, programmatic initiatives and areas of controversy and contention. Being frank and honest with each other is an essential step to addressing such challenges – and I wanted to be sure that they were laid out in a transparent and palpable manner. This is particularly noteworthy as we stand at the threshold of the School of Medicine's Centennial in 2008 and the 50th Anniversary of the School's move from San Francisco to Palo Alto in 2009.

The ten areas were: 1) Discovery and Translation, 2) Size and Connectivity, 3) Depth and Breadth, 4) Disciplinary and Interdisciplinary, 5) Excellence, Professionalism and Quality, 6) Diversity, Leadership and Balance, 7) Resources and Renewal, 8) Program

and Capital Investments, 9) Internal and External Challenges, and 10) Moving Forward and Creating Our Future. Here I will simply highlight some of the observations, comments and recommendations I offered to the retreat participants:

1. Discovery and Translation:

There can be no question that the fundamental underpinning of medicine as a discipline and Stanford as an institution is a commitment to and recognition of the importance of discovery and basic science research. Excellence in curiosity- driven fundamental inquiry has been the defining signature of the medical school and is something to be proud of and to celebrate. Indeed it is notable that the faculty and leadership at Stanford have continuously renewed this commitment by recruiting outstanding faculty and by educating and training future leaders in the biosciences. So it is ironic that, at a time of extraordinary achievement, most recently evidenced by two Nobel Prizes in 2006, more NIH Pioneer Awards than any other medical school and a host of other faculty and students awards and recognitions, there is an air of anxiety and even some tension about whether our institutional commitment to discovery science remains unwavering.

Certainly a major contributing factor is the threat of decreased funding from the NIH ,which is affecting the entire bioscience community. However, this is not the sole issue. Over the past several years we have emphasized “Translating Discoveries” as our banner and overarching mission, and this emphasis has been highlighted by the increased importance that the NIH has placed on translational and clinical medicine. While I believe that I have been consistent and clear in underscoring the reality that translational medicine today is built upon a foundation in discovery science and that fundamental research is the core and centerpiece of our mission at Stanford, I have been surprised that our own great basic science faculty at times feel less valued both within the school and in the university more broadly. While this is certainly not the case, one can recognize that perceptions are important, and our focus on translating discoveries as well as the University’s highlighting of the human health initiative as part of the Stanford Challenge may seem to some to undervalue discovery science. This requires attention.

I well recall that at the first Leadership Retreat I hosted, in January 2002, there was a cultural rift between the basic sciences and the clinical sciences. This situation was partly historical and had clearly been aggravated by the crisis emanating from the failed merger and then de-merger with UCSF. Indeed, one of the most important things to emerge from the 2002 Retreat and those that have followed has been the building of bridges and relationships between the basic and clinical science communities – and, in tandem, between the medical school and the rest of the university. As I noted at the retreat, sustaining these important relationships is essential to our success as an academic medical center and begins with mutual sharing and valuing of what each of us brings to the work of enriching the school of medicine. We are a community that must value both discovery science and translational medicine and that benefits from improved understanding, collaboration and shared values.

But this does not necessarily happen naturally. It requires effort and indeed vigilance along with the recognition that we are a community of excellence built upon our shared

missions in education, research and patient care. One does not supercede the other in overall institutional importance – and each requires commitment in order to attain balance. I am personally committed to achieving that balance and to making the whole greater than the sum of our parts. But I am also cognizant that without our mutual efforts fracture lines can emerge – which we simply cannot let happen.

2. Size and Connectivity:

I have previously noted that Stanford is one of the smallest Schools of Medicine among our peers – about 40% the size of UCSF and less than 10% the faculty of Harvard Medical School. I see our small size largely as an advantage, since it forces us to make strategic choices and to appoint the highest quality faculty we can find. While I say this carefully, I believe that we have been able to accomplish this more or less across the board in our basic science appointments, where careful searches seeking the best in a field guide the selection of faculty. And while we clearly strive to identify the strongest faculty in the clinical departments as well, these selections are also driven by programmatic needs and not infrequently by fewer prospects in a national pool of potential candidates. A reality is that the national pipeline of outstanding physician-scientists is limited and a number of medical and surgical disciplines have a relative paucity of clinician-scholars, clinician-investigators and clinician-educators. Additionally, in the development of clinical programs it is almost always necessary to have a critical mass in order to provide sufficient depth of excellence and clinical coverage. Moreover, given the complexity of medicine today, it is not feasible to eliminate selected disciplines to preserve size constraints and to maintain a high quality program, especially when the emphasis is on high-end tertiary level clinical care as is the case at Stanford. So, an obvious challenge stands before us in sustaining excellence and meeting programmatic needs in the context of our current Provostial cap of 900 UTL, MCL and non-tenure line faculty. This issue has significant immediacy since we are soon to cross the number of 800 full-time faculty. Based on our projections of faculty growth and programmatic development it seems likely that we will reach the cap within the next three years and perhaps sooner.

A relevant question is the basis for the current cap. The medical center clearly benefits from being part of a great university, and all of Stanford's seven schools are small when compared to peers. But they are also excellent despite their size, and it is part of our culture to value excellence and a relatively small size. It is important to recognize the importance of balance within the University, and it is true that, should the medical school exceed the 900-faculty cap, it will become more than half the size of the total faculty of the University. While this kind of ratio is the case at many medical schools and universities, it is not part of our Stanford culture – and I readily acknowledge that we must be mindful and respectful of this reality.

But it is also clear that the detailed program planning we have done during the past 2-3 years has identified important and challenging issues related to our size. These include: (a) the size of our education programs (e.g., possibly leading to an increase in the medical school class size); (b) the need to balance the proportion of UTL, MCL and CE faculty to sustain excellence in basic science as well as clinical performance; (c) the importance of

fulfilling programmatic needs to sustain the clinical programs at SHC and LPCH (which over the next 10-20 years will almost certainly require exceeding the cap by 15%); and (d) the need to maintain a faculty size that will assure the close connectivity of the medical school with the rest of the university, so that we will not have to move research faculty “off campus” and, in doing so, lose the uniqueness that has defined our ability to carry out cutting-edge interdisciplinary research. Clearly size is both a source of strength – and a serious threat to our future excellence.

3. Depth and Breadth:

Our small size may limit our depth and breadth compared to peer institutions. But, as noted above, it compels us to focus on quality and to make strategic priorities. At the same time, it imposes a challenge to individual faculty, who, because of our small size, have multiple demands and expectations. While this is true for virtually everyone, there are additional pressures for clinical faculty, who are expected to demonstrate excellence and leadership in academic pursuits as well as in clinical care. In days past, many academic medical centers celebrated the “triple threat” physician-scientists, who were purportedly great investigators, teachers and clinicians. While I do not doubt that a few individuals can excel in all of these missions, the reality today is that, in order to be a great investigator or an outstanding physician, a sizeable portion of one’s time and effort must be concentrated and focused. We need to strive to set realistic expectations and align as optimally as possible the job expectations with realities for our faculty.

At Stanford there can be no doubt that the coin of the realm is excellence in research. And while this is very much what distinguishes us as an institution, we seem to spend less time than we might valuing the important contributions that faculty make in education and patient care. This has significant implications for how our appointment and promotion process is carried out – especially for clinical faculty. One of the reasons for this challenge is the lack of support and time available for clinical faculty to develop academic proficiency. When programs are limited by size and when patient volumes and demands continue to rise, as they have in recent years at both SHC and LPCH, clinical faculty have less time for scholarship – and are not supported to do so in our current fiscal environment. This becomes a self-fulfilled prophecy, in which busy clinical faculty become less engaged in the academic missions of research and education but feel the pressure to perform and the frustrations that emerge when they cannot do so as successfully as they might like – or our institution demands. Accordingly, if we are serious about having an excellent clinical faculty to complement our basic science faculty, it is important to provide time and support for individual scholarship. But the economic demands of clinical practice and the costs associated with “non-clinical time” pose serious challenges and limitations – which must be addressed.

This represents a threat on multiple levels: a failure to support a critical mass of individuals to sustain and enhance clinical excellence, an unstated understanding that excellence in research can compensate for a lesser performance in clinical acumen and skill, and an inability of motivated clinical faculty to not only be valued for the patient care they deliver but to do so with the greatest degree of excellence while also having protected time for research and education. If not addressed successfully a false hierarchy

of perceived value may emerge that could defeat the opportunity to create a community of excellence across the domains of science and medicine. As with the potential dipole of discovery and translation or that of limiting size and scope, a lack of attention to supporting depth and breadth is something on which we must focus creatively – including developing new funding sources to support the academic development and careers of clinical faculty.

4. Disciplinary and Interdisciplinary:

Academic medical centers, including Stanford, are built on a foundation of disciplines in the form of departments – both basic and clinical. Many of these disciplines were formulated during the 20th century, and a number have evolved dramatically – or will do so in the future. Whereas most medical schools when I was a student had basic science departments of anatomy, physiology, pharmacology and the like, most have evolved to more interdisciplinary areas of focus – and at Stanford, these more traditional departments or disciplines have been supplanted by new departments and programs. At the same time, most clinical departments have retained their traditional components, even though newer technologies and innovations might benefit from realignments of these traditional units. I have raised this issue in the past but recognize that major shifts such as these have significant consequences. So the alternate question is how to balance the disciplinary foundations with crosscutting interdisciplinary themes – whether they are disease focused (as some of our Stanford Institutes of Medicine) or whether they cut across traditional disciplinary boundaries (such as stem cell biology, genomics, imaging, and informatics). While there is concurrence about the need for both traditional departments and interdisciplinary efforts (e.g., institutes, centers or programs like bioengineering and BioX), there are also tensions that exist between them. Sometimes these have to do with perceptions about what is most important or valued, whereas in other situations the potential allocation of resources (space, billets, dollars) creates the challenge.

As you know, at Stanford we are committed to supporting departments, institutes and selected centers, but I am well aware that simply stating this commitment does not dissipate the understandable competition for resources. We have tried to address this sense of competition by creating a working document to define the interactions between departments and institutes, but there is no question that strong views of primacy and relative importance persist. This is an internal challenge that we must continue to work on if we are to optimize our broader institutional success. For instance, while I have no doubt that we can make compelling cases to raise philanthropic dollars for specific faculty or departmental initiatives, it is big and bold ideas that leap beyond traditional departmental disciplines that engender the most excitement in donors capable of making major investments in our vision for the future. This has been very clearly the case with the anonymous donor who had invested tens of millions of dollars in our stem cell program or the recent gift of nearly \$40 million for SIM1. So again, we need to find balance between our disciplinary and interdisciplinary initiatives, focusing foremost on how we improve our school – and medical center – as a whole.

5. Excellence, Professionalism and Quality:

I commented above on the importance of assuring excellence in all we do. I also noted that we have been particularly successful valuing and assuring excellence in research. While we have made strides in recent years, I don't believe that we have necessarily had the same laser focus for quality and excellence in our clinical care missions. As I noted in summarizing Mark McClellan's presentation, this is an issue that will take on increasing importance in the years ahead as physician and hospital quality metrics become compared, ranked and published. I should hasten to add that during the past several years there has been such a focus at the Lucile Packard Children's Hospital in conjunction with our pediatric faculty, and, as a consequence, LPCH stands at the acme of excellence when compared to peer institutions in a number of quality and service performance measures. And while there is unquestionable commitment by the leaders of SHC and the School to quality and service performance in the adult programs, there is work to be done to achieve the levels of success we can and must achieve.

In some ways the situation in which we find ourselves in this area may be linked to an occasional over-emphasis on academic performance for clinical faculty and perhaps an under-emphasis on metrics that support clinical leadership and excellence. Our promotions process, which has not evaluated clinical performance or excellence with the same rigor and robustness as scholarship, likely aggravates this. While this is not surprising in an academic institution, it is also not acceptable in an academic medical center striving to be the best among its peers. Accordingly, increased efforts are underway to develop a plan for improvement – which is all the more important in light of the clear emphasis that physician quality and hospital service will play in the immediate future. Again, these efforts will require a number of culture and programmatic changes, and the resolve to achieve success will be a serious challenge for individuals and our entire enterprise. But here we cannot fail.

I also noted that it is important to revisit how we evaluate the quality of clinical performance of our students and trainees. They are entering a new world of standards and expectations and we will not serve them well by not addressing this more formally. This too will require cultural changes – but here too we must be forward thinking and more cognizant of the world which lies ahead.

6. Diversity, Leadership and Balance:

I have highlighted previously that we have considerable work to improving the diversity of our faculty, especially given the success Stanford has achieved in the diversity of its students. I recognize that this must be viewed as a long-term commitment, and I am pleased with the efforts of our new Office of Diversity and Leadership and, in particular, of chairs and faculty leaders who have made special efforts to seek diversity in recruitments. We all agree that we must put excellence first – but we also acknowledge that excellence and diversity are compatible, even if challenging to fulfill. This is an area where our active partnership and commitment will be essential, and where our success or failure is readily measurable. At this point we are nowhere near where we need to be, but I have confidence that there is a broad commitment to improve our diversity, because greater diversity will benefit our entire community and because it is the right thing to do.

In tandem with diversity, fostering leadership is another critical challenge. Certainly leadership takes many forms, such as leadership as a researcher or clinician or in directing or leading programs or initiatives. During the past couple of years leadership training and mentoring have taken place under separate and joint programs sponsored by the School, SHC and LPCH. Each has met with significant success, but there is work to do on two fronts: first, in creating opportunities for as many individuals to participate in leadership training and development as possible, and second, in benefiting from the skills gained in these programs by engaging more faculty in leadership opportunities. Each is important in further enhancing our school and medical center.

Fostering balance for our faculty, given the tremendous challenges faced in meeting rigorous academic and clinical demands, remains a largely unmet goal. I have previously addressed the issues related to creating a more flexible work environment (see: http://deansnewsletter.stanford.edu/archive/10_23_06.html#3), and reports of success have been noted in the Stanford Report (<http://news-service.stanford.edu/news/2007/january24/med-flexible-012407.html>). But these are exceptions. We really need to focus more on the cultural changes that are necessary and the perceptions that map to them. We also need to develop more resources that help young faculty, in my opinion particularly women, through more day care, financial support, time and more. Here one doesn't want to be Pollyannaish or engage in false promises. We simply need to do better – but I readily acknowledge that the pathway to doing so is neither clear nor easy. But this is a major challenge for all of us.

7. Resources and Renewal:

We are fortunate to be at Stanford, which is well endowed compared to most of our peer medical schools and which has many resources at its disposal – and the opportunity to develop new ones. However, all of our resources are limited and to some degree compartmentalized. As I have noted in other writings, I celebrate and support the success of faculty and departments in creating and developing resources and reserves that help to sustain and enhance their activities. At the same time, I know that unrestricted dollars are quite limited and that the central resources within the Dean's Office are shrinking due to programmatic and capital investments we have made to foster new programs during the past several years. Among my highest priorities is to develop additional resources to support our programs and needs throughout the school as well as at the hospitals and university.

The activities directed to securing these resources come in many forms and require many participants: advocating and taking leadership on national or regional initiatives that increase support for biomedical research (e.g., NIH, CIRM); addressing issues and constituencies that impact healthcare costs and revenues; wisely developing resources that may arise from discovery, patents and royalties; and raising support through medical development from foundations, individuals and other philanthropic communities. Because our needs are so significant (see below) we have considerable work to do in this area. But carrying out this work is essential if we are to renew our investment in people and programs.

Ultimately, the contributions we make depend on the excellence of the individuals who are part of our community. It is expensive to recruit and retain the brightest and most creative scientists, physicians and leaders – but it is imperative that we make these investments if we are to enhance our future success. New recruitments not infrequently cost upwards of a million dollars, and new facilities to support education, research and patient care cost tens to hundreds of millions of dollars or more. This is also an enormously competitive process, and, hence, an important aspect of efforts at renewal must also be the education, training and development of future leaders who can help support Stanford as well as other programs around the world. We must also be cognizant of the very real internal tensions and competitions that arise when the need for new resources is significant and the sources from which they can be raised are limited.

While I have no doubt that we each want the success of Stanford to stand proudly, when it comes down to an individual philanthropic donor or foundation, there is an inevitable struggle in balancing the needs of an individual faculty member versus her or his department. Or there are struggles between departments, centers and institutes. Or there is competition between the academic programs championed through the school and the need for clinical facilities for the hospitals. Or there is tension between the medical center needs and those of the rest of the university. These tensions, conflicts and even confrontations are predictable and expected. But what will matter going forward is how we deal with them. If any one individual, group or constituency becomes too self-focused (or indeed selfish) we will not reach the levels of success we must achieve. This is a big challenge, and I don't want to glaze over it with denial or embellish it with hyperbole. It requires forthright discussions, compromises and a consistent focus on how we can help to assure that each member of our community thrives over time. That said, I view this as one of our biggest challenge during the years ahead.

8. Program and Capital Investments:

Coupled with the need and importance for creating new resources and making strategic investments to assure our renewal, we face the practical challenge of balancing our very real needs for facilities against those for programs and investments in people. In my December 4 2006 Newsletter

(http://deansnewsletter.stanford.edu/archive/12_04_06.html), I laid out what amounts to a multi-billion dollar facilities renewal and construction program encompassing the School, SHC, LPCH and PAVAMC that will, hopefully, unfold over the next 10-20 years. Given the need to meet seismic requirements and the rapidly escalating costs of construction in the Bay Area and California (and also Stanford specifically), there is enormous pressure on each of the entities to find the fiscal resources to support new facilities. The sources include loans through debt financing, excess dollars from operations or reserves and philanthropic support. Because the financial demands on each entity are considerable, there will be a constant tension in balancing how much to invest in needed capital improvements versus people and programmatic needs.

Given the limited life-cycle of buildings, the changing requirements for supporting education, research and patient care and the lack of attention to addressing some of these important issues in the past, significant investments in facilities must be made. To do so

will require a focus on compartmentalizing and directing funds that might otherwise be used for programmatic development. And here lies the obvious tension and challenge. If we simply focus on building facilities we run the risk of not adequately investing in our most important resource – creative, energetic and transformative people. Indeed, if we don't maintain some balance between these competing – but highly integrated needs – we could find ourselves with either great new facilities and less excellent (or fewer) individuals to occupy them – or with an inability to recruit or retain extraordinary individuals or to build exciting new programs, simply because we lack adequate space for research, teaching and patient care. This too will be a tough issue to deal with, and it will require leadership, compromise and understanding.

9. Internal and External Challenges:

Often institutions become united by external challenges, but they can also become distracted or fractured by internal differences. When both occur in tandem the results can be devastating. Without question we must anticipate and plan for a number of important external challenges, some of which I have already addressed. It seems inevitable that there will be pressures on research funding for years to come, and we are entering a cycle where clinical revenues will almost surely decline. Further, depending on the changes in healthcare systems and support in California, nation-wide or globally, potential significant rebasing of clinical financing may follow.

While it is unlikely that these changes will occur precipitously, and most will unfold over years, it is essential to do all we can to anticipate them. This means continuing to consider ways to support faculty through potential lapses in grant funding or even declines in overall research support. It means thinking more creatively about how and where we conduct research, whether we rethink the size of research programs or the lab space that supports them. It means giving thought to the scope and size of our education programs and how they are balanced. It will mean accommodating to potential losses of funding for graduate medical education and the need to think critically about how future clinical programs are coordinated. It will require considerable planning regarding the use of information technology, for both academic and clinical programs, and for how we will relate to the global community as part of a world that is becoming more connected – and flatter (as well described by author Thomas L. Friedman). And of course it means being thoughtful and flexible about new facilities, especially with respect to timelines and adaptability, recognizing that considerable flexibility is lost once architectural plans are completed or construction begins.

Our ability to respond to external challenges will be proportionally linked to how well we can coordinate our internal ones and whether we can stay true to our mission as a research-intensive medical school and medical center. It is of course easier to do this when resources for each of our missions – in education, research and patient care – are abundant. But as the resources become challenged and more limited in one or more areas, tensions arise that pit one group against another. We recognize these tensions will be inevitable and that they can create fracture lines that we will need to anticipate and plan for.

10. Moving Forward and Creating Our Future:

An important part of shaping our future, rather than simply reacting to a series of external and internal pressures and demands, is being clear about what we seek to be – both as individuals and as an institution. That is why I have felt that the simple exercise of strategic planning is so important. It is not that a plan is created that lasts forever – or even for years. Rather, a plan compels us to communicate and to better understand where we are aligned and where we are not. Of course this is complicated when multiple missions must be served and, in particular, when there are valid and different interpretations and viewpoints on what should be done, on what timetable and by whom. The yearly exercise of coming together as a leadership group is simply one way of creating alignments. Of course, considerable work must be done throughout the year to sustain those alignments, create new ones or repair the understandable fractures that will inevitably transpire.

To move forward successfully as individuals and institutions we must understand each other's needs – and equally if not more importantly respect them. Whether it is discovery or translational science, the size and scope of our research, education and clinical missions, the depth and breadth of faculty or programs, or the balance between our disciplinary or interdisciplinary efforts, it is important that we assure excellence, professionalism and quality along with effective leadership, increased diversity and an effort to create balance. Doing so will enable us to address the important needs to foster renewal and to garner the resources that support both programmatic and capital needs. Perhaps most importantly we must be sure that we limit internal tensions and fractiousness so that we more effectively address the internal and external challenges we will face in the years ahead. It is with that in mind that we elected to focus on a number of important questions and issues – the responses to which will determine our ability to serve as a leader that creates change and becomes a role model among academic medical center.

The Questions and Issues

In order to address some of the major challenges facing the School during the years ahead, we decided to construct the retreat around six panel presentations, each focusing on a series of major issues. However, we didn't want the discussion to be dominated by the panel. Rather we wanted to make each session as interactive as possible with the retreat participants in order to foster as much dialogue as possible – and of course to be sure that we permitted expression of differing views and the airing of important questions and possible action items. The major goal in raising the issues we chose was to begin a new process of interactive planning designed to develop potential solutions and action items. Thus the major points and issues that arose during the panel discussions are being collated and codified. They will be used to launch new strategic planning groups to help guide future program developments in the years ahead. Accordingly, I will only share the major questions that each panel posed and leave for future reports how we will go about addressing and solving these important issues:

Panel #1: How do we sustain and enhance our strengths and excellence in basic science research in the current NIH funding climate?

Panel chair Dr. Daria Mochly-Rosen (Senior Associate Dean for Research and faculty member in Chemical and Systems Biology) and panel members Ben Barres (Neurobiology), Steve Galli (Pathology), Stuart Kim (Developmental Biology), Roel Nusse (Developmental Biology), Lucy Shapiro (Developmental Biology) and Irv Weissman (Pathology).

Among the major questions the panels considered were:

- *What should be we be doing to provide an environment that continues to support innovation, excellence and scientific breakthroughs in a declining funding environment?*
- *In what ways can we ensure that the most talented and creative scientists see Stanford as the place where they will be able to do their best work?*
- *How can we develop and optimize core technologies to enhance basic research? (Will the methods that produced success in the past continue to work as well in the future?)*
- *What can we do to promote changes in NIH grant review and fund policies?*

Panel #2: What do we need to do to optimize and align educational programs across the University?

Panel chair Dr. Charles Prober (Senior Associate Dean for Medical Education and faculty member in Pediatrics) and panel members Charlie Anderson (Graduate Student in Biological Sciences), Myriam Curet (Surgery), Mark Horowitz (School of Engineering), Larry Kramer (Law School), Michael Longaker (Surgery), Julie Parsonnet (Medicine), John Pringle (Genetics) and Keyan Salari (Graduate Student in Genetics).

Among the major questions the panel and participants addresses were:

- *In what ways does it make a difference to our educational programs that the School of Medicine is part of the broader Stanford University community?*
- *How can our relatively small School of Medicine increase our educational impact?*
- *How do we augment the teaching skills and opportunities of our residents, fellows and postdocs?*

Panel #3: What do we need to do to optimize and align clinical and translational research between our departments and institutes?

Panel chair Dr. Harry Greenberg (Senior Associate Dean for Research and faculty member in Medicine) and panel members Prista Charuworn (Medical Fellow), Mark Davis (Microbiology & Immunology), Ralph Horwitz (Medicine), Tom Krummel (Surgery), Rich Lewis (Molecular & Cellular Physiology), Frank Longo (Neurology) and Bobby Robbins (Cardio-Thoracic Surgery).

Included in the major questions to this panel and participants were:

- *Where does clinical and translational research fit in the various missions of the clinical departments, basic science departments and institutes?*

- *What is needed to make institutes succeed as clinical and translational research engines?*
- *How can we best evaluate and allocate institutional resources (core services, pilot funding, clinical research space, philanthropy dollars, etc) to clinical and translational research between institutes and departments?*

Panel #4: What do we need to do to ensure that the “Stanford Culture” encourages translational and interdisciplinary research across the University and also fosters career development and success?

Panel chair Dr. David Stevenson (Vice Dean and Senior Associate Dean for Academic Affairs and faculty member in Pediatrics) along with panel members Ann Arvin (Pediatrics), Bill Mobley (Neurology), Rick Myers (Genetics), Channing Robertson (School of Engineering), Hannah Valentine (Medicine) and Richard Zare (Chemistry – School of Humanities and Sciences).

Among the questions discussed were:

- *How can we ensure an appropriate balance between team-based and individual scholarship?*
- *How can adapt the “up or out” rules to the needs of a more diverse professoriate?*

Panel #5: What do we need to do to optimize the connections between our research and clinical programs?

Panel chair Dr. Norm Rizk (Senior Associate Dean for Clinical Affairs and faculty member in Medicine) with panel members including: Steve Alexander (Pediatrics), Chris Dawes (LPCH), Henry Lowe (Medicine), Bill Maloney (Orthopedics), Martha Marsh (SHC), Bev Mitchell (Medicine) and Gary Steinberg (Neurosurgery).

Some of the questions considered by this panel and the participants included:

- *In order to support the clinical and translational research mission of the medical center, what features need to be included in the design of the new SHC and LPCH facilities?*
- *How can we ensure the physician coverage (i.e., critical mass) needed to sustain and grow our clinical programs while also supporting non-clinical (i.e., academic) time for physician faculty engaged in clinical and translational research?*
- *What can be done to better connect SHC and LPCH patient information systems with the patient populations needs our clinical and translational research programs?*

Panel #6: What do we need to do to facilitate School of Medicine facilities expansion and renewal?

Panel chair Philip Pizzo (Dean and faculty member in Pediatrics) along with Ryan Adesnik (University Federal Relations), Marcia Cohen (Finance & Administration), Rob Jackler (Head & Neck Surgery/Otolaryngology), Mark Krasnow (Biochemistry), David

Lennox (University Architect), Bobby Robbins (Cardio-Thoracic Surgery), Doug Stewart (Medical Development)

Among the questions that were discussed were:

- *Should we proceed with a plan that requires some of our research programs to be offsite- whether at the VA, North Campus or elsewhere?*
- *How can we approach the use and management of SUMC space in new ways that will ensure its mutually beneficial and efficient use?*
- *The facilities plan is bold and significant – but also very expensive. What are the risks for proceeding with a plan that will require major fund raising as well as support from the Dean's office, departments and university?*

Your Input is Requested

The questions posed above represent an important sampling of the issues discussed at the retreat. I am extremely interested and eager to get as much feedback as possible from throughout our Stanford community. Accordingly, I would encourage students, residents, fellows/postdocs, faculty, staff and alumni to give me their thoughts about any or all of these questions. You can respond to me directly (ppizzo@stanford.edu) or, if you prefer, to Mr. David O'Brien, Director of Strategic Planning (dob@stanford.edu). This is not a gratuitous request – I am truly interested in your feedback and input and believe it will help me to consider additional views and perspectives that can help shape our future as a leading School of Medicine.

Next Steps

We had engaging and robust discussions about each of the questions posed above and additional important issues that were raised. After the discussion points and questions are collated into sets of action items and issues to be addressed, we will assemble work groups comprised of members of our community to address the various issues and action items and develop recommendations. It is conceivable that we will resolve some of these issues in the next months, whereas others may take a year or more. Regardless, we will seek to make progress on a number of fronts since that is the only way that we can assure that we are truly serving as active stewards of our collective future.

Faculty Fellows Program a Success

During the past couple of years the School of Medicine, Stanford Hospital & Clinics and Lucile Packard Children's Hospital have all initiated leadership development programs. While each of these programs has a different focus and set of objectives, they share in common a commitment to preparing a new generation of institutional leaders and creating a supportive and even nurturing community. Among these programs is the Faculty Fellows Program that was initiated and launched by Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership and Julie Mosely, Manager of Organizational Effectiveness for the School of Medicine. In this program a group of 16 faculty met regularly to learn from experienced leaders and to receive mentoring and guidance about leadership, both individually and collectively.

On Monday evening January 29th a “graduation” dinner for the Faculty Fellows was held, which I felt was celebratory and inspirational. All of the fellows shared how they felt the experience of being in this program had changed them and what that might mean for their role as future leaders. Importantly, virtually every individual commented on the important role that their mentors had played in their personal development and how they felt part of a new community – and part of the School of Medicine. Equally importantly, the mentors and faculty came from both basic and clinical science backgrounds, but that distinction diminished in importance as basic science mentors worked with clinical faculty and vice versa – further affirming the importance and possibility of fostering a unified community of excellence at Stanford.

I want to thank in particular Hannah Valentine and Julie Mosely for the tremendous efforts they put into developing this program. Every participant sang their praises – and quite appropriately so. I also want to thank the Faculty Mentors who contributed time and energy to making this program successful. This years faculty mentors included:

- Ann Leung, MD, Professor of Radiology
- Suzanne Pfeffer, PhD, Professor and Past Chair of Biochemistry
- Oscar Salvatierra, MD, Professor of Surgery
- Gary Steinberg, MD, PhD, Professor and Chair of Neurosurgery and Neurosciences

I also want to list the 2006 Faculty Fellows so that those of you interested in participating in future programs can learn more directly about their experiences. They were:

- Janice ‘Wes’ Brown, Associate Professor of Medicine
- James Chen, Assistant Professor of Chemical and Systems Biology
- Clifford Chin, Associate Professor of Pediatrics
- Myriam Curet, Professor of Surgery
- Ricardo Dometsch, Assistant Professor of Neurobiology
- Romona Doyle, Associate Professor of Medicine
- Tracy Doyle, Assistant Professor of Pathology
- Iris Gibbs, Assistant Professor of Radiation Oncology
- Sabine Girod, Assistant Professor of Surgery
- Hayes Gladstone, Assistant Professor of Dermatology
- Anthony Oro, Associate Professor of Dermatology
- Minnie Sarwal, Associate Professor of Pediatrics
- Erick Sibley, Associate Professor of Pediatrics
- Eric Sokol, Assistant Professor of Obstetrics and Gynecology
- Karl Sylvester, Assistant Professor of Surgery
- Sharon Williams, Assistant Professor of Psychiatry

I am proud of the contributions made by each of these individuals to work on behalf of making Stanford a better institution, and I hope that in the years ahead we will continue

to benefit from the transfer of knowledge and skills for noted leaders to the next generation of leaders.

Doctors and Industry: Lessons from the Past

Over recent years there has been considerable attention to the role of doctors in marketing and industry relations. And while our attention has focused on the role of gifts and other financial inducements that lead physicians to cross the boundary between being objective health care providers and being industry marketers (something that we are working to ban at Stanford – see <http://med.stanford.edu/coi/siip/>), Rob and Laurie Jackler have reopened a window into the amusing and disturbing role that doctors played in helping the tobacco industry to promote smoking. Their fascinating work can be seen at the Lane Library and is described on our website at: http://med.stanford.edu/about_photo/. It is a remarkable albeit sad history and serves as reminder of why doctors should not cross the line between being health care providers to marketing drugs and devices – or, in the story told by the Jacklers, promoting something that was ultimately shown to be a serious health hazard.

I want to commend Rob and Laurie Jackler for their efforts to share this story with us.

Connecting Our Elements: Progress on SIM1 and the LKC

The following information is provided by Maggie Saunders, Program Manager for the Learning and Knowledge Center and the so-called Connective Elements Project. Because construction on the connective elements project will begin this spring, it is important you become more aware of what is about to transpire. The good news is that we will soon be getting underway with the first steps in our facilities master plan. Over time this will redefine our medical campus. The other good news is that you can look at this next phase as a health improvement opportunity since it will increase your walking and exercise program. Of course that means that the bad news is that a number of parking spaces will be disappearing, and this will require you to do some planning. Here's the report from Maggie Saunders:

Many of you have heard about or participated in the Connective Elements and/or the Learning and Knowledge Center (LKC) projects. The LKC project will be a new building constructed on the site of the Fairchild Auditorium. It will house new classrooms, an immersive and simulation-based learning center, a conference center, a cafe, the Dean's Offices, student study and social facilities. We have just completed the schematic design phase for LKC project and will seek Design approval at the Land and Buildings Committee meeting of the Board of Trustees on February 12th. We hope to break ground on the LKC during spring or summer of 2008.

The Connective Elements or CE project, however, will start construction imminently. The CE Project addresses numerous site issues, foremost among them to create a front door to the School of Medicine. A secondary goal of the

CE project is to move most service and delivery for the School of Medicine into the underground tunnel network accessed through a central loading dock facility. To accomplish these two goals we need to complete an additional, and significant, utility relocation project and build a new stretch of tunnel in front of the CCSR building. We have just completed the design phases for the Utilities Relocation project and hope to secure project approval at the February 12th Land and Buildings Committee meeting.

We will begin construction with enormous excitement and some trepidation. With construction will come at least three years of dust, noise, and controlled chaos. We will see a significant change in the parking situation to which we have become accustomed. The School of Medicine, as is true of the other Schools at the University, will be moving the majority of its parking to the perimeter of the School outside of Campus Drive. The main parking lot will become a front entry plaza, green lawn and the site of SIM1 and the Central Loading Dock. In short, the parking will move to the next closest areas including the surface parking lots at Stockfarm and the corner of Panama and Campus Drive as well as the parking garages on Roth Way, Stockfarm and in front of the Stanford Hospital. Maggie Saunders has been working with Parking and Transportation to develop the interim parking plans during construction as well as a long term parking plan. There will be a number of efforts to communicate the plans with the School of Medicine community: a Town Hall Meeting on February 26th at 11:30 a.m. in Fairchild Auditorium, as well as signs, departmental presentations and e-mail notices.

In addition to parking there is a significant and concerted effort to clear the tunnels, currently used for storage and -80 freezers. The new model for receiving and delivery to the School requires that the tunnels be dedicated to delivery vehicles and pedestrian traffic. The items in the tunnels have been inventoried, and the lab managers responsible for the inventory have been assembled into a working committee. This group is actively working to identify which items can be emptied and prepared for disposal versus those that must be retained and relocated. Please work with your lab managers to expedite this process as soon as possible.

But on the whole, the excitement far outweighs the trepidation. Towards the end of April we will break ground on the utilities relocation project. This project precedes the CCSR tunnel, Central Loading Dock and the LKC. We anticipate that the utilities work will be mostly completed by Fall 2007 at which time we will begin construction on the new Loading Dock and the tunnel in front of CCSR. Construction of the LKC and SIM1 will follow soon after completion of the dock and tunnel. When the LKC, Connective Elements and SIM1 are complete there will be a new “front door” to the School of Medicine, with a sign, “Stanford University School of Medicine.” In addition to the new facilities in the LKC and SIM1, there will be a beautiful green lawn and entrance plaza marking completion of the first quad in the School’s long-range facilities master plan.

Stanford Institute on Immunity, Transplantation and Infection Hosts Mini-Med School

On Monday evening February 5th the Stanford Institute for Immunity, Transplantation and Infection (ITI) hosted a community education “mini-med school” entitled ***Playing Defense: Understanding your Immune System***. The evening began with a keynote address by ITI Director Mark Davis on “*Making the Most of the Body’s Own Defenses.*” This set the stage for three breakout sections that focused on interesting and exciting areas of research and clinical care. These included:

- Immunity: led by Drs. Gary Fathman, Mark Genovese and PJ Utz
- Transplantation: led by Drs. Andrew Bonham, Stephan Busque and Sam Srober.
- Infection: led by Drs. Karla Kierkegaard, Jose Montoya, David Relman and Lucy Tompkins

Over 200 hundred members of the community attended the evening’s events. I had the opportunity to move among the breakout sessions and was impressed and pleased by the quality of the presentations and discussions – and of course by the interest and appreciation of our community.

Thanks to our Office of Medical Development and especially Ms. June Lang for coordinating this special evening event.

Clinical Transformation at LPCH

The Clinical Transformation Program (CTP) at the Lucile Packard Children’s Hospital (LPCH) involves the implementation of a new care delivery and documentation model supported by a patient-centric electronic health. One of the critical goals of the CTP is to improve patient safety. Dr. Jin Hahn, Professor of Neurology and Neurological Sciences and of Pediatrics and, by courtesy, of Neurosurgery at the Stanford University Medical Center, asked me to update you on the current program status and I thank him for providing the information that follows (also additional background information on the Clinical Transformation Project can be found at:

<https://intranet.lpch.org/links/projectLog/2006q4.html#20061205ctpUpdateAppreciation>.

During past year the project team has been busy activating CDC Growth Charts, Document Imaging, Transfusion Services Orders and Results, and Automated Results Notification via Pager. These are significant accomplishments and I certainly want to commend Dr. Hahn and his team for the progress they have made.

The current year we will bring additional major enhancements. Care Provider Order Entry (CPOE) will be launched in the autumn of 2007 and will replace paper-based orders. Physicians and other providers will be entering their orders directly into LINKS

on LPCH inpatients. Physicians will be able to enter orders from all hospital locations as well as remotely. Verbal orders will only be accepted in limited situations, such as if the care provider is scrubbed, in code situations, or has no LINKS access. Further information about these new functions of LINKS can be found at:

<https://intranet.lpch.org/links/projectLog/2006q4.html#20061205ctpUpdateContents>

Design teams have focused on several critical aspects of successful CPOE implementation including application design, building electronic order sets, and ensuring adequate access to computer devices. The CTP has completed the Planning and Design Phases and is now in the system Build Phase. Dr Hahn and his team will be sending regular communications to the LPCH Medical Staff to update you on the progress they are making. Satellite locations, such as Packard at El Camino, will be brought on-line after stabilization of Phase 2 on the main campus. Changes will be phased in gradually, taking into consideration numerous factors and concurrent changes within LPCH. Additional changes in functionality will be introduced throughout the next several years. These include outpatient CPOE and other ambulatory care workflow enhancements. LPCH is beginning to plan for the future.

Concurrently Stanford Hospital & Clinics is also busy at work on its EPIC implementation and clinical transformation projects and I will provide updates about their progress in subsequent Newsletters.

Offerings and Performances in the Arts and the Humanities

Dr. Audrey Shafer, who directs the Scholarly Concentration in Arts, Humanities and Bioethics, asked me to inform you about some exciting offerings that are coming up in the next couple of months. These include:

- ***Wednesday, February 21st at 12:30 pm***, a violin concert will be given by *Jennifer Wey*, associate concertmaster of the San Francisco Symphony Youth Orchestra will be given in the Stanford Hospital Atrium as part of the Bing Music Series and thanks to a generous gift from an SHC employee who wished to remain anonymous – but to whom we offer our sincere appreciation.
- ***Thursday, February 22nd at 5pm*** *Dr. Richard Kogan*, celebrated concert pianist, psychiatrist and Director of the Human Sexuality Program at New York Presbyterian-Weil Cornell Medical Center, will deliver a concert and lecture entitled “Music and Medicine: the Life, Art and Illness of George Gershwin”. This event will take place in the Fairchild Auditorium.
- ***Wednesday March 7th at 5pm***, The Writers Forum @ Stanford School of Medicine will be held in the Fairchild Auditorium and will include readings by:
 - ***Dr. Daniel Mason*** (UCSF ’04), Palo Alto native and author of the national best seller, “*The Piano Tuner*”, will read from his new book “*A Far Country*”.
 - ***Joshua Spanogle***, Stanford Medical Student and author of the medical thriller “*Isolation Ward*” will read from his forthcoming book, “*Flawless*”.

- **Dr. Audrey Shafer**, Associate Professor of Anesthesia and director of the Stanford Arts and Humanities program, will read from her recently published children's novel entitled "*The Mailbox*".

In addition to these exciting offerings, I have previously mentioned that the School is hosting some new plays that confront biomedical issues which you might enjoy attending. <http://mednews.stanford.edu/releases/2007/february/plays.html>. They are on February 22nd and March 15th.

Awards and Honors

- **Ann and John Doerr Medical Directorship.** On Thursday evening February 8th Martha Marsh and I had the opportunity to formally thank Ann and John Doerr for their \$4 million gift to establish a medical directorship in their name that will be held by the director of the clinical cancer center. The first incumbent of this new directorship is Dr. Steve Leibel. It was a wonderful opportunity to acknowledge the most appreciated donation by the Doerrs and also to celebrate and honor the contributions of Dr. Leibel as the first Ann and John Doerr Medical Director.
- **Michael T. Longaker, Deane P. and Louise Mitchell Professor in Plastic and Reconstructive Surgery**, has been elected to the position of President of the Society of University Surgeons 2007-2008 as the 69th President. The Society of University Surgeons (SUS) is widely recognized as the world's premier organization dedicated to the advancement of surgical sciences.

Appointments and Promotions

- **Deborah M. Alcorn** has been reappointed to Associate Professor of Ophthalmology, effective 2/01/07.
- **Jenifer L. Culver** has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 2/01/07.
- **Jessica S. Donington** has been reappointed to Assistant Professor of Cardiothoracic Surgery, effective 2/01/07.
- **Jonathan D. Feldman** has been promoted to Clinical Associate Professor of Pediatrics, effective 4/01/06.
- **Howard Fenn** has been reappointed to Clinical Associate Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 09/01/06.
- **Neville H. Golden** has been appointed to Professor of Pediatrics (Adolescent Medicine) at the Lucile Salter Packard Children's Hospital, effective 2/01/07.

- **Christoph B. Egger Halbeis** has been promoted to Clinical Assistant Professor of Anesthesia, effective 2/01/07.
- **Thomas H.S. Hsu** has been reappointed to Assistant Professor of Urology, effective 2/01/07.
- **Booil Jo** has been reappointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 4/01/07.
- **Tracy Kuo** has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 1/01/07.
- **Nancy Morioka-Douglas** has been promoted to Clinical Professor of Medicine, effective, 09/01/06.
- **Jane Morton** has been reappointed to Clinical Professor of Pediatrics, effective 11/16/06.
- **Yasodha Natkunam** has been promoted to Associate Professor of Pathology effective, 2/01/07.
- **Sunita Pal** has been promoted to Clinical Assistant Professor of Radiology, effective 2/01/07.
- **Jeffrey H. Reese** has been promoted to Clinical Professor of Urology, effective, 09/01/06
- **Hamed Sajjadi** has been reappointed as Clinical Associate Professor (Affiliated) of Otolaryngology – Head and Neck Surgery, effective 5/01/07.
- **Kathryn J. Stevens** has been reappointed to Assistant Professor of Radiology, effective 2/01/07.
- **Lindsey GC Vokach-Brodsky** has been promoted to Clinical Associate Professor of Anesthesia, effective 10/16/06.
- **Douglas Wallace** has been appointed to Clinical Associate Professor of Cardiothoracic Surgery, effective 1/16/07.
- **Stephen Bryan Williams** has been promoted to Clinical Assistant Professor of Medicine, effective 1/01/07.
- **Dean Winslow** has been reappointed to Clinical Professor (Affiliated) of Medicine, effective 09/01/06.

- **Frances Wren** has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 2/01/07.
- **Joseph C. Wu** has been appointed to Assistant Professor of Radiology, effective 2/01/07.
- **Imad Yamout** has been promoted to Clinical Assistant Professor of Anesthesia, effective 10/16/06.

Dean's Newsletter February 26, 2007

Dr. Larry Mathers: Loss of a Remarkable Teacher, Respected Clinician and Renowned Colleague

On Wednesday night, February 21st I learned that Dr. Larry Mathers had been found dead at his home. The news was a shock and has understandably been met with widespread grief and dismay by students, faculty, staff and friends. Dr. Mathers was a one-of-a-kind person and was loved and respected by the Stanford community, which had been his home and life for more than four decades, and beyond. ***We will be holding a Memorial Service to honor and celebrate Dr. Mathers' life and contributions on Friday, March 9th at 4 PM in the McCaw Hall at the Arrillaga Alumni Center, 326 Galvez Street, Stanford. You are all invited to attend.***

Born in San Francisco, Dr. Mathers attended Stanford as an undergraduate and received a PhD in Anatomy in 1971. Except for two years at the University of Wisconsin, he spent his entire career at Stanford. Over the course of his career, he became one of the most highly regarded and renowned teachers and educators in Stanford's history. He was instrumental in teaching human anatomy to generations of Stanford students, and he did so with dignity and excellence. Indeed, during his career Dr. Mathers received 14 major teaching awards – which must be a record, and a very well deserved one. His accomplishments as a teacher and educator were also recognized by his very recent promotion to Professor in the Teaching Line – a further affirmation of his national and international leadership as an extraordinary teacher. But his accomplishments go much further.

Despite a highly successful career in human anatomy, Dr. Mathers decided to pursue medical training as well, and he received an MD from Stanford in 1982. He then went on to train in pediatrics, neonatology and pediatric intensive care and ultimately became Board Certified in all three areas. He maintained a very active role as an attending physician and Associate Director of the Pediatric Intensive Care Unit, where he provided clinical care as well as education for residents, fellows and students. Indeed, by being actively involved in direct patient care and clinical teaching he complemented his outstanding role as a highly regarded teacher of human anatomy to first year medical

students. I also have no doubt that his compassion and sensitivity as well as clinical acumen in dealing with the sickest of children made him an even more effective teacher and educator of preclinical science – and vice versa. He truly bridged the connection between preclinical and clinical education and earned the respect and admiration of the entire Stanford community. But there is more.

Dr. Mathers was also a committed and dedicated citizen of the School, and he worked with colleagues and the Medical School Faculty Senate to help support and care for students – including those who encountered difficulties. He was always there to help – always willing to give of himself on behalf of others. But this also was only a part of Dr. Mathers.

Larry Mathers had an important life outside the classroom and hospital. He and his wife Mildred Jones-Mathers, who, sadly, died nearly three years ago, were students of Native American Culture, and they spent their vacations visiting different Native American communities. And Larry Mathers was a remarkably talented jazz pianist – and vocalist – who never missed a beat at a party or an event. In fact, even if no one was around he would not infrequently be found playing the piano in the atrium of Stanford Hospital & Clinics to the delight of anyone who had the opportunity to cross the corridors during an impromptu “concert.”

Equally important, Dr. Larry Mathers was a genuinely lovely human being who cared more about others than himself. He was always available, always giving, always reaching out. He shared a part of his life and his humanism with all who wished to receive them – and thus he benefited those whose paths he crossed in numerous sectors of our community.

Death is a part of life and while in medical communities we are more than cognizant of that simple fact, when it occurs suddenly and without warning, especially to someone we love and respect, it leaves us with feelings of great loss. That has been clearly palpable during the past several days as Dr. Mathers’ students, colleagues and friends have grappled, each in their own unique way, with the impact of this very sad news. With that in mind I want to remind you that you can explore and use the Stanford grief website at <http://grief.stanford.edu>, which provides an overview of resources available to our community. If you are interested, students may wish to attend one of the gatherings sponsored by Counseling and Psychological Services, the Deans for Religious Life, and the Residence Deans to share their feelings of loss with one another. There will be such a gathering on Thursday, March 1st in the second floor conference room at Vaden at 5:30 pm (dinner will also be available). And if you wish to share personal comments, reflections or thoughts about Dr. Mathers, we have posted a website and a guestbook that you can access at <http://mednews.stanford.edu/mathers/>.

I know we are all saddened by the loss of such a wonderful colleague and teacher. And while those feelings will linger long into the future, I also hope you will join us to honor and celebrate Dr. Mathers on Friday, March 9th in the Arrillaga Alumni Center at 4:00 pm.

Stem Cell Research in California is Officially Seeded

Twenty-five months following the birth of Proposition 71 and the California Institute for Regenerative Medicine (CIRM), the first research “Seed Grants” were approved by the Independent Citizen’s Oversight Committee (ICOC), of which I have been a member, on Friday, February 16th. It was a historic moment that had as a hallmark the attendance of Governor Arnold Schwarzenegger, whose advance funding of \$150M made the grant awards possible. California now takes a major step forward in becoming the nation’s leader in human embryonic stem cell research. While the ICOC had originally planned to award \$25M of Seed Grants, we increased that amount to nearly \$45M based on the quality of the submissions and the need to truly move the stem cell research agenda forward. It is also remarkable that the amount of money for stem cell research from the NIH for the entire nation this past year was \$38M, and those funds were restricted to the so-called approved cell lines. Those restrictions will not exist with CIRM funds, but it is important to underscore that the research will be conducted with the highest of ethical standards and with attention to assuring that CIRM research grants are appropriately insulated from federal support within the guidelines that are available.

While we must be proud that California will now proceed forward, the results of the highly competitive review process were also quite laudatory to Stanford faculty. Indeed the review process, conducted by leading scientists from outside California, critically evaluated the 231 grant submissions from 36 California institutions. With the expanded funding, 72 grants were ultimately approved for funding, 12 of which were from Stanford faculty (totaling over \$7M). In fact, Stanford received more grants than any of the other 20 successful institutions. The excellence of the Stanford proposals is further affirmed by the fact that they were also among the most highly rated of the approved grants. A listing of the successful Stanford faculty and the focus of their proposals can be found at: <http://mednews.stanford.edu/releases/2007/february/cirm.html>.

I want to offer my congratulations to each of the individuals who were funded – at Stanford and throughout California – and also express my appreciation to those who may not have been successful on this round – but who will likely be so in future submissions. We have lots of work to do in this exciting area of research and I am so pleased that we are finally getting started.

Update on the Stanford Medical Youth Science Program (SMYSP)

At the February 16th meeting of the School’s Executive Committee, Dr. Marilyn Winkleby, Professor of Medicine and Faculty Director of the Stanford Medical Youth Science Program (SMYSP), gave an update on this program and its role in helping to address the crisis in the science and medical education pipeline among minority students. In her presentation Dr. Winkleby drew on her 20 years of experience in directing and evaluating pre-college science education programs. Judith Ned, SMYSP Executive Director, accompanied Dr. Winkleby to this presentation. Over the years SMYSP has

grown into a complementary set of university- and school-based programs, all of which focus on very low-income high school students (see <http://smysp.stanford.edu>).

Dr. Winkleby cited three critical factors contributing to the crisis in science and medical education: 1) too few ethnic minority and low-income students complete postsecondary education; 2) even fewer earn degrees in the sciences and enter medical and health professions; and 3) the problem is accentuated by the rapid increase in ethnic minority and low-income populations, who are at greatest risk of poor health. She pointed out that programs such as SMYSP's 5-week residential summer program afford opportunities for students that school-based programs cannot provide, because they tap into faculty, hospital field placements, and science resources such as anatomy practicums that are not available at other school sites. These experiences are often those that most excite students about science and health careers.

Dr. Winkleby concluded her presentation with the impressive evaluation results from SMYSP. Since 1988, 428 students have completed SMYSP and 96% have been followed for up to 19 years. Ninety-nine percent have been accepted to college. Of those admitted to college or not currently in college, 82% have completed a 4-year college education, with the majority majoring in the biological and physical sciences (58%). Equally impressive, fifty percent of 4-year college graduates are attending or have completed medical or graduate school. Moreover, many of the 4-year college graduates (44%) are becoming or have become health professionals. These are remarkable results, and they attest to the dedication of Dr. Winkelby and all those who work to make the program a successful – and inspiring – experience for the participants.

Dr. Winkleby and the members of the Executive Committee discussed the importance of SMYSP as well as the other pre-college science pipeline programs in the SOM, such as those in immunology, genetics, and cancer biology. They expressed their goal of making Stanford a leader in pre-college science education programs and their hope that efforts will be made through the Stanford Challenge to secure the resources necessary to make this goal a reality. I certainly share their goal – and their hope.

Dr. Rob Jackler Takes on Additional Role as Associate Dean for Continuing Medical Education

During the past several years we have made considerable advances in a number of our medical and graduate student education programs. Going forward I am eager to better align undergraduate medical education with the graduate training that occurs during residency and fellowship. In addition, I believe we have considerable opportunity in continuing medical education (CME).

To address our current status and future challenges in CME I appointed a committee chaired by Dr. Jonathan Berek, Professor and Chair of the Department of Obstetrics and Gynecology, that included representatives from the school as well as Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. The committee highlighted the highly dispersed and sometimes poorly coordinated CME efforts that exist across the medical

center and offered a number of recommendations to better define, align and develop CME programs that are more commensurate with our status as a leading research-intensive school of medicine and medical center. This means establishing a much greater degree of central coordination while also being cognizant of the need for hospital and departmental program development. The services offered by the School's CME office must be value-added and must meet multifaceted needs that range from education and public relations to marketing and compliance. They must also bring value to – and be valued by – the Stanford “brand.”

I am pleased to announce that, based on this assessment, I asked Dr. Robert Jackler, Professor and Chair of the Department of Otolaryngology/Head and Neck Surgery, to become the Associate Dean for Continuing Medical Education, and he has agreed. We envision that for the immediate future this will require about a 15% effort, and we are both confident that this will not interfere with the excellent work he is currently performing as department chair. Dr. Jackler has already begun formulating the early stages of a strategic plan for CME and is considering a number of new initiatives, such as web based learning, simulation based learning and ways of linking the integration of CME with quality improvement – all of which are aligned to our current missions and goals. He will also be seeking better alignment with the Accreditation Council on Continuing Medical Education and greater collaboration between the school and hospital efforts in order to improve our local, regional and national presence in continuing medical education. While it is clear that we have work to do, I am confident that with Dr. Jackler's leadership and his collaboration with the principal stakeholders throughout the medical center, we will make considerable progress in the years ahead.

Medical School Faculty Center Votes on Major By-Law Revisions

On Wednesday, February 21st the Medical School Faculty Senate unanimously approved a major revision of its By-Laws based on a year-long effort that included the establishment last summer of a committee led by Drs. Ron Ariagno, Professor of Pediatrics and Oscar Salvatierra, Professor Emeritus of Surgery, who worked in close collaboration with Senate Chair Dr. Sherry Wren and the Committee of Five.

The major reason for the By-Laws revision was their lack of compliance with expectations of the LCME (Liaison Committee on Medical Education) that the line of authority for medical education be more clearly vested in the Dean of the School of Medicine. As it turns out, the By-Laws had not undergone a major revision for 40 years, since not long after the medical school moved to the Stanford campus. Much has changed in the interim, and a major goal of the By-Laws revisions was to make them more consonant with current practice.

The dominant spirit of the proposed By-Laws is captured in the revised Preamble, which now reads: *The faculty of the Stanford University School of Medicine does establish a Faculty Senate according to these Bylaws, and subject to the provisions of the Articles of Organization of the Academic Council of Stanford University and to the authority of the*

Stanford University Board of Trustees. The Senate shall represent and serve as a voice for the faculty in the School of Medicine. The Senate shall also provide a forum for discussion and communication and shall collaborate with and advise the Dean on matters related to the Senate's responsibilities and on other matters related to the well-being and future of the School of Medicine as well as its faculty and students as desired by the Dean and/or the faculty. The Senate will report to and be accountable to the faculty and will carry out its responsibilities in collaboration with the Dean of the School of Medicine and the academic leadership of the School.

With the approval of the Faculty Senate in hand, the School's Executive Committee will next review the By-Laws for approval. Once that is accomplished they will be sent out to each faculty member for review and approval. If passed, they then go to the President and Board of Trustees for final approval. This rather arduous process is required by the current By-Laws. While faculty will be engaged in this process more formally in the next couple of months, if you wish to review the Faculty Senate proceedings in the interim, they are posted at: <http://med.stanford.edu/senate/>.

Update on Trip Reduction Issues

The Provost has again contacted the Schools to request our attention to trip reduction issues. He said, in part: *"It is critically important for both the university and the surrounding communities that we continue to do everything we can to live within the commute traffic limitations of the GUP....every administrative unit and school must give this effort priority attention and approach this challenge each year with a strong commitment. In addition to using the many successful alternative transportation programs we have in place, as many employees as possible should be encouraged to make the following changes, when appropriate:*

- *Commute to Stanford by public transit, vanpool, carpool, bike, or foot;*
- *Alter work schedules (shift schedules so employees commute out of the peak*
- *periods); or*
- *Telecommute*

Alternative workweek schedules need to be adopted in accordance with certain legally prescribed procedures. Departments should consult with Human Resources for assistance in adopting such schedules and for guidance on telecommuting arrangements. See http://adminguide/22_4.pdf (section 6) for more information.

*I am also asking departments to pay attention to **event scheduling**. If your group sponsors or hosts large events on campus (conferences, seminars, lectures, concerts, large meetings, or other activities), please try to schedule them so that attendees arrive and depart during non-peak commute periods. With the very large number of university activities taking place on campus, controlling event attendee arrival and departure times could have a dramatic impact on our trip counts."*

There are several intertwined issues regarding the General Use Permit, parking, and the move off campus that are timely in this regard. First, commitments that have made to

alternative means of commuting should still be in place. That includes individual commitments made last fall in Phase II of the trip reduction program, as well as departmental commitments made in Phase I, which asked employees to adjust their hours to avoid commuting during peak hours.

Second, this might be a good time to consider giving up your parking sticker and using alternative forms of commuting full time. As you may have heard, the Connective Elements project in the School of Medicine will require the closing of the large south parking lot that extends from the Clark Building to MSOB. This means that parking spaces will be far more difficult to come by, and biking or public transportation will be relatively more convenient. By giving up your parking sticker, you can be refunded for the months remaining in the year, in addition to joining the Commute Club and thereby accessing all of its benefits and becoming eligible for Clean Air Cash.

Third, it is extremely important that events held at the School of Medicine do not add to the burden of traffic during peak hours. Therefore, please be sure to schedule any events in such a way that individuals are not required to drive onto or off of campus during peak hours.

Finally, now that spring is around the corner, this is an excellent time to consider, once again, biking to work. There are numerous advantages to that and other alternative commuting methods: exercise, stress reduction, being good to the environment! There are many resources that can help you consider and make alternative commuting methods; for a start, try <http://www.511.org/>. And please do not forget to complete the on-line Parking & Transportation Survey that was emailed to everyone last week; it takes only a minute to complete. Thanks to everyone for your efforts to reduce the number of peak hour trips you make to campus.

Thanks and Farewell to Dr. Ted Sectish

On Tuesday evening, February 20th pediatric residents and faculty gathered in the Arrillaga Center to offer their appreciation to Dr. Ted Sectish, who is leaving Stanford to become the Program Director for Graduate Medical Education at the Children's Hospital, Boston as well as the director of the Future of Pediatric Education for the Federation of Pediatric Organizations. Dr. Sectish has been the Program Director at the Lucile Packard Children's Hospital since 1993. During that time he has done an outstanding job in helping to recruit outstanding trainees and in developing a wonderful and highly supportive environment for resident education. He has also played an important role in many of the School's education initiatives and was instrumental in the process of revising the New Medical Student Education Curriculum that went into effect in 2003. Dr. Sectish is widely viewed an outstanding teacher – as evidenced by numerous teaching awards at Stanford – as well as a compassionate and exceptionally knowledgeable pediatrician. He is a caring person and is much admired by the pediatric housestaff and faculty – and he will certainly be missed. I want to add my thanks and appreciation to Dr. Sectish for his many accomplishments at Stanford – and wish him well in Boston.

Awards and Honors

- **Dr. Scott L. Delp**, Professor of Bioengineering, Mechanical Engineering and, by courtesy, of Orthopaedic Surgery, was appointed the Charles Lee Powell Foundation Professor of Engineering. Congratulations Dr. Delp.
- **Dr. Michael T. Longaker**, Deane P. and Louise Mitchell Professor, Director of Children's Surgical Research, Deputy Director of Stanford's Institute for Stem Cell Biology and Regenerative Medicine and Director, Program in Regenerative Medicine, Stanford University, Department of Surgery, Division of Plastic and Reconstructive Surgery, has just been elected 69th President of the Society of University Surgeons. Congratulations, Dr. Longaker.
- **Dr. Alison L. Marsden**, Post Doctoral Scholar in Pediatrics, has been awarded the Burroughs Wellcome Fund's Career Award at the Scientific Interface, for the scientific excellence and innovation of her research proposal and the potential to establish an independent research career at the interface between biology and the quantitative, physical, and theoretical disciplines. Congratulations, Dr. Marsden.
- **Dr. Doug Owens**, Professor of Medicine and, by courtesy of Health Research and Policy, has been awarded the prestigious Under Secretary's Award for Health Sciences Research, for his two decades of distinctive research in health outcomes and health care policy. Please join me in congratulating Dr. Owens for this special honor and recognition.
- Two students have been awarded the prestigious 2007 Paul and Daisy Soros Fellowship, created to support graduate study of New Americans:
 - **Amit Kaushal**, graduate student in Biomedical Informatics, is pursuing an MD/PhD at Stanford.
 - **Keyan Salari**, graduate student in Genetics, is pursuing an MD/PhD at Stanford.

Appointments and Promotions

- **Olivia R. Martinez** has been promoted to Professor (Research) of Surgery, effective 3/01/07.

Dean's Newsletter March 12, 2007

A Discussion on Universal Health Insurance

On Monday evening, February 26th I was pleased to be invited by several of our Stanford medical student associations to join Professor Victor Fuchs in a dialogue on universal health insurance and on some of the recent state-based health care proposals that have emerged over the past year. Perhaps even more than the discussion itself, I was extremely

gratified to see how many students participated in the seminar, which I saw as an indicator of the relevance and immediacy of this topic.

In a poll reported by the New York Times on March 2nd, “a majority of Americans say the federal government should guarantee health insurance to every American, especially children, and are willing to pay higher taxes to do it” (http://www.nytimes.com/2007/03/02/washington/02poll.html?_r=1&oref=slogin). But Professor Fuchs observes that other polls have also indicated that, while Americans want health care reform, this means many different things to different individuals, and there is not a consensus on whether this should be a government-based, insurance-based, market-based, etc. solution. Perhaps the only area of agreement is that what we have now – which is not a health care system at all – is not working very well. The costs of health care continue to rise along with the numbers who are uninsured, and dissatisfaction is becoming more and more the norm for both providers and consumers. Further, as I have indicated in previous commentaries, despite the fact that we spend more than any other nation on health care (now 17% of the GDP), we are not leading the world in important outcome metrics – except for how much we spend on administrative overhead, where we are clearly number one.

I readily acknowledge that I am by no means an expert in health care policy *per se*. But I have been part of the health care system for over three decades and have personally observed its continued deterioration – although I have to say that it never got off to a good start when the employee based system we have today was initiated as a wage and price control during the Second World War. Sadly, attempts both before and since then to develop an organized health care system in the USA have failed for a variety of reasons, not least of which have been countervailing pressures (largely economic) by doctors, the insurance industry, the pharmaceutical industry and others. The attempts to correct the escalating costs of health care by market forces has, to a large extent, also failed, in my opinion, and the time has come for much more sweeping changes. But while the American public seems increasingly to support the need for change, the personal choices and likely sacrifices that will need to be made are hardly matters of consensus.

Because of the lack of a coordinated federal health care policy (although proposals are being configured rapidly by both Republican and Democratic presidential hopefuls in anticipation of the 2008 elections) several states have come forward with health care plans. In April, 2006, Massachusetts was among the first to announce a plan for universal coverage – although to date the plan has yet to be enacted and the costs are purported to be much higher than previously projected (see also the May 18 2006 issue of the *New England Journal of Medicine* entitled “Can Massachusetts Lead the Way in Health Care Reform” by SH Altman and M Doonan - <http://content.nejm.org/cgi/content/full/354/20/2093>). And of course, in California Governor Schwarzenegger announced a plan for universal health insurance in January, 2007. While these state plans are of interest – and demonstrate that the failure of a federal policy will result in local or state-based efforts – the fundamental issues remain unaddressed. For instance, they are still based on using market forces to contain cost. But at least these efforts heighten awareness and provoke further discussion – although unless

the dialogue becomes really engaged and effective in creating a solution, a crisis point will occur, especially when the Medicare Trust Fund becomes bankrupt a decade from now.

While the methods for solution are problematic and may be difficult to enact, the general principles of the Schwarzenegger Health Care Proposal have merit. The Governor's plan addresses the need – at least conceptually – to focus more on health promotion and wellness, recognizing as it does that we spend too much on the care of diseases whose root causes might be preventable if more resources were applied to addressing underlying problems. A good example, of course, is obesity and all the co-morbidities associated with it – just as tobacco use is unequivocally associated with serious disease. In addition, the Governor's plan recognizes that 6.5 million Californians are uninsured and that a minimum level of coverage must be in place for all. The proposal addresses coverage of children below the federal poverty level (FPL) as well as uninsured legal residents and even uninsured individuals without a “green card.”

To meet these goals, the Governor's plan requires all Californians to have health insurance coverage and indicates that this will be provided by a combination of Medi-Cal (proposed to be increased “almost” to Medicare levels) and Health Family Program Benefits. Further, there would be an employer mandate for those with >10 employees to either offer insurance or pay 4% of payroll into a subsidized purchasing pool to help cover individuals earning less than 250% of the FPL. Insurers would be expected to limit the percentage of premiums to administrative costs and profit to 15%. In addition, hospitals would be expected to contribute 4% of gross receipts and physicians 2% of gross receipts. While it is important to spread the responsibility, one can only be suspicious of how the politics of such a plan will play out in the efforts to enact it.

Other facets of the plan focus on information technology, quality and efficiency. These too are important since the costs for new technologies and the lack of attention to lower cost solutions serve as serious health cost drivers. Equally notable, to a large extent the Governor's plan is still built on market-based solutions, and it ignores the fact that the legislature voted for (but the Governor vetoed) the single payer California Health Insurance Reliability Act sponsored by Senator Kuehl last year. Ironically the plan to enhance Medicaid funding also comes at a time when the President's budget is seeking to reduce the investment in Medicaid.

I have previously commented that I remain partial to many of the principles of a single payer system, although I fully recognize the complexities of enacting such a system in the USA in the foreseeable future. In our discussion with the medical students, however, Professor Fuchs and I were united in our view that the current employer based system is not tenable over time. I have also previously commented on the health care voucher system proposed by EJ Emmanuel and VR Fuchs (see *N Engl J Med* 2005; 352:1255-1260), which I view as a viable alternative. It includes ten basic components: 1) Universality, in which every American under 65 years would receive a voucher guaranteeing health care services from a qualified insurance company or health plan; 2) Free Choice of Health Plan; 3) Freedom to Purchase Additional Services using personal

after-tax dollars; 4) Funding by an Earmarked Value-Added Tax based on personal consumption; 5) Reliance on a Private Delivery System; 6) End of Employer-Based Insurance – which would be phased out; 7) Elimination of Medicaid and other Means Tested Programs; 8) Phasing Out of Medicare – which would be replaced in time by the voucher system; 9) Administration – wherein management and oversight would be done by a Federal Health Board that would review and modify benefits through regional boards; and 10) Assessment of Technology and Outcomes through an independent Institute for Technology and Outcomes Assessment. While still sustaining the current insurance based models, a system like the one proposed by Emmanuel and Fuchs has considerable merit.

It seems clear that over the next couple of years a number of health care proposals will come forward. There does appear to be an increasing convergence between public dissatisfaction with the current “non-system,” rising costs, lack of coverage and the lack of time available to consumers by health care providers. But most of the solutions will be at the margin and few will address the underlying problems – which is unfortunate, since the crisis will surely loom to even greater proportions in the next decade, when Medicare funding becomes threatened. But perhaps by then our nation will be ready for the changes that inevitably need to come forward if we are to have a fair and more reliable health care system in the United States of America. In the meantime, I am pleased that our students are concerned, interested and engaged in these issues and hope that each in his or her own way will become leaders and advocates for health care reform – and that some actually play a truly transformational role in the future.

A Bright Light Focus on Quality

For all the right reasons, a focus on providing the highest quality clinical services (as judged by various external metrics) along with the best patient service and most advanced and compassionate medical care must be among our most important goals and objectives. And as I have noted previously (see:

http://deansnewsletter.stanford.edu/archive/02_12_07.html), and you are likely well aware, quality metrics are rapidly becoming the yardsticks to compare and contrast clinical programs at hospitals and medical centers. They will increasingly be used to guide payments to doctors and to hospitals – through Medicare and private insurers. And they will become publicly available standards that patients will use to determine where to seek their personal medical care. While there are many concerns that can be expressed about which metrics to use or how they compare to community versus academic institutions, the reality is that some quality metrics are already being used and will be increasingly used in the years ahead. It is certainly important to perform well in whatever comparative assessments are made – but it is equally if not more important to strive to achieve the highest quality performance simply because that is the right thing to do.

Already various institutions are posting their internal results and outcomes. And some external metrics are now posted – including the results of the Child Health Corporation of America (CHCA) – which “is driving children's hospitals to the highest level of performance by creating cultures of improvement and a data-driven foundation for safe,

waste-free, error-free care” (see: http://www.chca.com/company_profile/pi/index.html). It is notable that among the 41 children’s hospitals sharing data and performance results through CHCA, our Lucile Packard Children’s Hospital has fared among the very best. Thanks to the efforts of numerous faculty and staff, and with the support and leadership of LPCH administration and the Board of Directors, a culture of quality performance has been developed over the past several years that is winning national acclaim. Most recently LPCH won the “Race for Results” award for its “Rapid Response Team” project – an award given to only two children’s hospitals each year (an honor made even more significant by the fact that LPCH also won this award in 2005!). This is just one of a panoply of quality driven goals and objectives that have been established under the leadership of Dr. Paul Sharek, Assistant Professor of Pediatrics and Medical Director of Quality Management and his excellent staff.

Serious efforts are also underway at Stanford Hospital & Clinics (SHC) to be a leader in the quality of care. To further enhance these efforts Martha Marsh, President and CEO of SHC, and I charged a working group led by Dr. Norm Rizk, Berthold and Belle N. Guggenheimer Professor of Medicine and Senior Associate Dean for Clinical Affairs, and Dr. Kevin Tabb, Chief Quality and Medical Information Officer at SHC. The working group includes clinical department chairs, medical staff and patient care service representatives, among others. The goal of this working group is to develop the mechanisms and cultural transformations necessary to enable SHC to become a “top 10” institution in quality of care. This goal will translate into actions that will take place at the clinical department or division level and that will result in both short term measures of success as well as the long term changes necessary to sustain high quality programs.

The group is working diligently and will be making its report by April, 2007. The results of their work will lead to changes at both the individual faculty and physician level and at the levels of departments, the school, and the hospital. We are intent on making the necessary changes – and being accountable for them – since this is an area where we must do as well as possible even though we recognize that there is a considerable amount of work and effort required to do so. As in all process changes, these will require cultural changes in tandem with serious attention to defined quality metrics – but this is essential if we are to be a leading academic medical center. More will follow on this important topic in subsequent Newsletters.

The Stanford Challenge and Stanford Medicine

I have previously written about the Stanford Challenge (see: http://deansnewsletter.stanford.edu/archive/10_23_06.html), the \$4.3B campaign launched in October 2006 around a series of major themes, including, among others, the Initiative on Human Health, Energy and the Environment, International Initiatives, and Educating Leaders. In recent weeks we have had the pleasure of announcing several major gifts as part of the Stanford Challenge: a \$5M contribution from Akiko Yamazaki and Jerry Yang for the Learning and Knowledge Center and a \$33M gift from Lorry Lokey for the Stanford Institutes of Medicine 1, which will focus on Stem Cell Biology and Regenerative Medicine. These are wonderful contributions, and they join many

others we have been fortunate to receive in recent months and over the past several years. They are all critical to helping Stanford Medicine become the transformational leader of the 21st century that it can – and must - become.

But we have a very long way to go, given the scope and depth of our plans. Among these is the bold and ambitious reconstruction of the medical center – including the School of Medicine, Stanford Hospital and Clinics and the Lucile Packard Children's Hospital. Indeed I presented the range of facilities projects that will unfold during the next 10-20 years in my December 4, 2006 Newsletter on Planning the Future of the Medical Center (see: http://deansnewsletter.stanford.edu/archive/12_04_06.html). Importantly, this plan transcends bricks and mortar – although it certainly requires new foundations. Now that it has been nearly 50 years since the School of Medicine moved to Palo Alto and reshaped the face of biomedical research and academic medicine, we have the opportunity to plan for the next fifty years and beyond. And we are uniquely poised to do so.

During the past 50 years, Stanford Medicine has achieved national and international prominence. And importantly, we are now a medical center that is seen by our peers to be “on the move.” We have intentionally aligned our missions in education, research and patient care. Building on our rich history of excellence in discovery science, we are putting into place additional plans to further enhance and develop our foundations in research. We are also defining the future of medical and graduate education and the facilities that will support and develop them. Bringing basic and clinical scientists together is a key theme in the Stanford Institutes of Medicine, and we will be developing new integrating cross-connections with genomics and human genetics, molecular imaging and informatics. Equally importantly, we are linking our efforts to translate discoveries with our clinical partners at SHC and LPCH.

To help facilitate these connections and, more importantly, to further enrich them, we have formed a Campaign Executive Committee that links medical development opportunities between the School and SHC. We have done this separately with LPCH but ultimately need to bring all into alignment. The new Executive Committee held its first meeting on Tuesday, February 27th and will meet biweekly hereafter. The Committee includes, Martha Marsh, Doug Stewart, Barbara Clemmons, Amelia Alverson, John Ford, Denise O'Leary, John Freidenrich, and myself. We anticipate that, by combining medical school and hospital leaders with medical center and university development leaders and trustee volunteers, we can coordinate and address the critically important challenges that lie ahead. The tasks are daunting but, taken one piece at a time, are achievable – as long as we stay connected and keep focused on the important mission that stands before us.

In tandem with the Campaign Executive Committee, which will provide an overarching focus, we have defined key initiatives that focus on the interconnections between our academic and clinical programs. Each of these will have Campaign Council and two of them, the Leadership Council on the Learning and Knowledge Center and the Leadership Council on the Cardiovascular Institute, met this past week. Both of these groups have

assembled outstanding community volunteers who will work with Institute Directors, clinical leaders and medical development staff to move our important initiatives forward.

Updates on the Faculty Appointment and Promotion Process

At the March 2nd meeting of the School's Executive Committee, Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, presented an update on activities in the Office of Academic Affairs (OAA). I was unable to attend this meeting due to illness and so this report comes from Dr. Stevenson and Judith Cain, Assistant Dean for Academic Affairs.

Dr. Stevenson began by reporting on the progress that has been made in implementing recommendations from the School-wide Task Force on Appointments and Promotions, which was chaired by Dr. Robert Jackler from 2004 to 2006. Charged with streamlining as much of the excessive bureaucracy as possible while preserving the integrity of appointment and promotion policies and processes, the Task Force targeted several areas for improvement. These included the completion of all reappointment and promotion actions in as short a time as possible and a reduction in the need for and length of interim appointments. The goal is to have the candidate's appointment process completed *prior* to his/her official start date at Stanford. The Task Force also recommended the creation of a web-based system to manage the preparation of, and collection materials for, the appointment forms used to recommend professorial appointments, reappointments and promotions.

Dr. Stevenson said that his office has concentrated most of its efforts on improving on-time performance rates for reappointments and promotions. Toward that end, each candidate coming up for reappointment or promotion now receives notification from Academic Affairs confirming initiation of the review one year in advance of the conclusion of the current appointment date. The Office of Academic Affairs has also developed and communicated month-by-month timelines to departments, which is proving to be an important tool in completing these reviews on time. In addition, Academic Affairs now checks in with departments at two, four and six-month intervals to monitor the progress of the reviews, which allows early intervention when problems arise. Dr. Stevenson noted that this investment of time and energy is beginning to yield positive results. Beginning at the low 2003-04 benchmark of 12%, the on-time rate has now more than tripled and continued steady progress is anticipated.

With respect to appointments requiring interim arrangements while awaiting long form preparation and approval, the actual number (approximately 75% of all new appointments) has remained high over the last three years. However, the duration of these appointments has decreased from nine to six months. Through closer management and oversight, Academic Affairs is redoubling its efforts to make further inroads in achieving the Task Force's recommendation to reduce the number and length of interim appointments.

A centerpiece of the Task Force's recommendations was the creation of a web-based system to manage the preparation of, and collect materials for, the appointment forms used to recommend professorial appointments, reappointments and promotions. Dr. Stevenson introduced Phil Constantinou, Associate Chief Information Officer in the Office of Information Resources and Technology, who presented a demonstration of FAST/FAC, which is poised to streamline and transform the way that these actions are carried out. The first phase of the project, which will allow departments to view individual appointment and leave history, manage long form preparation and process and generate automatic deadline notifications, is set for release during the summer of 2007.

Dr. Stevenson also announced that he has formed a Task Force on the Medical Center Line Professoriate to review the current status of the line and make recommendations to further clarify expectations for their faculty. Chaired by Dr. Stevenson, members of the Task Force are Maurice Druzin, Obstetrics and Gynecology and Associate Dean for Academic Affairs; Ann Leung, Radiology; Frank Longo, Chair, Neurology and Neurological Sciences; Stephen Roth, Pediatrics; Geoffrey Rubin, Radiology; Stephen Ruoss, Medicine; Sherry Wren, Surgery; and Paul Yock, Medicine and Bioengineering.

He also reported that a committee has been established to review appointments, reappointments and promotions in the Clinician/Educator line. Patterned after advisory groups that evaluate similar actions in the professorial lines, the new Clinician/Educator Appointments and Promotions Committee is chaired by Dr. Druzin and its members include the following five clinical professors: Ronald Cohen (Pediatrics), Peter Moskowitz (Radiology), Janice Lowe (Pediatrics), Dean Winslow (Medicine), and Nancy Morioka-Douglas (Medicine.)

I want to thank Dr. Stevenson and the Office of Academic Affairs staff for their many efforts to improve the faculty appointments and promotions processes. The progress to date is very encouraging, and I look forward to further updates in the months ahead.

Carla Shatz Will Join Stanford as Next Director of Bio-X

I am very pleased that Dr. Carla Shatz, currently the Nathan Marsh Pussey Professor and Head of the Department of Neurobiology at Harvard Medical School, will be rejoining Stanford University as the Director of Bio-X, where she will also be a faculty member in Biological Sciences and Neurobiology. We have also been pleased to have Dr. Shatz as a member of the School of Medicine's National Advisory Council – where she has served with distinction – and where she will be surely missed!

Dr. Shatz will be replacing Dr. Matt Scott, who has served as the Chair of the Bio-X Scientific Leadership Council during the past several years. During that time Bio-X has evolved as one of the signature programs of interdisciplinary research and education at Stanford – as well as nationally. And the Clark Center, home of Bio-X, stands as a model of excellence in fostering novel programs in research among the biological, physical and engineering sciences. Professor Scott and his colleagues have done an excellent job in fostering opportunities for new innovations –among both trainees and faculty – and,

consequently, Bio-X has become one of the central pillars in the Initiative on Human Health. On behalf of the School of Medicine, I want to offer my praise and appreciation to Dr. Scott for his many wonderful achievements – both for his leadership of Bio-X as well as in his role as an outstanding faculty member.

Dr. Shatz will further the efforts of Bio-X and will also continue her own excellent research as a neuroscientist, which has been focused on how the patterns of precise and orderly connections found in the adult central nervous system are achieved during development. Her return to Stanford is being met with considerable enthusiasm throughout her community, and we are all pleased to be welcoming her back to a new role – and to wonderfully exciting opportunities.

Honoring and Celebrating the Life of Dr. Larry Mathers

In the last issue of the Dean's Newsletter (<http://deansnewsletter.stanford.edu/>) I told you about the tragic loss of our beloved teacher, scholar, clinician, colleague and friend, Dr. Larry Mathers. On Friday, March 9th several hundred of Dr. Mathers' students, colleagues, family and friends gathered in the Arrillaga Alumni Center to honor and celebrate his life in its many dimensions and remarkable contributions. We had an opportunity to see the roots of Larry's love of music, leadership, and scholarship – and of Stanford - emerge from his childhood days. We had the privilege of witnessing the impact of his teaching, mentoring, and dedication in the words of his students and colleagues. And we had the pleasure of listening to music from friends and colleagues who sang with Larry and also to hear Larry's own voice and music and, in doing so, be reassured that his spirit lives on. We will miss Larry deeply and recognize that an individual as kind, deep, humble and variegated as he was will never be replaced. But we are all better for having known and worked with him or for having been mentored and guided by him – and that will sustain, along with his memory and the sounds of his voice and piano.

If you wish to make a contribution in Larry Mathers' name you can do so to any of the following organizations (please note on check that it is in memory of Dr. Larry Mathers):

- Emerald Glen Home – a residence facility for developmentally disabled adults
1101 Walpert Street
Hayward, CA 94541
- Stanford Department of Anatomy Gift Fund
326 Galvez Street
Stanford, CA 94305-6105
- Stanford Pediatric Intensive Care Unit Gift Fund
326 Galvez Street
Stanford, CA 94305-6105

Awards and Honors

- **Dr. Pat Basu and Dr. Roni Katz** have just been awarded the AMA Excellence in Medicine Awards for Leadership. Congratulations!
- **Dr. Michael Longaker** has been selected by Michigan State University (his alma mater) to receive the Distinguished Alumnus Award from the Michigan State University Men's Basketball Program. Dr. Longaker was a member of the Varsity Basketball Team from 1976 to 1980, and a member of the 1979 NCAA Men's Championship Basketball Team. Congratulations!
- **Dr. Craig Albanese** was installed as the first John A. and Cynthia Fry Gunn Director of Pediatric Surgical Services at the Lucile Salter Packard Children's Hospital on Wednesday evening, February 28th. This wonderful gift from John and Cynthia Fry Gunn continues their legacy of remarkable support for the University, Medical School and LPCH. It is most fitting that Craig Albanese is the first incumbent of this new Directorship. Craig is an internationally recognized leader in pediatric surgery and especially minimally-invasive and fetal surgery. He joined the Stanford community in 2002 and has quickly become established as one of the true leaders of Stanford Medicine and LPCH. Please join me in congratulating Dr. Albanese for this honor and in thanking John and Cynthia Fry Gunn for making the Directorship a reality.
- On Monday evening, March 5th, Stanford Hospital and Clinics and the School of Medicine honored three outstanding individuals for their contributions to patient care and SHC. The three individuals included:
 - **Martin I. Bronk, MD** for his services as a Member of the SHC Board of Directors – which he did with true excellence
 - **Bruce D. Feldstein, MD** as the first recipient of the *Isaac Stein Award for Compassionate Care*
 - **Norman W. Rizk, MD** as the first recipient of the *Denise O'Leary Award for Excellence*

Please join Martha Marsh and me in congratulating these three outstanding physicians.

Appointments and Promotions

- **Joachim F. Hallmeyer** has been appointed to Associate Professor of psychiatry and Behavioral Sciences, effective 3/01/07.

Dean's Newsletter

March 26, 2007

A Terrific Match Year

Although ten days have passed since the results of the 2007 National Resident Matching Program were announced on Thursday, March 15th, the glow has certainly not faded and for good reasons. Our graduating students had a terrific match year. Across the nation, 15,206 students from the 125 allopathic schools of medicine along with 12,738 students from schools of osteopathy, offshore schools and international students applied in the Match. Of these, 93.4% of the US medical school graduates “matched” compared to 73.4% of the second group. At Stanford, 72 students participated in this year's match – and 100% matched, more than 85% with one of their top three choices. Equally importantly, virtually all of our graduates will be participating in top-flight internship/residency programs. Most (45%) will remain in California, with the next most popular states being Massachusetts, New York and Washington. Overall, approximately 20% of this year's graduates will remain in a Stanford training program, 11% will be at UCSF, and 10% at Harvard programs. Other centers with four or more Stanford students joining residency programs are UCLA, Columbia, and University of Washington – and some 20 other major academic medical centers across the nation will have one or more of our graduates.

As I have mentioned in previous reports, popularity for various residency programs changes over the years. Stanford students are both similar as well as different compared to national peers. Medicine, pediatrics and surgery (along with surgical specialties) are the most popular – but this year eight students will be going into Radiation Oncology – which must be a record number among any medical school!

This year's Match included students who began with our New Stanford Curriculum in 2003 as well as students who have completed 5 or more years at Stanford. We have reason to be proud of each of them. In case you haven't seen the list, here is where our students will be going:

Stanford University School of Medicine 2007 Residency Match Results

Abnoui, Freddy	UC San Francisco-CA	Orthopaedic Surgery
Anderson, Ellen	Stanford Univ Progs-CA	Medicine-Preliminary
	Stanford Univ Progs-CA	Radiation Oncology
Bakri, Amit	Mt Sinai SOM/Cabrini-NY	Medicine-Preliminary

	Brigham & Womens Hosp-MA	Radiology-Diagnostic
Berquist, Rebecca	Stanford Univ Progs-CA	Pediatrics
Chacon-Lopez, Quetzalsol	UC San Francisco-Fresno-CA	Emergency Medicine
Chan, Ian	Brigham & Womens Hosp-MA	Surgery-Preliminary
	New York Eye & Ear Infirm-NY	Ophthalmology
Chang, Gwendolen	Cedars-Sinai Medical Center	Internal Medicine
Chao, Annie	O'Connor Hospital-CA	Family Medicine
Chavez, Marisa	Santa Clara Valley MC-CA	Obstetrics-Gynecology
Chen, Richard	Santa Clara Valley MC-CA	Transitional
	Stanford Univ Progs-CA	Dermatology
Chow, Amy	Stanford Univ Progs-CA	Pediatrics
Dorth, Jennifer	Santa Clara Valley MC-CA	Transitional
	Duke Univ Med Ctr-NC	Radiation Oncology
Edgerley, Laura	Stanford Univ Progs-CA	Emergency Medicine
Enriquez, Maria Melissa	Harbor-UCLA Med Ctr-CA	Transitional
	UCLA Medical Center-CA	Radiology-Diagnostic
Forsythe, Kevin	Kaiser Perm-Santa Clara-CA	Medicine-Preliminary
	Mt Sinai Hospital-NY	Radiation Oncology
George, Adia	Northwestern McGaw/CMH-IL	Pediatrics
Gonzalez, Oscar	Stanford Univ Progs-CA	Internal Medicine
Green, Aileen	U Wisconsin Sch of Med & Pub Health-WI	Family Medicine
Hanft, Simon	NYP Hosp-Columbia Univ Med Ctr-NY	Surgery-Preliminary
	Columbia University-NY	Neurological Surgery
Harrington, Katherine	Stanford Univ Progs-CA	General Surgery
Hilgenberg, Sarah	U Washington Affil Hosps-WA	Pediatrics
Hong, Wan-Jen	Stanford Univ Progs-CA	Internal Medicine
Hope, Thomas	Kaiser Permanente-SF-CA	Medicine-Preliminary

	UC San Francisco-CA	Radiology-Diagnostic
Howard, Neva	NYP Hosp-Columbia Univ Med Ctr-NY	Pediatrics
Ishida, Julie	UC San Francisco-CA	Internal Medicine
Johnson, Khaliah	Johns Hopkins Hosp-MD	Pediatrics
Keller, Steven	Massachusetts Gen Hosp-MA	Internal Medicine
Ketchum, Eric	U Washington Affil Hosps-WA	Internal Medicine
Ketunuti, Melissa	Georgetown Univ Hosp-DC	General Surgery
Kirschen, Matthew	Stanford Univ Progs-CA	Pediatrics
Kunnavatana, Sermsin	Stanford Univ Progs-CA	Trans/Anes Santa Clara

In addition, students from across the nation will be joining some 22 Stanford Programs at Stanford Hospital & Clinics, Lucile Packard Children's Hospital, the Palo Alto VA Medical Center and Santa Clara Valley Medical Center. Our various Program Directors and clinical department chairs have expressed their pleasure with various departmental Match results – so the level of happiness is high. Congratulations to all!

Stanford Excels Again in Competition for Stem Cell Funding

On Friday, March 16th the Independent Citizens' Oversight Committee (ICOC) for the California Institute of Regenerative Medicine announced the approval of an additional \$75.7M of funding for established scientists involved in stem cell research. In this latest round of grants, 29 were awarded to an applicant pool of 70 investigators from 23 institutions. Stanford received six of the awards and when one of our recent recruits (Dr. Rene Reijo Pera from UCSF) is added, we will have 7 of the 29 Comprehensive Awards (totaling \$17,678,661). Adding in the recent SEED Grants (where Stanford also had top billing) and the Training Grant (which received the highest score in the competition), Stanford has received 20 of the 119 awards for a total of \$28.9M. Clearly this is a terrific success and signifies that high quality of our faculty. But it is also a beginning – and a recognition – that the hard work of advancing knowledge in stem cell research and regenerative medicine is truly underway. Obviously we are all hopeful that this will be the beginning of real progress. Congratulations to all!

National Advisory Council Reviews Strategic Plans and Programs

On Monday, March 19th we had our fourth annual site visit by the School of Medicine's National Advisory Council (NAC). The NAC was appointed almost five years ago to review the strategic directions of the medical school and report their findings and observations to the Provost and President. The NAC, chaired by Dr. Ed Benz, President of the Dana Farber Cancer Institute, includes Dr. Elizabeth Blackburn, Professor of Biochemistry and Biophysics at UCSF; Dr. Tom Boat, Chair of Pediatrics, Cincinnati Children's Hospital; Mariann Byerwalter, University Trustee; Dr. Ying-Ying Goh, University Trustee; Dr. Dan Lowenstein, Professor of Neurology, UCSF; Dr. Jim Madara, Vice President and Dean, University of Chicago School of Medicine; Dr. William Peck, former Vice Chancellor and Dean, Washington University; Dr. David Satcher, President of Morehouse College; and Dr. Bill Stead, Associate Vice Chancellor

for Health Affairs & Chief Information Officer, Vanderbilt University Medical Center. The past three reviews by the NAC have been quite laudatory – which is, of course, reassuring.

This year's meeting focused on our burgeoning efforts in clinical and translational research and the roles of the institutes, departments and centers. It included presentations by Dr. Harry Greenberg, Senior Associate Dean of Research and Joseph D. Grant Professor of Medicine, on the scope of our activities in preparation for the Clinical and Translational Science Award (CTSA) and by Dr. Bev Mitchell, Deputy Director and George E. Becker Professor of Medicine, on the status of the Stanford Comprehensive Cancer Center. Both presentations gave evidence of efforts now underway at Stanford to enhance translational research by interdisciplinary efforts that cut across basic and clinical science departments as well as various schools at Stanford. We are hoping to hear any day now about the final status of our application to become an NCI-designated cancer center, and we expect to learn the reviews of our CTSA application in May or June. It is clear, however, that these two efforts have played a major role in furthering our mission in clinical and translational research.

During a working lunch, Dr Hannah Valentine, Senior Associate Dean for Diversity and Leadership and Professor of Medicine, gave an update on current programs and efforts to enhance diversity in the School of Medicine and to train future leaders. In doing so she was joined by some of the recent graduates of the Faculty Fellows Program, each of whom shared their views and evaluation of the program and commented on how the program influenced their own career development. The Fellows who participated were Drs. Myriam Curet, Professor of Surgery; Ricardo Dolmetsch, Assistant Professor of Neurobiology; Tracy George, Assistant Professor of Pathology; Sabine Girod, Assistant Professor of Surgery; Tony Oro, Associate Professor of Dermatology, and Eric Sibley, Associate Professor of Pediatrics. They all underscored how much they had learned during the year-long program through their interactions with each other and their mentors, as well as through presentations by leaders about the "leadership journey." Perhaps most importantly, they each commented on how the experience had enabled them to feel more a part of the school and its mission. It also gave them a greater appreciation for the value of a diverse community that could more effectively share ideas and experiences and, based on that, address questions they might have otherwise been overlooked. This session was quite interactive and it seemed to be very well appreciated by the members of the National Advisory Council.

The next panel featured some of our new department chairs, each of whom addressed some of the challenges and opportunities they face in their individual department and how they are seeking to engage in interactions with the Stanford Institutes of Medicine as well as other programs in the School and University. The new department chairs who participated in this panel were Drs. Jonathan Berek, Professor and Chair of Obstetrics & Gynecology; Dr. Ralph Horwitz, Professor and Chair of Medicine; Dr. Karla Kirkegaard, Professor and Chair of Microbiology & Immunology; Dr. Frank Longo, George E. and Lucy Becker Professor and Chair of Neurology; and Dr. Roel Nusse, Professor and Chair of Developmental Biology.

I gave a presentation on our master facility plan based on the scope of the workforce projections we have carried out during the past year and the funding plan that has been developed. I shared the bold and ambitious plan that we have put together, which includes the School, the Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. While this plan continues to evolve and develop, a reasonably complete portrait of it was presented in the December 4 2006 issue of the Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/12_04_06.html).

At the close of the day the committee shared their observations, views and recommendations with President Hennessy. I expect to receive a written report in the next several weeks and will share the outcome with you – although I expect it will be quite supportive and complimentary.

Stanford Institutes of Medicine Hold Successful Retreats

The Stanford Comprehensive Cancer Center

On Monday, March 12th Members of the Stanford Cancer Center gathered at the Quadrus Conference Center for the first annual Members Retreat. The symposium featured a keynote address by Dr. David Livingston, the Chief of the Division of Human Cancer Genetics at the Dana-Farber/Harvard Cancer Center, where he is also the Emil Frei Professor of Medicine and Genetics at Harvard Medical School. Dr. Livingston reviewed the focus and planning activities that led to the development of the Dana Farber/Harvard Cancer Center including how it is currently organized and how it helps coordinate basic research, clinical research and population sciences. The 933 members of the Center are distributed throughout the medical school as well as the five major teaching hospitals. The Center is employing a matrix model that aligns discipline-based faculty with disease-based groups. The Center also provides a number of cores that provide both service and opportunities for innovation. According to Dr. Livingston, since its inauguration, the Dana Farber/Harvard Cancer has stimulated new clinical trials and permitted better management over the progress of clinical trials. It has also served as a magnet for investigators and students to engage in new collaborations and opportunities.

Speaking about the new Stanford Comprehensive Cancer Center, Dr. Bev Mitchell, Deputy Director and the George E. Becker Professor of Medicine, noted that we should be receiving news within weeks about our application for NCI designation based on the excellent proposal submitted in February 2006, which included very strong basic science along with excellent clinical and population science. Dr. Mitchell noted that across the University there are now 270 Cancer Center members who have major areas of focus including cancer stem cells, imaging, immunology, genomics, cancer biology and clinical programs in lymphoma and bone marrow transplantation. But Dr. Mitchell also noted that we have a need to develop more robust solid tumor programs. She cited in particular a center for breast cancer – that could be part of a Women's Cancer Center – as well as one for GI malignancies, prostate cancer, head & neck tumors and brain cancer. She also commented that we have work to do to further build our efforts in cancer genetics, novel therapeutics and preventive strategies and to further build the infrastructure to support a

clinical trials system. Importantly, this will require a number of strategic recruitments that will cut across departments – a number of which are now underway. Similarly, evaluation and support for shared resources will be critical as well as the further enhancement of population sciences and improved alliance with the Northern California Cancer Center.

The retreat also focused on mechanisms to promote translational research and on career development, particularly of younger faculty members – including ways of facilitating collaborations among disease based investigators with those engaged in population sciences. Breakout sessions dealt with population sciences and genomics, cancer imaging, cancer stem cells, improving clinical trials and shared resources.

I was able to attend the morning session of the Retreat, and what was most striking to me was the spirit of collaboration and interest among the attendees. I well remember the tentativeness that existed when the question of forming a comprehensive cancer center was posed some five years ago. Now there is no question – and the Stanford Comprehensive Center is poised to be an essential asset in our basic as well as clinical efforts in cancer research and care. Special thanks go to the leaders who brought this to fruition, particularly Drs. Karl Blume, Steve Leibel, Bev Mitchell and Irv Weissman. But thanks also to the faculty whose tremendous interest has emerged during the past few years and who will clearly propel Stanford in excellence in the years ahead.

The Stanford Institute of Immunity, Transplantation and Infection

The Stanford Institute of Immunity, Transplantation and Infection (ITI) held its first Retreat on March 11-12th, with over sixty faculty who joined in a very lively series of research presentations and discussions. Dr. Mark Davis, Burt and Marion Avery Professor in Immunology and Director of ITI, provided this update of the Retreat. Per Mark, the presentations “were notable for both their range and quality, as cutting edge clinical trials were juxtaposed with novel basic research, and all had to strain at times to assimilate talks on unfamiliar areas. It was an intense day and a half of almost non-stop presentations, and much was learned (and discussed) by all. There were presentations on the different ways pathogens such as the Hepatitis C virus subvert host defenses, how 90% of the cells in the human body have resident microbes, and also about a new gene expression 'signature' of transplant tolerance.

“The session chaired by Dr. Sam Strober was particularly relevant to what the Stanford Institutes of Medicine seek to foster. In his introduction he chronicled many years of work in a mouse model showing how radiation aimed specifically at the lymphoid organs could allow mismatched organ or tissue transplants to be tolerated by the host and vice versa. This has been very successful in curtailing often-fatal graft-versus-host reactions in bone marrow transplant patients and was developed to the point where it was ready to try with organ transplants. This led to a presentation by Dr. Stephan Busque, who described the first three preliminary trials of this approach with kidney transplantation. While the early results were negative, and the patients had to be returned to immunosuppressive drug regimes, after continuous improvement of the protocol, the third clinical trial appears to offer substantial hope, with at least one of the patients being rejection free for months, without having to take the large number of drugs needed to suppress organ

rejection. This is exactly the kind of close partnership between basic scientists and clinicians that we need to solve some of the very toughest medical problems.

“Another important “first” at the meeting was the presentation of Stanford's new Human Immune Monitoring Center. Under the direction of Dr. David Hirschberg, this unique facility has just gotten started and will provide "one stop shopping" for the analysis of clinical samples for a wide variety of immune markers and signs of infectious disease. It will allow a great deal more data to be obtained from a clinical sample (in this case blood) and thus a much better understanding of a particular patients' immune status and prognosis. All members of ITI and the Stanford community are invited to use the HIMC, and it is expected to have broad applicability. It is also hoped that surveying across both healthy people and those suffering from specific diseases will help us to derive specific "metrics" of immune health that could inform medical decision making in much the same way that blood cholesterol analysis informs decisions or advice pertaining to cardiovascular health. There were also excellent presentations on autoimmunity, bioinformatics, liver assist devices and liver cell engineering.

“In the evening we heard talks from June Lang, the senior development officer for ITI, about fundraising, and a particularly rousing talk by Dr. Paul Utz about the very innovative and successful high school summer program that each year brings twenty of some of the most talented high school students in the country to receive basic lab training and then work directly in one of the Stanford research labs. While they currently go to immunology labs for the most part, this program could easily be expanded throughout ITI and even to the other Institutes.

“In the short session Monday morning we learned about venomous snakes as pathogens, the use of 2D NMR to determine a crucial mechanism in the way a virus takes over a cell. We also saw how mutagenesis of a cell death promoting protein turned it into an inhibitor of cell death and thus a possible "drug" that can be used to help prevent graft rejection. The sessions ended with an excellent presentation by Dr. Man Wah Tan, detailing the many pathways in the nematode "C. elegans" that were important to combating infectious diseases, including some that were only thought to involve nervous system function previously. Mark Davis closed the meeting by thanking the organizers-including Michele King, ITI's Program manager, who made all the arrangements and made sure the meeting was going smoothly, and also Larry Steinman, Karla Kirkegaard, Carlos Esquivel, Sam Strober and Garry Fathman for organizing their sessions so well.”

Mid-year Fundraising Progress - Update from the Office of Medical Development

I have received this very encouraging news from Doug Stewart, Associate Vice President for Medical Development and Alumni Affairs. For the first six months of FY2007 we are ahead of all 12 months of the previous FY, both in cash and in new pledges. Specifically, for the six months that ended on February 28, 2007, combined School of Medicine and Stanford Hospital **new activity** (new gifts and new pledges) totaled **\$173,099,203** - compared with \$53,694,709 for the same six months the previous year - and compared with a total of \$156,034,737 for all 12 months of last fiscal year (our previous record).

Moreover, for the six months that ended on February 28, 2007, combined School of Medicine and Stanford Hospital **cash received** (outright gifts and pledge payments) totaled **\$126,331,149** - compared with \$50,285,399 for the same six months the previous year - and compared with a total of \$115,271,429 for all 12 months of last fiscal year.

This is excellent progress, and it is a wonderful testament to the efforts of our entire Office of Medical Development and to the commitment and generosity of those who have given in support of the goals and bold vision of the Stanford School of Medicine and the Stanford Hospital and Clinics. Thank you.

Kidney Transplant Program Excels

The Scientific Registry of Transplant Recipients lists the Stanford Renal Transplant Team as the national leader in one and three year survival rates. This service continues to do a wonderful job and they deserve our thanks and admiration. Special thanks to the team leaders Stephan Busque (Surgery) and John Scandling (Medicine).

Executive Committee Approves By-Law Revisions for the Medical School Faculty Senate

In a recent Dean's Newsletter, (http://deansnewsletter.stanford.edu/archive/02_26_07.html#5), I told you about the major revisions that had been drafted to the By-Laws of the School of Medicine Faculty Senate. I let you know at that time that these extensive revisions had been approved by the Senate and were on their way to the School's Executive Committee. I am now pleased to report that, at the March 16th Executive Committee meeting, the revisions were passed unanimously by that body. The next step will be an email ballot process of the entire electorate, which consists of all members of the Academic Council, the Medical Center Line, and the Clinician Educator Line. Members of these groups should expect to receive their ballots in the near future. Once this step has been accomplished, the revised By-Laws will be submitted to President Hennessy and then to the University's Board of Trustees, where they, hopefully, will receive final approval. I look forward to their implementation, which I believe will result in a significant improvement in the clarity of the governance of the School of Medicine.

STRIDE Takes Another Step

The STRIDE (Stanford Translational Research Integrated Database Environment) initiative is a multi-year informatics research and development project led by Dr Henry Lowe, Senior Associate Dean for Information Resources and Technology, to support clinical and translational research at Stanford by creating an integrated, standards-based clinical data warehouse and research data management platform. The project is based in the Center for Clinical Informatics within the School of Medicine's Office of Information Resources and Technology (IRT). The STRIDE team works closely with both Lucile Packard Children's Hospital and Stanford Hospital and Clinics to establish electronic data feeds from hospital clinical systems into the STRIDE clinical data warehouse. As of March 2007, STRIDE contains clinical information on over three quarters of a million pediatric and adult patients cared for at Stanford. STRIDE is a highly secure environment

utilizing encryption, fine-grained access control and robust auditing. Access to STRIDE clinical data for research purposes requires Stanford IRB review and approval.

To assist Stanford faculty researchers in identifying patients who may be eligible to participate in clinical research studies, the STRIDE team has developed the Anonymous Patient Cohort Discovery Tool. This cross-platform application will allow Stanford School of Medicine faculty researchers to directly query STRIDE's clinical data warehouse of over 73 million clinical observations, to ask the question "might a cohort of Stanford University Medical Center patients with these characteristics exist in the STRIDE clinical data warehouse?" The tool does not expose any individual patient identifiers or clinical data but rather uses criteria such as demographics, diagnosis, procedures performed, clinical reports and laboratory test results to determine the existence, and the approximate size of, anonymous patient cohorts. The system uses statistical techniques to prevent identification of individual patients. This patient cohort discovery process would normally be preparatory to HIPAA-compliant chart review and IRB-approved clinical data extraction or patient contact for research purposes. A beta-test of the STRIDE Anonymous Patient Cohort Discovery Tool will commence in mid-April. Eligible Stanford School of Medicine faculty will be contacted in early April to invite their participation in this evaluation.

Additional information on the STRIDE project and the STRIDE Anonymous Patient Cohort Discovery Tool beta-test is available at <http://clinicalinformatics.stanford.edu/STRIDE/>

Announcements from the Office of Diversity and Leadership

I was pleased to receive the following announcements from Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, and Claudia Morgan, Associate Director.

First, the *2007 School of Medicine Faculty Fellows* have been selected. The Fellows meet regularly to learn from experienced leaders and to receive mentoring and guidance about leadership, both individually and collectively. The program represents an important component of our leadership enhancement efforts throughout the School and Medical Center (see: http://deansnewsletter.stanford.edu/archive/11_28_05.html#2).

A review committee consisting of Drs. Marcia Stefanick, Marlene Rabinovitch, Craig Albanese, Ray Gaeta, Fernando Mendoza, Hannah Valantine, Alice Whittemore, and Julie Moseley selected fourteen fellows from a large pool of nominations.

We congratulate the following Faculty Fellows: Drs. Manuel Amieva (Pediatrics, Microbiology & Immunology), Maxwell Boakye (Neurosurgery), Stephan Busque (Surgery), LaVera Crawley (Pediatrics), Mark Genovese (Medicine), Garry Gold (Radiology), Cheryl Gore-Felton (Psychiatry & Behavioral Sciences), Amreen Husain (OB/GYN), Sheri Krams (Surgery), Michael McConnell (Medicine), Sylvia Plevritis (Radiology), Phil Tsao (Medicine), Ann Weinacker (Medicine), and Sherry Wren

(Surgery). We thank the nominators for their efforts in submitting the many worthy candidates.

Second, the winners of the *2007 Diversity Faculty Fellowship Awards* have been chosen. This program, modeled after the Center of Excellence Faculty Fellowship Program, is directed at enhancing the diversity (broadly defined) of the faculty of the School of Medicine by supporting the development of assistant professors who contribute to such diversity. The intent of the fellowship is to enhance the research productivity of junior faculty in order to advance their progress towards promotion. Congratulations to the following six awardees: Uma Sundram MD, PhD (Pathology, Dermatology), Jennifer Cochran PhD (Bioengineering), Lauren Gerson MD, MSc (Medicine), Joseph Liao MD (Urology), Manuel Amieva MD, PhD (Pediatrics, Microbiology & Immunology), and Tirin Moore PhD (Neurobiology). Congratulations to all!

Bicycle Parking and Safety

As many of you now know, we will soon be starting construction work in anticipation of the building of the Learning and Knowledge Center and the Stanford Institutes of Medicine 1. Much of this work will involve re-routing and updating utilities, creating an underground tunnel delivery system and moving the loading dock on the south side of the medical school campus. To do this work most of the parking spaces in the ground lots south of the Beckman Center and CCSR will disappear. Importantly, once this happens those spaces will not return and alternate parking will be in the Stock Farm garage and parking lots.

With the reduction in parking, many faculty, students and staff have begun using bicycles for transportation (which is great news) and a number of you have asked what type of bike parking and safety will be available. According to our facilities team, a number of actions are underway:

- Last year all the bike racks were replaced with 30 “lighting bolt racks” along the south side of the Edwards building as well as the Lane and Always buildings. This provided 150 bike spaces of which approximately 80 were incremental.
- Over the course of this year another 28 racks of varying lengths will be added providing 150 incremental bike spaces. This project will be completed by the end of March and the new racks will be located along MSLS, Edwards (west side), Beckman, Psychiatry building and along Governor’s Lane. Among the advantages of these new racks is their ability to provide a 3-point contact with a bike thus enabling the locking of the front tire and frame using a “U” lock.
- In addition arrangements are being made to have Security Services increase their presence and surveillance – to offer improved bike safety.
- However, we are not planning to replace the bike racks between the Fairchild Science Building and Auditorium since this area will become a construction site once the LKC project begins.

- That said, when the LKC project moves forward additional bike parking will be provided in that area.
- In addition, bike lockers will be placed on the south side of the CCSR. Each locker is expected to hold two bikes and it is currently planned to install about 10 bike lockers in that area – assignment of which will be managed by the Parking and Transportation Service.

I hope this addresses some of the questions that have been raised. That said, I would be remiss in not reminding all bike riders to be sure that they are wearing a bike helmet and that they have front and rear lights when they are riding at night. Bike safety on campus remains appalling and I continue to strongly encourage all riders to ride with safety.

Announcement: Women in Biosciences

On Tuesday, May 1st Stanford will celebrate Women in the Biosciences with a symposium in the Clark Center from 2-5 PM. Among the featured speakers are: Julie Theriot (Biochemistry and Microbiology & Immunology), Judith Frydman (Biological Sciences), Daria Mochly-Rosen (Chemical and Systems Biology), Anne Villeneuve (Developmental Biology), Michele Calos (Genetics), Merritt Maduke (Molecular & Cellular Physiology) and Jennifer Raymond (Neurobiology).

Awards and Honors

- **Dr. David Cornfield**, Professor of Pediatrics, has been elected Vice President (with succession to President in 2009) of the Society for Pediatric Research. Congratulations, Dr. Cornfield.
- **Dr. Sharon A. Hunt**, Professor of Cardiovascular Medicine, has been selected by the American Society of Transplantation to receive the Senior Achievement award in Clinical Transplantation of 2007.

Appointments and Promotions

- **Ranjana H. Advani** has been promoted Associate Professor of Medicine (Oncology), effective 3/01/07.
- **Meenakshi Aggarwal** has been appointed to Clinical Assistant Professor (Affiliated) (Medicine, Division of Cardiology), effective 4/01/07.
- **James Andrus** has been appointed to Clinical Associate Professor (Pediatrics, Division of Critical Care), effective 2/01/07.
- **Michael Bellino** has been appointed to Clinical Associate Professor (Orthopaedic Surgery), effective 4/01/07.

- **William E. Berquist** has been promoted to Professor of Pediatrics (Gastroenterology) at the Lucile Salter Packard Children's Hospital, effective 3/01/07.
- **Thor Besier** has been appointed to Assistant Professor of Orthopaedic Surgery, effective 3/01/07.
- **Jed E. Black** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences, effective 3/01/07.
- **Zev Bryant** has been appointed to Assistant Professor of Bioengineering, effective 3/01/07.
- **Brendan Carvalho** has been reappointed to Assistant Professor of Anesthesia, effective 3/01/07.
- **Glenn Cockerham** has been appointed to Clinical Associate Professor (Pathology), effective 3/01/07.
- **Alvara Davila** has been promoted to Associate Professor (Affiliated) (Medicine, Division of Gastro), effective 2/16/07.
- **Linda Foppiano** has been appointed to Clinical Associate Professor (Anesthesia, Division of Cardiac), effective 3/19/07.
- **Jeffrey Glenn** has been reappointed to Assistant Professor of Medicine (Gastroenterology and Hepatology), effective 9/01/07.
- **Joachim F. Hallmeyer** has been appointed to Assistant Professor of Bioengineering, effective 3/01/07.
- **Marc L. Melcher** has been appointed to Assistant Professor of Surgery, effective 3/01/07.
- **Harlan Pinto** has been reappointed to Associate Professor of Medicine (Oncology) and, by courtesy, of Otolaryngology - Head and Neck Surgery at the Veterans Affairs Palo Alto Health Care System, effective 3/01/07.
- **Klaus Porzig** has been appointed to Clinical Professor (Medicine, Division of Oncology), effective 3/01/07.
- **Shalini Pereira** has been appointed to Clinical Assistant Professor (Pathology), effective 4/01/07.
- **Dharshi Sivakumar** has been promoted to Clinical Assistant Professor (Pediatrics, Division of Neonatal & Developmental Medicine), effective 4/01/07.

- **Laura Varich** has been promoted to Clinical Associate Professor (Radiology), effective 4/01/07.
- **Po Wang** has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 3/01/07.
- **Claire Wislon** has been appointed to Clinical Associate Professor (Pediatrics, Division of Gastroenterology), effective 7/01/07.
- **Wendy Wong** has been promoted to Assistant Professor (Pediatrics, Division of Hematology/Oncology), effective 9/01/07.

Dean's Newsletter

April 9, 2007

Tobacco, Human Health and Academic Freedom

Earlier this year Dr. Rob Jackler, Edward C. and Amy H. Sewall Professor and Chair of Head & Neck Surgery/Otolaryngology, along with wife, Laurie, presented an exhibit on the role of doctors in helping to market smoking during the 20th Century (see http://med.stanford.edu/about_photo/archive/02_07_07.html). The story is a disturbing one, especially when coupled with the long-standing tactics of the tobacco industry to promote smoking despite its clear association with human disease – a pattern that continues today in developing nations and that targets teenagers and women, especially in socio-economically challenged communities. In 2006, Judge Gladys Kessler, in her landmark decision on behalf of the Department of Justice (*USA v. Philip Morris et al.*), described the tobacco industry (her word was enterprise) as an “intricate, interlocking, and overlapping web of national and international organizations, committees, affiliations, conferences, research laboratories, funding mechanisms, and repositories for smoking and health information which Defendants (the tobacco industry) established, staffed and funded ... to accomplish the following goals: counter the growing scientific evidence that smoking causes cancer and other illnesses, avoid liability verdicts in the growing number of (“plaintiffs”) personal injury lawsuits against the (tobacco industry), and ensure the economic viability of the industry.”

Based on its distortion of public information, manipulation of nicotine in cigarettes to create and sustain addiction, false marketing, youth marketing, and serious efforts to discredit the impact of passive smoking, among other activities, Judge Kessler concluded that the tobacco industry violated the civil provisions of the Racketeer Influenced and Corrupt Organizations Act (RICO) by engaging in a conspiracy to defraud the public by producing and marketing dangerous and addictive products and by misleading the public about the risks associated with these products.

It is doubtful that anyone associated with academic medicine would support smoking given its broad and deleterious impacts on human health. But a derivative question is

whether institutions like Stanford should accept money for research or permit individual faculty to accept money for other activities (e.g., consulting) from the tobacco industry or their foundations (e.g., the Philip Morris External Research Program (PMERP). Several schools of medicine or public health (including Harvard and Johns Hopkins) have policies that prohibit the acceptance of funding from the tobacco industry for research or other purposes. Such a policy does not presently exist at Stanford. However, in February 2007, Robert Proctor, Professor of History, with co-sponsorship by Dr. Hank Greely, Deane F. and Kate Edelman Johnson Professor of Law, and Dr. Rob Jackler introduced a resolution through the University Faculty Senate process recommending prohibition of accepting research funding from the tobacco industry. The proposed resolution is currently under consideration. If such a resolution were to pass, Stanford University would be the first private university in the nation to embrace such a policy for the entire institution. Of interest, the Regents of the University of California will be considering a similar policy in May.

Because of the importance of this issue, I asked Professors Jackler, Proctor and Greely to make a presentation to the School of Medicine's Executive Committee on Friday April 6th. While I did not intend for the committee to engage in a formal vote I felt it important that this issue be thoroughly discussed and its various implications carefully considered. For reference, following is the original policy, which was enacted by the Stanford University Academic Senate on December 8, 1971. The proposed change is also presented below:

Current Policy of the Academic Senate	Proposed Change
<i>"Individual scholars should be free to select the subject matter of their research, to seek support from any source for their work and form their own findings and conclusions."</i>	<i>"Stanford University will not enter into sponsored research agreements with companies that make or market tobacco products. In addition, Stanford University will not enter into research agreements with entities controlled by such companies, where those entities fund research on tobacco-related diseases, alternative causes of such diseases, or the uses and effects of tobacco, tobacco products, or their components." (The resolution would be reviewed in ten years time.)</i>

The Executive Committee engaged in a vigorous, sometimes intense, but thoughtful discussion and debate about the proposed resolution and the issues. It is important to begin by stating what should be obvious. All of the Committee members present (although I did not do individual polling) seemed clear that they do not support smoking or the tobacco industry; nor did they disagree with the proposition that this industry, likely more than any other, has produced – and continues to produce – products that are seriously detrimental to human health. Further, there was concurrence that the tactics and marketing of the tobacco industry continue their long practice of misinformation and

outreach to vulnerable communities – youth, developing nations and others – for the purpose of selling their products seemingly regardless of its negative impact on health. That said, there was considerable discussion and debate about whether the 1971 policy should be changed with respect to this specific industry or whether the ability of our faculty to seek funding from any source should continue unencumbered by even this single restriction.

At least for research grants (I have no knowledge of consulting arrangements) there has been until recently only one research grant supported by PMERP at Stanford – and this to an outstanding and highly qualified investigator addressing an important problem. This investigator has decided to terminate the grant, such that in the immediate future Stanford would not be receiving any research funding from the tobacco industry. So that makes the issue one of a proposed policy with future implications for Stanford and, by inference, a strong indictment of one industry. One might even argue that the 1971 policy is working, since personal choices by individual faculty have led them away from seeking any research funding from the tobacco industry. Of course, that could change – either because other funding sources (e.g., NIH) become more limited or because a specific faculty member elects to pursue funding from the tobacco industry to support a specific research question. In contrast, the lack of a definitive policy misses the opportunity to make a specific statement about the tobacco industry *per se* – which might be seen as either a moral or a data-driven stand.

At the same time, and as was discussed vigorously at the Executive Committee and, I gather, in other venues, there is concern about the “slippery slope.” That is, should there be a line beyond which an institution like Stanford should prohibit the acceptance of funding from specific sources based on their nature and/or activities? While there is good evidence that the tobacco industry has crossed that line, it is not the only one associated with products that negatively impact health. With the rising incidence of obesity and its myriad of complications throughout life, should we similarly prohibit funding for research from the McDonald Foundation or others associated with fast foods – or even certain kinds of food? What about industries that are damaging the environment, such as the oil industry? With all the evidence on global warming, have they crossed the line? And what about the pharmaceutical industry, which has made decisions to leave drugs on the market when they have known about complications – should we ban them as well? And you can raise others I am sure.

The nuances and the complexity - as well as the simplicity - of the arguments provoke debate such as the one that took place at our Executive Committee. None of the debate indicates a lack of abhorrence of tobacco and the damage done by the industry that produces and markets tobacco products. Rather it is about whether specific policies should be generated for specific funding sources and if so, how such policies will be monitored and managed in future years as new data emerges. And, of course, there is the question of whether such policies encroach on the academic freedom of our faculty – another issue that generates many different perspectives.

I respect the range of opinions that have been offered and the spirit in which they have been presented. I have an opinion as well. To me it seems clear that the tobacco industry has crossed a line in a manner different from other funding sources. Not only have they crossed that line but they continue to do so, and the current marketing tactics of this industry are seriously disturbing. While I trust informed faculty to make individual decisions that are morally sound, I also believe that there are moments when it is time to send a clear message to a specific industry – in this case the tobacco industry. Thus, I personally support the spirit of the proposal to prohibit Stanford's acceptance of tobacco money for research. However, I would want such a prohibition tied to any money coming to faculty for consulting as well as research. That is, just as Stanford divested its investments in the tobacco industry nearly a decade ago, I believe that faculty should not receive money from the tobacco industry for consulting or research.

I am interested in your opinions as well. Please share any points of view that you have about this significant issue.

Director of NIH Visits with Stanford Academic and Industry Leaders

On Monday April 2nd we hosted Dr. Elias Zerhouni, Director of the NIH, for two important events. The first was an informal dialogue with our School of Medicine Executive Committee, and the second was a meeting Stanford co-hosted with UCSF and UC Berkeley that included, by invitation, CEOs from biotech, venture capitalists, and University trustees, among others. Both meetings underscored the importance of the NIH to biomedical research and to the unique role it plays in fostering a climate of innovation and discovery like the one that exists at Stanford. A goal of the discussion was to draw a closer alignment between the NIH and industry to enhance and support innovation – a message that needs to be conveyed to the US Congress, especially in light of the flat to declining budgets the NIH has experienced in the past 3-4 years. Indeed, as Dr. Zerhouni knows and certainly heard from faculty during his visit, the competition for funding has become extremely serious during the past 2-3 years. It is exacting a toll on accomplished scientists, thus negatively impacting the foundations of academic medical centers, and if not ameliorated, risks damaging the nation's investment in biomedical research.

While the doubling of the NIH budget from 1998-2003 created an air of excitement – leading many more individuals to apply (and succeed) in receiving NIH funding - and while it led many institutions (albeit not Stanford) to engage in capital investments to create space for more NIH investigators, the past 3-4 years has seen the pendulum swing in the opposite direction. There are a number of reasons why NIH funding has been held flat to declining since the doubling. Key among these is the loss of the bi-partisan congressional support that the NIH experienced in past years. This has been due to such factors as: the belief that NIH “had its day” and other agencies should now be supported; the sense that NIH failed to deliver great discoveries or impact human disease despite the doubling; scandals around conflict of interest at the NIH that raised serious concerns about the integrity of the once highly respected agency; and an anti-science mood that began permeating the congress – and the nation – in ways that had not existed a decade ago. Moreover, discretionary dollars were being depleted due to the war in Iraq and

elsewhere, making funding options more limited. In addition, political agendas began shaping NIH funding – from the NIH reauthorization to challenges to the peer review system and beyond. I have previously written about a number of these issues in past Newsletters (see: http://deansnewsletter.stanford.edu/archive/12_18_06.html#1d) and have also been working to address them on a national level.

In his discussions with community leaders, Dr. Zerhouni opined on the changing public health challenges, including the shift from acute to chronic disease conditions, the aging population, the health disparities that exist in the USA (made worse by the lack of a true healthcare system), emerging and re-emerging infectious diseases and emerging non-communicable diseases. He noted that we need to transform the health care system to intervene before symptoms appear and thus preserve normal function for as long as possible. Further, we need to benefit from the increased understanding and recognition of various preclinical molecular events in order to detect patients at risk for disease at much earlier stages. This means moving medicine from curative to preemptive by making it more predictive, personalized and participatory.

From his perspective as Director of the world's most significant biomedical research institute he also noted that NIH needs a balanced portfolio – including sustenance of its historical and current support for basic fundamental research (around 65% of the budget) coupled with an investment in translational and clinical research. He pointed out that the discoveries that have taken place in the past decades through basic and translational research have markedly improved disease outcomes at a cost far less than what we pay for health care per se. For example, the average investment in cardiovascular research is about \$3.70 per American per year (or a total of \$110 per American over the past 30 years). Similarly the average expenditure on cancer per American during the past 30 years has been about \$260 – with an impact that has been far-reaching in terms of insights into the fundamentals of cancer biology and increasingly to cancer treatment. Plus, as a consequence of NIH investments in biomedical research and academic medical centers, more than 3100 new technologies have been brought to market in the past six years, and since 1980 more than 4500 new companies have been formed because of new technologies developed at US institutions. So the impact of biomedical research has been far-reaching and highly significant – but it cannot be sustained without continued investments and support.

California has led the nation in NIH funding (followed by Massachusetts, Maryland and Pennsylvania) and the support to institutions like Stanford, UC-Berkeley, and UCSF has increased significantly during the NIH doubling period. At the same time, the number of applicants for NIH funding nationwide also increased from 24,154 in 1998 to 51,007 in 2007. While the success rate held at approximately 31% during the period of doubling, it has declined to 19% and falling since the budget has declined. Both the increased number of applicants (a good thing) and the lower budget compared to inflation (a bad thing) have contributed to the current sense of crisis. Despite this, Dr. Zerhouni wanted to make clear that cycles in NIH funding have occurred in the past but that the recovery from depressions required a clear message of why support is needed– which he believes has not been fully articulated to date. He also emphasized repeatedly that the NIH has not

decreased its support for basic research – and that the investment has grown in nominal dollars. Further, he underscored that initiatives like the NIH Roadmap have consumed only a small portion of the NIH budget (about 1.1% to date) and thus are not the source of the funding crisis. Rather this is attributable to more applicants and fewer dollars.

Among his major concerns is preserving the next generation of biomedical research scientists during a time of funding downturn. Accordingly, the NIH has recently introduced the “New Investigator’s Program.” As part of this Program the NIH instituted the Pathway to Independence Award. California received 24 of the 58 the new awards that were announced in November 2006, and Stanford faculty accounted for 8 – the highest of any institution. To foster creativity, the NIH Director’s Pioneer Awards were introduced three years ago and to date 34 have been given – seven of which have been to Stanford faculty – again the highest in the nation. In addition a new program – the NIH Innovator Award - has been just announced to support new investigators who do not yet have an R01 grant and who propose projects that have the potential for great impact on biomedical or behavioral sciences. The NIH anticipates making at least 14 of these awards in September 2007.

Dr. Zerhouni made it clear that he and his colleagues at NIH are quite aware that these are tough times. His goals are to increase the number of competing research project grants and to strengthen support for at-risk investigators – including new investigators, those with first grant renewals and well-established investigators with little or no additional support. Importantly he noted that among the greatest mistakes that could be made would be to stop taking risks.

Because the NIH Director cannot lobby the Congress for increased support for the NIH, it is incumbent on each of us to make the case. That is why we have joined forces with industry leaders in California to make the case for why investment in the NIH is critical to our nation’s future. I participated in a highly successful visit to Congress with CEO leaders from the California Healthcare Institute on January 18th and will join Dr. Zerhouni in a panel discussion to a bipartisan congressional delegation on April 25th. In addition, Ryan Adesnik, in conjunction with government affairs representatives from peer institutions, has arranged for the 2006 Nobel Laureates (which of course will include Andy Fire and Roger Kornberg from Stanford) to share their support for the NIH with Members of Congress.

While the NIH funding remains a major challenge, there do appear to be some positive indicators that our messages are getting some traction. But much remains to be done and I encourage all members of our community to be advocates through their professional societies – or to contact me or Ryan Adesnik (ryan.adesnik@stanford.edu) if you have any suggestions or recommendations about how we can do more to advance this important cause.

An Important Perspective on the VA

Lisa Freeman, Director of the VA Palo Alto Health Care System (VAPAHCS) and Larry Leung, Maureen Lyles D'Ambrogio Professor and Chief of Staff at VAPAHCS, have experienced first hand the impact of the disclosures about medical care at military hospitals such as Walter Reed Army Medical Center and, in a more general way, the VA Department of Defense military medical facilities. While many of the disclosures have been highly disturbing, we all recognize that not infrequently such dialogues can cast a mantle of blame that can be indiscriminate. Accordingly, I spoke with Ms Freeman and Dr. Leung and asked them to offer some perspective from their leadership roles at the VAPAHCS. Because of the important collaborations and interactions between Stanford and the VAPAHCS, we wanted to share some observations, facts and perceptions.

For decades, the Stanford University School of Medicine and VA Palo Alto Health Care System (VAPAHCS) have had one of the finest academic and clinical affiliations in the nation. VAPAHCS staff train over 1,300 residents, interns, and students each year. VAPAHCS has 80 affiliation agreements to train health care professionals in various disciplines. In addition to the physician training programs (anesthesiology, medicine, surgery, psychiatry, etc.) they have trainees in audiology, blind rehabilitation, chaplain, dental, nursing, research, social work and other disciplines.

VAPAHCS is a major referral center for other VA facilities, the Department of Defense and private health care providers. It is renowned for its state-of-the-art diagnostic, medical, surgical and specialty care. Additionally, it is home for the National Center for Post Traumatic Stress Disorder (PTSD) and one of four VA Polytrauma Centers in the nation, providing specialized care for military service members who sustained multiple and severe injuries in combat in Iraq and Afghanistan.

Because we do have such a close relationship between Stanford and the VAPAHCS, we wanted to share some facts about the health care system:

- In FY 2006, VAPAHCS exceeded VA standards regarding clinical practice guidelines in care of patients with cancer, cardiovascular diseases, endocrinology, smoking cessation and long-term care.
- VAPAHCS had the highest patient satisfaction results in both inpatient and outpatient settings of any facility in the Sierra Pacific Network and one of the highest in the entire VA system.
- VAPAHCS was named one of the nation's 100 Most Wired Hospitals for 2006, by Hospitals & Health Networks Magazine. This was the fourth time VAPAHCS was included in this list.
- In March 2007, the Joint Commission conducted an unannounced full five-day survey resulting in a three-year accreditation decision.
- VAPAHCS maintains six "Centers of Excellence" including: Autopsy, Domiciliary Care for Homeless Veterans, HIV/AIDS Services, Spinal Cord Injury, Comprehensive Medical Rehabilitation and Cardiac Surgery.
- In consecutive years, VAPAHCS staff, Dr. James Hallenbeck and Dr. David Gaba, were awarded the Worthen Award for academic excellence, the highest award given by VA in education.

- Also in consecutive years, Dr. Tom Rando and Dr. David Rehlman were selected as recipients of NIH Pioneer awards – comprising two of the seven NIH Pioneer Awards received by Stanford faculty in the past three years – the highest number in the nation.
- VAPAHCS' Research Program is always ranked among the top three programs within the VA system in terms of total research dollars awarded.
- VAPAHCS is among an elite number of VA facilities to host a GRECC (Geriatric Research, Education and Clinical Center), a MIRECC (Mental Illness Research, Education and Clinical Center), a Health Services Research Center of Excellence and a Rehabilitation Research and Development Center.
- Approximately 100 Stanford faculty in the School of Medicine are based at VAPAHCS.

On the national level during 2006, VA received a number of prestigious awards and accolades for high standards of care. VAPAHCS was praised in media segments from Anderson Cooper 360, the Jim Lehrer Newshour, People Magazine, Newsweek, National Geographic and front-page stories in the San Francisco Chronicle and San Jose Mercury News and on all the local television stations.

While we all recognize that the serious problems observed at some military facilities are egregious and require immediate attention, I want to say that such problems are not the case at the VAPAHCS, despite the fact that the news media seems to include all VA facilities in their commentaries. Clearly there are exceptions and I believe that the VAPAHCS is one of those. Indeed, I am proud of the VAPAHCS and the outstanding work being done by faculty and staff. We have many wonderful interactions and I look forward to those increasing in the years ahead. In fact, as I mentioned in my December 4th Newsletter (see: http://deansnewsletter.stanford.edu/archive/12_04_06.html#1g) I fully believe that our partnership will continue to grow productively and successfully in the years ahead.

Certainly Ms. Freeman, Dr. Leung and I recognize that a continued and ongoing focus and commitment to quality and excellence in patient care as well as research and education are essential – and these are goals we share together.

US News & World Reports Again

On Monday April 2nd US News & World Reports (USNWR) posted the ranking of the “top graduate schools” in the USA, including the top research-intensive schools of medicine. You are likely aware from prior communications (see: http://deansnewsletter.stanford.edu/archive/04_03_06.html) that I have been corresponding and meeting with the editors of USNWR for some time to advocate for a change in the methodology they employ – and they did make a change to a degree last year by including the data on NIH funding per faculty member. In looking at the data for this year, where we are once again ranked #7, it is clear that the only thing holding us from a higher rank in this survey is the total amount of NIH funding. We are lower than any other school in the top 10 in total NIH funding - which is really a function of our smaller faculty size compared to peers. Since total NIH funding weighs heavily in the

scoring, we are truly impacted by that category. In contrast, we are highest in NIH funding per faculty member (a better surrogate for quality). However, since this has a lower weight, it is offset by total NIH funding. Accordingly there is a ceiling that we are not able to break through. And while I know that USNWR ranking is not a serious validation or measure of the excellence of research-intensive US medical schools, it is unfortunate that the size of a research intensive school (we are about 40% as large as UCSF and less than 10% the size of Harvard in our fulltime faculty) counts more than its quality in the USNWR data that goes to the public. Left out, of course, is the fact that two of our wonderful faculty won Nobel prizes last year or the fact that we received more NIH pioneer awards than any school in the nation or the fact that our students received more HHMI fellowships than any school or the fact that we are among the lowest schools in the nation in indebtedness at graduation. We have great students, faculty and staff and in my opinion they are #1!

A New Program on Professional Billing Integrity

Ms Diane Meyer, the Chief Compliance and Privacy Officer at Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH), asked me to share some information about the recently launched Program in Professional Billing Integrity. This program is designed to foster continuous performance improvement by promoting accurate documentation and coding through education and auditing. It will include the traditional components of education and retrospective chart audits, as well as emerging indicators designed to identify how well physicians and non-physician providers are meeting regulatory requirements. The new program will be implemented in several stages.

The initial stage is scheduled to begin in April and is designed to address the core requirement for an effective professional fee compliance program stated by the U.S. Department of Health and Human Services, Office of Inspector General (OIG):

"The OIG recommends that a baseline, or 'snapshot,' be used to enable a practice to judge over time its progress in reducing or eliminating potential areas of vulnerability. The OIG recommends that claims for services submitted and paid after the implementation of an education and training program be examined, so as to give the physician practice a benchmark against which to measure future compliance effectiveness."

The first step is baseline education for all physician and non-physician providers. Mandatory educational sessions will be conducted by the Compliance Department during the months of April, May and June. The two-hour educational sessions will be grouped by specialty area and will include documentation and coding information specific to the specialty. In addition to the specialty-specific information, the training will cover Teaching Physician Documentation, Evaluation and Management Services, Modifiers, and, if applicable to the specialty area, Consults, Critical Care and Observation Care.

Each specialty will have several sessions scheduled and each physician and non-physician provider is required to attend one of the mandatory educational sessions for

his/her specialty area. According to Ms Meyer, departmental DFAs will be notifying physicians of the dates and times for the specific sessions scheduled for the specialty and will be issuing instructions for physicians to register for one of the sessions. To accommodate physicians who are rarely on campus or who are on sabbatical, an exception may be granted by contacting the Compliance Department and an alternative means of education will be provided. Please contact your DFA if you have questions about registering for one of the sessions.

To demonstrate an effective compliance program to government agencies, it is important that all physician and non-physician providers who bill for their professional services attend the baseline educational program. According to Ms Meyer, the SHC-LPCH Compliance Department will maintain a verifiable record for each participant in the educational session that includes the content of the documentation and coding training and will make these records available to government investigators should an individual provider fall under government scrutiny. This is important since demonstration of standardized, in-depth training regarding documentation and coding rules generally reduces the impact of government fines and penalties in the event of unfavorable government investigations.

After the educational component is completed, Ms Meyer notes that the next stage will be baseline retrospective audits for all physicians and non-physician providers conducted by the Compliance Department. These audits will be conducted on claims submitted subsequent to the date that the physician attended the baseline educational session. Importantly, **no** pre-education claims will be audited for the baseline retrospective audits. Accordingly, the educational session is an opportunity for physicians and non-physician providers to learn the specific billing rules against which their documentation will be measured during the audits. Audit results will be benchmarked and reviewed by Departmental and Division leadership, School of Medicine leadership, hospital leadership, and the Audit and Compliance Committees of the hospital Board of Directors.

During fiscal year 2008 (which begins on September 1 2007), the Office of the Dean, the Counsel of Chairs Committee, hospital leadership and the Compliance Department will be continuing development of the collaborative Professional Fee Billing Integrity Program. The Compliance Department will be implementing additional risk indicators designed to identify areas of vulnerability in professional fee billing.

If you have any questions about the new program or the mandatory educational sessions, please contact Diane Meyer, Chief Compliance Officer at 724-2572, dmeyer@stanfordmed.org.

Update on The Respectful Workplace Initiative

For the past four years, the School of Medicine's Dean's Office has spearheaded a program designed to improve the nature of faculty and staff interactions in the medical school. The Respectful Workplace Initiative has included the training of all staff and faculty in the policy on Respectful Workplace and in encouraging work units to develop

effective and respectful communications and approaches to conflicts and disputes that naturally occur in any workplace. It has also been designed to foster a sense of entitlement (yes, entitlement) that all should be treated with dignity in all situations regardless of status or power.

There are two components of the Initiative--mandatory Respectful Workplace Briefings and optional lunchtime Respectful Communications programs. This spring and summer, the Human Resources Group (HRG) will continue ongoing mandatory training of new staff in the Respectful Workplace Briefings. HRG and the Office of the Ombudsperson planned a series of five optional lunchtime programs focused on giving members of the medical school community opportunities to enhance their abilities to deal with challenging situations and respectful communications in the workplace.

The first of these optional Respectful Communications programs was held on March 29, 2007 and featured John Cleese (famous for Monty Python and A Fish Called Wanda) via videotape entitled *Meetings Bloody Meetings*. This video was very well received and was an excellent opportunity to learn how to conduct and participate most effectively in meetings. If you have a work group who may benefit from viewing this video, please contact Norma Leavitt, Human Resource Group, at 5-8607 for arrangements.

Additional lunchtime programs are scheduled as follows:

- **April 19, 2007** Rosan Gomperts, Director of the Help Center and David Rasch, University Ombudsperson, will review different types of hostile behaviors, the effects of these behaviors and ways to potentially manage these types of situations. There will also be a brief review of the policies and resources to assist with managing hostility in the workplace. (MSOB, X303)
- **May 23, 2007** Frederic Luskin, Director of the Stanford Forgiveness Project and author of *Forgive for Good*, will talk about the importance of practicing forgiveness and how forgiveness can reduce anger and depression and enhance hopefulness. (Beckman Center, Munzer Auditorium)
- **June 20, 2007** *Straight Talking*, a John Cleese video presenting techniques of assertive behavior to show that the basic rule of assertive behavior is honesty and why aggressive behavior doesn't work in the long run. (MSOB, X303)
- **July (date TBD)** Lee Lyon, Human Resources Director of Stanford Linear Accelerator Center, will present a communications model including our responsibilities for relationships and interactions with others. (Location TBD)

A separate email invitation will be sent to departments for staff and faculty and will include further information on location, time, and registration information. We hope you will plan time in your busy schedule to attend.

More on US Healthcare Reform

At the Annual Meeting of the Association of Academic Health Centers, where I serve as a member of the Board of Directors, the topic of our expensive and in many ways failing health care system was front and center. Among the speakers at a plenary session was Senator Ron Wyden from Oregon, who has proposed the Healthy American's Act. He began his presentation with a statement that also appears on his website"

"Employer-based health coverage is "melting away like a popsicle on the summer sidewalk" and Senator Ron Wyden, a member of the Finance Committee, has offered a groundbreaking proposal that will revolutionize the way Americans get health care. Wyden's Healthy Americans Act will provide affordable, high-quality, private health coverage for every American regardless of where they live or work."

Senator Wyden's Healthy American's Act proposes to "guarantee private health care coverage that cannot be taken away for all Americans; provides benefits for all Americans equal to those of Members of Congress; provides incentives for individuals and insurers to focus on prevention, wellness and disease management; provides tough cost containment and saves \$1.48 trillion over 10 years; and is fully paid for by spending the \$2.2 trillion currently spent on health care in America. He seeks to accomplish this by sustaining private health care insurance (rather than moving to a single payer system) and his proposal does not address entitlement programs like Medicare and Medicaid – which are important since Medicare in particular is on a path to insolvency in the next decade. Nonetheless he does offer a credible plan compared to many of the expedited "quick fix" strategies more aimed at political expediency. Accordingly, if you are interested you might wish to examine the details in more depth since I suspect this will be one of the proposals that will gather momentum during the next couple of years. The url is http://wyden.senate.gov/Healthy_Americans_Act/HAA_How_It_Works.pdf.

Universities Reaching Out

I have recently received information that may be of interest to those of you who might enjoy taking on-line university courses free of charge. Some prominent universities are moving in this direction – including MIT and Princeton. You can now access MIT's Open Courseware site (<http://ocw.mit.edu/index.html>) where some 1800 courses are available for free! In another venue, Princeton President Shirley Tilghman recently announced that many courses will be available at the University Channel's Website <http://uc.princeton.edu/main/>. I wanted to make you aware of these interesting offerings.

Upcoming Events

The Office of Diversity and Leadership would like to invite you to hear **Dr. Carl Cardella, M.D., FRCPC**, speak on **How to be Successful at your First Academic Job** on Tuesday May 8th, at 12 noon, in the Clark Auditorium. Dr. Cardella is Professor of Medicine at the University of Toronto. Since seating is limited, please respond to lydiae@stanford.edu by May 4th. There will be a buffet lunch immediately after the presentation.

Awards and Honors

- **Dr. Harry Greenberg**, Senior Associate Dean for Research and Grant Professor of Medicine has just been voted the President-elect of the American Society of Virology – a great honor bestowed by a community of distinguished scientists.
- Medical student **Jennifer Staple**, the founder and CEO of Unite for Sight, a nonprofit organization that helps the blind and homeless, is receiving a Brick Award, which has been called the “Oscar of Youth Service” for her work. This Award, which is given by the organization Do Something, celebrates young people making our world better place. Jennifer is also the organizer of the upcoming Unite for Sight Conference, which will be held at the School of Medicine on April 14-15. For more information about the conference, see: <http://news-service.stanford.edu/news/2007/february28/med-staple-022807.html>
- **Dr. Joanna Wysocka**, Assistant Professor of Chemical & Systems Biology and Developmental Biology, has been named one of this year’s Searle Scholars. This highly prestigious award supports young scientists who have demonstrated outstanding accomplishment and innovation.

Congratulations to all!

Appointments and Promotions

- **Michael J. Cherry** has been reappointed to Associate Professor (Research) of Genetics, effective 4/01/07.
- **Amarendra Das** has been reappointed to Assistant Professor of Medicine (Stanford Medical Informatics) and of Psychiatry and Behavioral Sciences, effective 5/01/07.
- **Joachim F. Hallmayer** has been appointed to Associate Professor of Psychiatry and Behavioral Sciences, effective 3/01/07.
- **Theo Palmer** has been promoted to Associate Professor of Neurosurgery, effective 4/01/07.
- **Renee Reijo Pera** has been appointed to Professor of Obstetrics and Gynecology, effective 4/01/07.

Dean's Newsletter

April 23, 2007

Dr. Hugh O'Brodovich Is Named New Chair of Pediatrics

I am enormously pleased and excited to announce that Dr. Hugh O'Brodovich has accepted my invitation to serve as the next Chair of Pediatrics at Stanford and Chief of Staff at the Lucile Packard Children's Hospital (LPCH), succeeding Dr. Harvey Cohen who served with distinction in the roles during the past thirteen years. While I must admit that the search for the new chair went on much longer than I anticipated, due largely to some unexpected events and very challenging circumstances, I am most pleased with the outcome and believe that we have identified the most outstanding leader possible to help move Stanford Pediatrics and the LPCH to a new level of excellence.

In making this appointment I would like to thank the diligent work of the Pediatric Chair Search Committee, led by Dr. Tom Krummel, Professor and Chair of the Department of Surgery. That committee identified over 140 possible candidates and interviewed more than 20 excellent pediatric leaders. They worked long hours and helped to enlighten the broad pediatric community about the excellent opportunities available at Stanford. While Dr. O'Brodovich was very highly considered by the Search Committee during the early phase of the search in 2005, he declined to pursue the position for a variety of personal and professional circumstances. Thankfully a number of those issues changed in the intervening 15 months, permitting me to re-engage him in mid-January 2007. Since then we have each learned a tremendous amount about each other, culminating in his acceptance of the offer to serve as Chair on Friday, April 20th. I want to thank in particular Mr. Chris Dawes, President and CEO of LPCH, along with his hospital leaders for the important role they played in the search. I also want to thank the Dean's Office, particularly Marcia Cohen, Julia Tussing, Rebecca Trumbull, Mira Engel and Kendra Baldwin for their diligent work in helping to make this recruitment successful. This took more than a village to achieve successful resolution – indeed it took a University!

Dr. Hugh O'Brodovich, Professor of Paediatrics and Physiology, is uniquely qualified to assume the exciting responsibilities at Stanford and LPCH based on his long and exemplary track record as a leader, researcher, educator, scholar and clinician. He served as Chair of the Department of Paediatrics and Paediatrician-in-Chief at the world-renowned Hospital for Sick Children (HSC) and the University of Toronto from 1996-2006. At these institutions individuals are not permitted to exceed ten years in their leadership position. During his tenure as chair at the University of Toronto and Paediatrician-in-Chief at HSC, Dr. O'Brodovich increased the HSC's full time pediatric faculty from 110 to 175 full time pediatricians (163 FTE) with 45% being recruited from outside of Canada, more than one third being clinician-scientists and researchers and 30% belonging to visible minorities. The University-wide Department of Paediatrics consisted of 341 pediatricians located at four fully affiliated academic health science centers and community sites. He, his executive committee and the faculty developed novel faculty mentorship programs for clinician scientists and clinician teachers that played a significant role in the success of his Career Development and Compensation program.

This novel performance-based pathway for academic departments has been published in the peer-reviewed literature. As published, relevant aspects of this model have been adapted by all Canadian pediatric academic health science centers as part of their career development strategies, organizational structure and physician work-force planning.

Dr. O'Brodovich received his medical degree in 1975 from the University of Manitoba, where he then completed his residency training in Paediatrics and Respiratory Medicine. At that time, one of his senior residents was our own Dr. Charles Prober, Professor of Pediatrics and Senior Associate Dean for Medical Student Education. Dr. O'Brodovich then completed a three-year post-doctoral research fellowship in Pediatric Pulmonology at the College of Physicians and Surgeons of Columbia University. He then spent five years on the faculty at McMaster University, moving to the Hospital for Sick Children in 1986 where he served as senior scientist, Head of the Research Institute's Division of Respiratory Research and Division Chief of Respiratory Medicine prior to becoming chair. Dr. O'Brodovich received the R.S. McLaughlin Foundation Chair in Paediatrics at HSC. Throughout his entire career he has continuously held research grants from the Medical Research Council of Canada, now the Canadian Institutes of Health Research, in addition to other national peer-reviewed funding agencies.

Under his direction, Dr. O'Brodovich built a tremendous leadership team in the Department of Paediatrics that has enabled the development of a number of programs that impact clinical care, research endeavors and educational programs. Some of the many accomplishments include: a fellowship program that started out with three positions in 1996 and which has now grown to an internationally renowned program with over 30 fellows per year; the enhanced presence of pediatrics within the undergraduate medical education program; the establishment of a new Division of Developmental Pediatrics; an expanded postdoctoral program which in 2005 had 219 Department of Pediatrics' subspecialty training fellows from 26 countries training during a single year; an increase in the number of department faculty holding appointments within the Research Institute; an increase in research grant funding; implementation of Career Development and Compensation Program; and integral involvement with the National Coalition for Child and Youth Health. The Hospital for Sick Children is one of the world's best children's hospitals with an international reputation no doubt strengthened by the leadership of Dr. O'Brodovich. The hospital is known for its leadership in scholarly clinical care; basic, clinical and health outcomes research; and the education of medical students, postgraduate and specialty trainees and continuing education participants.

Dr. O'Brodovich was also instrumental in establishing the Medical Research Council's Group in Lung Development and established and was the inaugural head of the HSC's Lung Gene-Based Therapy research program. The impact of his research contributions is reflected by his international reputation in the scientific community as acknowledged through the receipt of the Scientific Achievement Award from the American Thoracic Society, the Polgar Lectureship from the Children's Hospital of Philadelphia, the Kendig Award from the American Academy of Pediatrics/American College of Chest Physicians, and the Fleischner medal, amongst others. He has also been a leader in education; prior to becoming Chair of Paediatrics he was the Chairman of the sub-specialty board for

pediatric pulmonology of the American Academy of Pediatrics and the Vice-Chair for Respiratory Medicine with the Royal College of Physicians and Surgeons of Canada.

An individual of renowned reputation internationally, Dr. O'Brodovich has held numerous positions of leadership, among them the inaugural presidency of the Paediatrics Chairs of Canada and member of the Executive Committee of the American Medical Association of Medical School Pediatric Department Chairs, Inc. Currently President-elect of the Fleischner Society and Fellow of the Canadian Academy of Health Sciences, Dr. O'Brodovich is also an elected member of the American Physiological Society, the Canadian Society for Clinical Investigation, the Society for Pediatric Research, and the American Pediatric Society. His dedication to advocacy of children's health is reflected in his role as one of the founding members of Canada's National Coalition for Child and Youth Health. He is presently on the Advisory Board for the Canada's Institute for Human Development Child and Youth Health, Canada's NICHD.

Despite my personal knowledge of Dr. O'Brodovich during my past role as a pediatric department chair in Boston, I carried out extensive reference checking from leaders in Canada and the USA. A consistent theme emerged of a visionary leader who is highly regarded by basic science and clinical colleagues, who is able to work successfully with hospital and academic leaders, who is able to bring positive change to institutions through his energy, focused determination and commitment to excellence and who is highly recognized as a transformative leader. I would also add that Dr. O'Brodovich was highly recommended by Dr. Tom Boat, a member of the School of Medicine National Advisory Council (and chair of Pediatrics at the Cincinnati Children's Hospital) as well as Dr. Elias Zerhouni, Director of the National Institutes of Health, both of whom felt that recruiting him to Stanford would be a great coup.

At this juncture in the history of Stanford Pediatrics and the Lucile Packard Children's Hospital, I believe that we are ready to move to the next level of excellence and I am confident that Dr. Hugh O'Brodovich has the professional and personal skills and abilities to help us achieve our goals and beyond. Please join me in welcoming Dr Hugh O'Brodovich as our new Chair of Pediatrics at Stanford.

NCI Designation At Last!

On Wednesday, April 18th we received the wonderful news that we could announce our designation by the National Cancer Institute as an NCI Cancer Center (see: <http://mednews.stanford.edu/releases/2007/april/NCI.html>). Depending on one's perspective, this great news took either 5 years or 35 years to come to fruition. Before my arrival in April 2001, Stanford had made at least five other attempts to apply to the NCI for designation as a Cancer Center – none of which actually resulted in a formal application. I placed the issue of becoming an NCI Cancer Center and/or a Ludwig Center before a faculty task force in 2002, and, while there was receptivity to pursuing one or both, there was still a culture of disbelief that we could achieve either. This is not at all to say that Stanford didn't have all the ingredients – a world-class cancer biology program, outstanding clinical investigators and an integrated medical center. It was

simply that the culture of the institution was not really aligned to such cooperative efforts – a criticism that we heard from our first External Advisory Board. But we found our ways to success – now being both an NCI Designated Cancer Center as well as a Ludwig Cancer Center.

The keys to success included engaging faculty leadership and collaboration under a dedicated leader (and, to a degree, taskmaster). This was Dr. Karl Blume, Professor Emeritus and world-renowned leader in Bone and Stem Cell Transplantation. Dr. Blume played a critical role in bringing together an outstanding group of basic and clinical scientists and in forging the initial interactions with the Northern California Cancer Center, whose members would enrich our expertise in population based research. In catalyzing our faculty, a truly wonderful effort was unleashed. The results were exemplary projects that were highly rated by a return visit of the External Advisory Board and ultimately by the Site Visit Team from the NCI. Coupled with the faculty initiatives were the selection of institutional leadership and the recruitment of individuals who would complement and enrich the leadership team. A critical appointment was that of Irv Weissman, Virginia & D.K. Ludwig Professor for Clinical Investigation in Cancer Research, as the Director and Principal Investigator of the NCI cancer center proposal, which was submitted in February 2006. In addition to Dr. Blume, key to the ultimate success of the grant proposal were the recruitments of Dr. Steve Leibel as Clinical Director and Dr. Bev Mitchell as the Deputy Director. This team encompasses the full range of connectivity from basic to translational research to patient care. And they do it with passion and excellence.

While we have known since the summer of 2006 that we achieved an excellent score in our 2006 application, we were prevented from making any public announcements until a number of budgetary and administrative issues were worked out at the NCI. That now being done, the April 18th announcement was wonderful news to our entire community.

I feel confident that we are uniquely poised to make important contributions to the future of cancer diagnosis, treatment and prevention. Equally important, we are well positioned to continue and enhance the basic discovery research that has led to so many innovations from Stanford over the years. By becoming an NCI designated Cancer Center I believe that our community will work even more closely together and join with others around the nation and the world to advance basic discovery, treatment and prevention. I also believe that the NCI designation will have an important impact on the quality, depth and breadth of our clinical programs and will permit us to be one of the most important and significant centers of excellence in cancer in the nation.

It did take a while to get to this point of success and affirmation –but it is a moment to celebrate, and it represents a new beginning and era for Stanford and our community locally and globally.

Dr. Paul Berg Is Remarkable in So Many Ways

Since coming to Stanford I have had the privilege of interacting and getting to know remarkable individuals who have transformed our world by their discoveries, innovations and accomplishments in patient care. Without doubt, one of the most extraordinary among these is Dr. Paul Berg, Robert W. and Vivian K. Cahill Professor of Cancer Research, Emeritus, who has also served as a Senior Advisor to me – a confidante, colleague and friend. Of course Paul Berg is world renowned for his scientific discoveries that led to the 1980 Nobel Prize in Chemistry for his fundamental work in recombinant DNA – which also spawned much of the revolution in biotechnology.

Because Dr. Berg has been part of the Stanford Medicine community since the Medical School moved to the University campus in 1959 he has both participated in and helped launch many of the remarkable changes that have characterized the past five remarkable decades and that have brought the medical school to international renown. In addition to being an extraordinary scientist and scholar, Dr. Berg has also been a committed and highly respected teacher and educator, admired and remembered by generations of Stanford students.

And now he has taken another step in demonstrating his dedication to Stanford and our community. Dr. Berg and his wife Millie have announced that they will contribute \$4 Million dollars to help launch the Learning and Knowledge Center (LKC) – see also: <http://lkc.stanford.edu/>. As you know, the LKC will be the centerpiece for the medical school – housing special facilities of simulation and virtual reality learning, small and large classrooms for medical and graduate students, a new conference center, quiet rooms and exercise facilities for students and more. It will be at the intersection of the school's missions in education, research and patient care and will help link these missions to the rest of the campus and to the hospitals. It will embody and facilitate our missions in Translating Discoveries and in the training and education of future leaders in medicine and science.

I am deeply touched by Millie and Paul's gift on so many different levels. Thanks to their generosity we are now one step closer to bringing the LKC to fruition (although we still have lots of additional such steps to make it a reality). But this gift also represents an affirmation by two wonderful members of our Stanford community of the value they place in our vision for the future – which the LKC will symbolize and embrace. Please join me in thanking Millie and Paul Berg for not only what they have contributed but also for what they will help to create and foster during the years and decades that lie ahead.

Appreciation to Wonderful Friends and Remarkable Students

On Thursday evening, April 19th we held our annual "Student Financial Aid Dinner." I must confess that this is one of my favorite events of the year – largely because it brings together wonderful individuals who have contributed to medical scholarships and financial support with the very students whose lives they have changed because of their contributions. It is an evening when students and donor families share stories about each other and get to know who they are and what matters to them. It helps start new relationships and give credence and life to the reality of how much it matters to have

individuals who are committed to enabling students receive an education that might have been out of their reach. At a time when medical school student indebtedness continues to soar we are also pleased that, thanks to the personal contributions of many individuals in our community, Stanford medical students have among the lowest levels of indebtedness at graduation – even though the majority are doing five or more years of medical school. As someone who needed scholarship support to attend college and medical school, I am personally cognizant of how much this means in shaping one's life and career – and in opening doors that might have remained un-open or even unknown.

Among the highlights of the dinner were presentations by three students – who represent their classmates and colleagues, since the personal story and sojourn of each of our terrific students is remarkable in its own right. This year our speakers were Cindy Mong, SMS III, Olushola Bidemi Olorunnipa, SMS II, and Cheri Blauwet, SMS IV. Each has traveled a different path and all shared how their passions in life both personally and professionally led them to careers in medicine and Stanford – and how their experiences as medical students and the support they have received from donors and our community will enable, foster and enrich their future lives and professional undertakings. Their words, as well as their artistic and athletic accomplishments, were inspiring and, together with the many talents and accomplishments of their classmates, serve to affirm why we are all so fortunate to be at Stanford – and to have students who will transform the future and donors who help to make that possible.

Medical Students Win a Number of Prestigious Fellowships

As you surely know, we have tremendously talented students at Stanford – in the MD and in the PhD programs. This year 24 of our medical students have won prestigious awards from a number of the most noteworthy and competitive foundations and organizations. They include the following:

Howard Hughes Medical Institute (HHMI) Programs

HHMI-Cloisters (at the NIH):

- Sonny Batra
- Jorge Caballero
- Reza Ehsanian (extending to a second-year at the Cloisters program and accepted into the NIH-Oxford PhD program for 2008)
- Katie Pricola

HHMI Fellowship:

- John DeCaro
- Andra Dingman
- Craig Giacomini
- William Goodyer
- Stanley Hoang
- Mark Hsu
- Steven Minear

- Elizabeth Zambricki

Doris Duke Fellowship:

- David Janka
- Gabriel Martinez-Diaz
- Lena Winestone

Sarnoff Fellowship:

- Trevor Chan
- Olakunle Ogunrinade

Soros Fellowship:

- Amit Kaushal
- Keyan Solari

Fogarty Fellowship:

- Melanie Gipp
- Marie Wang

Mt. Sinai International Exchange Fellowship:

- Debra Elena Garcia

Rotary Club International Fellowship

- Jolene Nakao

AOA Fellowship

- Aadel Chaudhuri

Please join me in congratulating each of these students.

Industry Relations and Conflict of Interest

More than six months have passed since we implemented the Stanford Industry Interactions Policy in October 2006 (see: <http://med.stanford.edu/coi/siip/>). Since then our policy and stance has attracted national attention and many other medical centers across the nation are beginning to take steps in a similar direction. On Sunday, April 15th I participated in a panel at the annual Council of Dean's Meeting of the Association of American Medical Colleges (AAMC) on the status and consequences of our policy. I have written about this topic a number of times in past Newsletters (see: http://deansnewsletter.stanford.edu/archive/06_26_06.html#1), and our Stanford Industry Interaction Policy (SIIP) Oversight Committee has been monitoring the implementation of the guidelines and addressing questions or concerns that arise from our internal or external community. If you are unfamiliar with the current guidelines you should review them at <http://med.stanford.edu/coi/siip/> since we fully expect all members of our community to be compliant with them.

To date the policy seems to be working across the medical center; for instance, to the best of our knowledge, the presence of industry related marketing that is not consistent with the policy has disappeared. This assessment is further supported by the inquiries and questions coming to the telephone or email hotline, although we recognize this is an organic and evolving process. We are also further refining the policies to address potential conflicts that might arise in physician prescribing practice and will be making questions about this area part of our annual conflict of interest disclosure. Coupled with

this is the need and responsibility to train and educate students, trainees, faculty and staff on appropriate and acceptable interactions with industry and, perhaps most importantly, to create a culture of ethics that permeates our entire community. I should add that the public attention being given these issues – by the press and by congressional leaders – affirms the importance of taking the kinds of steps we have done at Stanford to address concerns. Failure to do this will almost surely lead to external regulation that will likely be even more stringent and challenging.

Exchange on Tobacco Raises More Smoke than Illumination

In the April 9th Dean's Newsletter I wrote about the tobacco, human health and academic freedom (see: <http://deansnewsletter.stanford.edu/#1>), a topic that has engendered debate within the school and across the university. In my recent commentary I referred to a proposal put forth by Professors Robert Proctor, Hank Greely and Rob Jackler that, at its heart, stated that *“Stanford University will not enter into sponsored research agreements with companies that make or market tobacco products. In addition, Stanford University will not enter into research agreements with entities controlled by such companies, where those entities fund research on tobacco-related diseases, alternative causes of such diseases, or the uses and effects of tobacco, tobacco products, or their components.”* (The resolution would be reviewed in ten years time.)

As I noted in the last Newsletter, this proposal, which would change the current policy that *“Individual scholars should be free to select the subject matter of their research, to seek support from any source for their work and form their own findings and conclusions,”* prompted considerable debate and discussion at the School's April 6th Executive Committee. That debate continued at our April 20th Executive Committee and mirrored the April 18th discussion at the University Academic Senate that followed the reading by Professor Bernd Girod of the report from the Committee on Research – of which Dr. Girod serves as chair. As I discussed in my past Newsletter, no one seriously questions the abhorrent behavior of the tobacco industry. However, there is concern that accepting the Proctor proposal and, thus, deviating from the current policy, which has been in place since 1971, would challenge academic freedom and/or create a “slippery slope” that could infringe on the right of faculty to accept certain sources of funding or lead to a widening of the ban in the future. I certainly appreciate these concerns and believe that the best policy is to allow individual faculty to make the personal choice of what research they will do or how it will be supported. As such, I would not want to see any erosion of academic freedom or the opening of a door to a slippery slope of exceptions that could paralyze or politicize future research agendas, initiatives or pursuits.

That said, and as I conveyed in the April 9th Newsletter (<http://deansnewsletter.stanford.edu/#1>) I believe that this matter is more one of professional ethics than of academic freedom. The tobacco industry stands far apart from virtually every other comparison in continuing to produce and market a product that is associated with serious health consequences and death. They have done this in the past, do it presently and give evidence of doing so in the future. As such, I continue to believe

that it is important to differentiate this industry from others and to make an institutional statement about objections to this highly detrimental behavior. As we launch efforts to treat and prevent disease, it seems prudent to acknowledge that tobacco has been a major cause of morbidity and mortality and that, based on the tobacco industry's marketing in other nations (including developing nations), these health consequences will continue to mount in the decades ahead.

I fully appreciate the importance of universities being neutral to political agendas – although many faculty contribute to them in their professional or personal pursuits. But I also recognize that in our history universities have taken stands on important society issues, and the role of tobacco in our society is certainly one such example – and perhaps among the most egregious ones. If the concerns about infringing academic freedom by the Proctor proposal seem too onerous, perhaps other stances, such as banning all tobacco use on campus, would be a serious statement of concern. That too deserves serious discussion and consideration.

HHMI Opens a New Round of Competition

I hope that all faculty who are eligible have learned about the plan of the Howard Hughes Medical Institute (HHMI) to open a new round of competition. Unlike prior competitions, all eligible faculty are welcome to apply – there is not an institutional limit or cap on applications as has been the case in previous competitions. The deadline for application is June 13, 2007. Potential applicants must have a doctoral degree, hold a tenured or tenure track position as an Assistant Professor or higher rank (based on prior rulings from HHMI, only UTL faculty at Stanford are eligible) and they must have at least four but not more than ten years experience since first appointed as an Assistant Professor. Several other conditions also apply. If you think you are eligible and would like to apply please review <http://www.hhmi.org/research/competitions/investigator2008/> and <http://www.hhmi.org/research/competitions/investigator2008>. Additional facts on HHMI or on being an HHMI investigator are available at http://www.hhmi.org/research/investigators/investigator_faq.html and http://www.hhmi.org/research/investigators/investigator_faq.html.

I encourage faculty members who are interested in pursuing this opportunity to discuss this with their department chairs or with other HHMI investigators at Stanford (we currently have 14 HHMI members on our faculty). While the process is highly competitive, this is a unique opportunity and I hope that one or more of our faculty will be successful in this upcoming competition. HHMI welcomes applications from outstanding women and minorities underrepresented in the sciences.

Medical Senate By-Laws Continue Their Journey

As I reported in a recent Newsletter, (http://deansnewsletter.stanford.edu/archive/02_26_07.html#5), in February, the Medical School Faculty Senate unanimously approved a major revision of its Bylaws based on a year-long effort that included the establishment last summer of a committee led by Drs. Ron Ariagno, Professor of Pediatrics, and Oscar Salvatierra, Professor Emeritus of

Surgery, who worked in close collaboration with Senate Chair Dr. Sherry Wren and the Committee of Five. I am pleased to report that both the Executive Committee and the School's faculty at large have also voted their approval. The revised Bylaws will now be sent to President Hennessy and to the University Board of Trustees for final approval.

I believe that the revised Bylaws will be a significant improvement in the governance of the School, and I look forward to working with the Senate in their implementation. I also want to thank all the members of the committee who worked on this project: Ronald Ariagno, Carl Feinstein, Raymond Gaeta, Kathy Gillam, Ann James, Sarah Michie, Elizabeth Porter, Ellen Porzig, Oscar Salvatierra, and Sherry Wren. Their work is greatly appreciated.

Good News on Trips and Traffic

I have learned from Julia Tussing, Managing Director, Finance and Administration, that the results of this year's Parking and Transportation Services Peak-Period Trip Survey are in, and they are very encouraging for the School of Medicine.

I was pleased to see a the very significant increase in response rates for this year's survey, which rose from 33% last year to 52% this year, an increase of 58%. I was even more pleased with the results, which can be summarized as follows:

- The School of Medicine (SoM) drive alone "at least once per week" rate went down in the morning from 60% to 54%, and in the evening from 58% to 51%, for decreases of 11% and 14%, respectively.
- Our decrease in "typical" weekday drive-alone traffic was about twice as large as the University as a whole, from 45% to 36% in the morning and from 39% to 31% in the evening—a decrease of 25%! Out of the almost 2000 people responding, this equates to a reduction of 340 trips per day; if applied to the whole SoM population, almost double that.
- Our numbers are now very comparable to the University as a whole in both categories, whereas last year they were significantly higher.

Even assuming there are some sampling bias and size issues, these results are impressive. Congratulations and many thanks for the efforts of the Trip Reduction Coordinators in each department as well as the individuals who have made and kept their commitment to reduce trips!

Reaching Out to High School Students: Stanford 101

Thanks to the efforts of Michele Brandt and our Office Communications and Public Affairs, Stanford held a Med School 101 for approximately 130 high school students

from Palo Alto, Gunn, East Palo Alto Academy and Menlo High Schools on Friday April 20th. After an orientation to careers in medicine the students divided into small group sessions that focused on such topics as “Mind control for better living;” “Germs from the silver screen;” “Young at heart;” “Virtual surgery – performed by you!;” “To sleep, perchance to dream...but why?;” among others.

This was a great opportunity for students to learn more about the exciting opportunities unfolding in the biosciences and medicine. I am very appreciative to Michele Brandt and the Office of Communications for putting together this wonderful program.

Upcoming Events

- On Tuesday, April 30th (8:00 am – 4:30 pm), the First **Annual Symposium on Technology and Culture**, sponsored by the Stanford International Initiative, will be held in the Bechtel Conference Center, Encina Hall. The symposium is open to the entire Stanford community, but is designed primarily for Stanford faculty to share their work with other faculty as a means of promoting collaborative interdisciplinary work on various aspects of the symposium's theme. Come in for the entire day or drop in for individual panels. Registration not required. For further information: <http://cultechsymposium.stanford.edu>.
- On Wednesday, May 16th (11:00 am – 2:00 pm), the Annual **Medical Student Research and Population Health Symposium** will be held in Fairchild Auditorium Lobby. In addition to the original research presentations of MD and MD/PhD students, the first year class will present their Population Health Projects completed as a part of the Practice of Medicine course. Close to 70 students will be presenting.

Awards and Honors

- ***Stanford Medicine Wins Praise*** – I think you will all agree with me that the past years of the School's publication *Stanford Medicine* have featured informative and timely issues addressing important and often controversial topics. That was certainly the case for the most recent issue entitled the Silent Inferno that won (among other awards) Harvard's Neiman Foundation for Narrative Journalism and the Jon Marshall Award from Northwestern's School of Journalism. I am appreciative to Stanford Medicine's editor Rosanne Spector and Executive Director Paul Costello for their vision and outstanding leadership - and to the writers and faculty who have contributed to the excellence of *Stanford Medicine*.
- ***Dr. Jennifer Cochran***, Assistant Professor of Bioengineering, is a recipient of one of this year's Kimmel Scholar Awards. This highly prestigious award from the Sidney Kimmel Foundation supports the nation's most promising young cancer researchers who have demonstrated outstanding accomplishment and innovation.
- ***Dr. Rebecca Smith-Coggins***, Associate Professor of Surgery, has been elected for a term of four years to the Board of Directors of the American Board of

Emergency Medicine (ABEM). ABEM has established a reputation for high ethical standards and for quality in thought and process.

- **Cheryl Koopman, PhD**, Associate Professor (Research) in the Department of Psychiatry and Behavioral Sciences has been voted the President-elect of the International Society of Political Psychology (ISPP). ISPP is an interdisciplinary organization representing all fields of inquiry concerned with exploring the relationships between political and psychological processes.

Appointments and Promotions

- **Katrin I Andreasson** has been appointed to Associate Professor of Neurology and Neurological Sciences, effective 4/01/07.
- **David Apfelberg** has been promoted to Adjunct Clinical Professor of Surgery effective 4/01/07.
- **Juliana Barr** has been reappointed to Associate Professor of Anesthesia at the Veterans Affairs Palo Alto Health Care System, effective 5/01/07.
- **Paul S. Blumenthal** has been appointed to Professor of Obstetrics and Gynecology, effective 4/01/07.
- **Victor Carrion** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences, effective 4/01/07.
- **Michael J. Cherry** has been reappointed to Associate Professor (Research) of Genetics, effective 4/01/07.
- **Amarendra Das** has been reappointed to Assistant Professor of Medicine (Stanford Medical Informatics) and of Psychiatry and Behavioral Sciences, effective 5/01/07.
- **Alice A. Edler** has been reappointed to Assistant Professor of Anesthesia, effective 4/01/07.
- **Hayes B. Gladstone** has been promoted to Associate Professor of Dermatology and, by courtesy, of Otolaryngology (Head and Neck Surgery) effective 4/01/07.
- **Max Kanevsky** has been reappointed to Assistant Professor of Anesthesia, effective 4/01/07.
- **Edward R. Laws** has been appointed to Professor of Neurosurgery and, by courtesy, of Neurology and Neurological Sciences, effective 4/01/07.
- **Quynh-Thu Le** has been promoted to Professor of Radiation Oncology, effective 4/01/07.
- **Donald Mordecai** has been promoted to Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences effective 1/1/07.
- **Theo Palmer** has been promoted to Associate Professor of Neurosurgery, effective 4/01/07.
- **Jongsoo Park** has been reappointed to Assistant Professor of Neurosurgery at the Stanford University Medical Center and at the Lucile Salter Packard Children's Hospital, effective 4/01/07.
- **Renee Reijo Pera** has been appointed to Professor of Obstetrics and Gynecology and the Institute for Stem Cell Biology and Regenerative Medicine, effective 4/01/07.

- **Barry Press** has been promoted to Adjunct Clinical Professor of Medicine effective 9/1/06.
- **Uma N. Sundram** has been reappointed to Assistant Professor of Pathology and Dermatology, effective 5/01/07.
- **Pieter J.A. van der Starre** has been reappointed to Associate Professor of Anesthesia, effective 4/01/07.

Dean's Newsletter

May 7, 2007

Continuing Our Advocacy for Biomedical Research and Healthcare

This is a time when continued and very strong advocacy to support both biomedical research and radical improvements in our nation's healthcare system is critical and essential. Indeed these issues are completely interlinked. As I have frequently noted in prior communications, because of our nation's fifty-year investment in basic biomedical research, largely through the National Institutes of Health, the USA has dominated the world in discoveries in the biosciences and in the translation of this knowledge to improving human disease. This investment in the NIH has played a critical role in permitting our nation's leading research-intensive academic medical centers to train and develop generations of outstanding physicians and scientists. It has also allowed for the development of innovations and discoveries that have fueled and fostered biotechnology and economic health of communities – in addition to the creation of new diagnostic tools and instruments for the treatment and prevention of disease.

This has special relevance to California in general and to leading centers like Stanford specifically. For example, California leads the nation in the total amount of funding it receives from the NIH (\$3.6B), with the next most successful state being Massachusetts at \$2.2B. The impact of this funding has been enormous both scientifically and economically. For example, California also leads the nation in having the largest number of biomedical companies (currently 2700), which collectively employ some 258,000 individuals (above and beyond those employed at our academic medical centers, universities and research institutes). These successes have leveraged \$2.9B in venture capital investment in California biomedical companies and \$28B of reported private investment in research and development that have resulted in significant product development. Indeed the link between academic medical centers and industry is essential to bringing translational research to fruition in a way that improves the human condition. Reductions in biomedical research support not only slow down the basic discovery process and diminish the pipeline of future scientists and physicians, they also have a direct negative impact on industry and thus on the economic health of our communities, state and nation.

Ironically, during the past several years, this very investment and the world-class enterprise it has fostered and developed have become vulnerable to significant funding reductions by the Administration as well as the Congress. In fact, the Administration's

proposal for the NIH FY08 budget is \$500M lower than FY07 and if enacted would result in a 13% loss of purchasing power by the NIH since 2003, the year in which the NIH doubling was completed. Indeed this would further aggravate what is rapidly becoming a serious threat to the success of our nation's investment in biomedical research – at the very time that other nations are making significant investments and increasingly competing for the knowledge pool of trainees and scientists.

Thankfully, both the House and the Senate are now taking a more proactive stance in supporting the nation's investment in biomedical research. A letter in the House led by Representatives Ed Markey (D-MA) and David Reichert (R-WA) has garnered 186 signatures and is achieving bi-partisan support. A similar effort in the Senate, led by Senators Ted Kennedy (D-MA) and Orin Hatch (R-UT) to generate a parallel letter is achieving similar success. These letters call for a 6.7% increase in the FY08 NIH budget – which would at least hold the purchasing power commensurate with inflation. Although this would not restore the losses that have incurred in the past four years, it would prevent further deterioration. Given the lack of discretionary dollars, to a great extent due to the War in Iraq, this may be the best that can be hoped for at this point – although it is critical to make clear that flat funding will inevitably have serious consequences both now and over time.

We have been working to bring these messages to the Congress. On Wednesday, April 28th I joined Mike Bishop, Chancellor at UCSF, and several other academic leaders from California in a roundtable discussion that included industry CEOs who are members of the California Healthcare Institute along with Elias Zerhouni, Director of the NIH, and eight members of the California House of Representatives. We had a very successful interchange and were able to underscore the critical importance of basic research and of the partnerships between academia and industry that would be unraveled if support for the NIH continued to decline. Congressional Members expressed their support for research – and their recognition that the nation's investment in the biosciences helped fuel the biotechnology industry and our California economy. Following this roundtable I joined the CEOs and met with individual Members of the House and Senate to underscore this message. While at institutions like Stanford we certainly appreciate the importance of biomedical research in its own right, I think it is important to note that the Congress sees this even more clearly when the impact on industry is articulated by CEO leaders. Hence this is an approach that needs to be continued in other sectors as well.

The message about the importance of the NIH and of support for science was further underscored on May 2nd when the 2006 Nobel Laureates visited the Congress. We were fortunate and privileged to have both Andy Fire and Roger Kornberg meet with important committees and individually with a number of Members of the House and Senate. Based on the observations of Ryan Adesnik, Stanford's Director of Federal Relations, Drs. Kornberg and Fire were terrific in delivering this important message to the Congress, and we should all be appreciative of their efforts. I am copying below their written testimony since I believe it expresses well a message we can adopt in other communications, certainly in tandem with that underscoring the importance of our nation's continued investment in innovation. Their testimony follows:

Testimony of Andrew Fire, Professor of Pathology and Genetics and 2006 Nobel Laureate in Medicine and Physiology before the US Senate Subcommittee on Science, Technology and Innovation, May 2, 2007

Before we consider the value of science, we should first consider the goals of the scientific enterprise in this country.

Although each individual scientist brings a unique set of goals to their work, certain themes run throughout the scientific community and elsewhere:

Every American and every citizen of the world should have the opportunity to live a full and complete life without the ravages of tragic disease.

Every American and every citizen of the world should have access to sufficient resources and energy to fulfill their potential as individuals and as members of society.

Every American and every citizen of the world should have the opportunity to live in a world where they are safe from threats of terrorism, war, and other violence.

Our children, our grandchildren, and generations to come should have opportunities that are comparable to the best that our current society has to offer.

Scientific progress is by no means the only component in pursuing these goals. It is nonetheless a critical part. As our world inevitably changes, we will need to understand how these changes can affect our lives. As we become capable of greater manipulation of our environment, so questions of appropriate behavior, balance and sustainability become critical. We are at a turning point where technology and science will underlie most of the major decisions made by individuals, groups, and societies. There is no turning back from this.

Before we can talk about the value of science, we need to talk about limitations.

Science can help us to learn how the world works. Science can inform our decisions by allowing us to predict, albeit imperfectly, the concrete consequences of proposed action. Science and technology allow us to manipulate the world within us and around us using an ever-expanding array of tools.

Science can't, shouldn't, and doesn't supplant our value systems. The value we place on human life is not a scientific calculation. Likewise, the many issues we debate as a society: our allocation of resources between the young and the old, our definitions of the beginning and end of life, our ways to prioritize the individual and the society, our allocation of effort toward long term maintenance of the human race; all of these rely on fundamental value systems outside of and beyond

the scientific enterprise. Although scientific data (from molecular biology to theoretical physics to economics) can in some case inform ongoing debates as to the material consequences of each choice, the eventual decisions must come from our values and value systems.

Before we can talk about the value of science, we need to talk about opportunities.

From a portfolio too large to summarize, here are a few.

A dedicated war on cancer has been a flagship of the American scientific enterprise for the last 36 years. Inroads toward improving treatment of many types of cancer have been made in this interval, often based on a pipeline model that starts from investigation of fundamental biology and continues through careful clinical trials. The pipeline is by no means swift, but the initial results have made a difference between life and death, and between hope and despair, for millions of young and old people. Despite these advances, cancer still takes a devastating toll on individuals and families alike. We know that we can do more.

Infectious disease was declared to be a "closed book" in the 1960s, leading to a shift away from the commitment of this country to our public health agencies. This turned out to be tragically misguided. We now understand that new epidemics of infectious diseases are an intrinsic aspect of the dynamically connected society we live in: Flu, AIDS, SARS, Tuberculosis, Malaria and many more that we can only speculate on. Our capabilities for rapidly identifying and tracking infectious disease have never been better. Still, I am scared for the future. We know that we can do more.

Clean, safe, and renewable, energy production may become the most pressing economic, scientific, technical, and political challenges of the 21st century. Science has provided an armful of possible contributions in the form of new sources and dramatically improved efficiencies. Despite the recent burgeoning of a new energy industry, an upcoming global crisis in energy availability and in the consequences of our current use patterns seem virtually certain. We know that we can do more.

Before we can talk about the value of science, we need to talk about some of the challenges.

We do not train enough scientists, engineers, or doctors. We do not train enough teachers. To maintain a technologically driven society and to meet the challenges ahead, we need to vastly increase the number of technically trained individuals ready to work in all areas. Our needs in the area of science education are evident at all levels: in elementary, middle, and high schools, in college, graduate, and professional schools, in continued training of our scientific workforce, and in the sophisticated scientific training that the general public will need to make rational decisions. In none of these areas are we completely lost. Education in this

country has a remarkable history. Many of our institutions are unparalleled in their quality anywhere in the world. At the same time, many of our young people never get the chance to make contributions that could uniquely benefit the society because their communities lack the needed educational opportunities. This is not an area that we can afford to ignore. Investment in education is an investment in our future. A neglect of this opportunity at any level would be a colossal mistake.

The critical early discovery stages of the developmental "pipeline" for science and technology often take place, by nature and by necessity, in universities and non-profit research centers. Research of value in such open environments has only been possible with public support of federal agencies. This research has driven both innovation and discovery in American science to an extent that the scientific enterprise in the US is truly and uniquely a societal effort. In this realm we face a continuous challenge in maintaining a productive and creative scientific enterprise under the inevitably fluctuating conditions of public support. Science in the US has thrived on a competitive granting system, a sink-or-swim arrangement that does a remarkable job in funding the most important and highest quality research while driving the establishment as a whole toward excellence. But how do we handle the inevitable instability in supply and demand, in the cost of research, in the size of the academic workforce, and in policies and outlook of the institutions of higher learning that are partners with the government in making this work? In times of expansion, there is ample room in the system for all types of ideas, all points within the pipeline, and all levels of venture-risk. In times of contraction, we all fear that the next grant review might end our research careers. Clearly, the solution here cannot be an infinite and exponential growth of the public research enterprise. Private support for science can smooth out some of the rough spots, but as a small fraction of the total there is simply not enough private support for more than a token level of stabilization. To allow some stability, interactions between research institutions and federal funding agencies are crucial: many grantee institutions are finding that their role must now include a clear commitment to bridging support for their faculty, employees, and for ongoing scientific projects, even as they recognize that moving forward will only happen with federal support. More institutions will realize this over the next few years. At the same time, the great value of continuity in our public investment in science and technology needs to be communicated. We are at a crossroads in this area in the biomedical community with many critical research programs that may not survive the next few years, many creative senior investigators shutting their labs, and many potentially brilliant young investigators afraid to choose careers in a field this unstable.

Discovery-based investigations in academia make up just one segment of the larger scientific enterprise. Even the most important of basic discoveries make their impact through a development process that involves extensive further research in academic settings combined with research and development in the commercial sector. Translation of basic discoveries toward beneficial results relies on additional groups of dedicated and highly trained scientists, physicians,

engineers, and others. Fulfillment of the potential from academic discoveries also requires massive investment in the commercial sector, considerable risk-taking, and a real chance that any given project will fail. In the biomedical area, we simply do not know enough about the individual human body or about the diversity in our species to predict the outcome for a proposed new treatment. Clinical trials must be done, they must be done carefully and safely, they are extremely costly, and a fraction give a disappointing result. Given the costs of clinical trials, the vast majority must be carried out in the private sector. When there is success, we have great advances in medicine. Although we also learn from the failures, this is rarely a consolation to the affected shareholders. For commercial translation of scientific discovery to continue there needs to be a reasonable expectation of possible return on investment. Much of this relies on the US Patent system, itself a gigantic and often cumbersome endeavor that like so many of our institutions is both imperfect and the best we have. The patent system doesn't operate in an economic vacuum. For commercialization to benefit society there also needs to be a mechanism where technologies are available at prices that allow accessibility by all Americans who are in need. One of the lessons we may hope to learn over the next few years is how best to incentivize the risk-taking that is essential in commercial technology development while providing new technologies affordably to all who are in need.

As basic and applied scientists in education, academics, government, and industry we can make the greatest positive impact by supporting each others endeavors, training each other in the areas that we know best, and by listening to each other to understand the needs and potential of fields that are unfamiliar.

Before we can talk about the value of science, we need perhaps most urgently to talk about our own responsibilities as scientists.

It is our responsibility to continue a scientific enterprise directed toward improvements for all Americans and for all people everywhere.

It is our responsibility to seek out and pursue areas of inquiry where scientific progress could benefit humanity, whether it benefits a few individuals, a few communities, countries, continents, or the entire human race.

It is our responsibility at each stage of scientific inquiry to integrate our work into the larger scientific community both in the US and worldwide.

It is our responsibility carry out our research in an ethical, truthful, and open manner and to follow the rules and restrictions set down by our governments and our conscience.

It is our responsibility to maintain a pride in the creativity and uniqueness of our own thought and research, while acknowledging and fostering the ideas and contributions of others.

It is our responsibility as scientists to be leaders in teaching science at all levels.

It is our responsibility to communicate the scope of scientific opportunities and the spectrum of progress to our leadership, to the public, and to our neighbors around the world. At the same time, it is an equal responsibility to communicate the limitations of our work, the challenges that we face in improving the human condition and the risks that come from increased ability to manipulate our bodies and our environment.

The 21st century will bring new challenges, new opportunities, new risks, new technologies, and new understanding. It is our responsibility as scientists to make these work to the benefit of our society and of all humankind.

We will do our best.

Testimony of Dr. Roger Kornberg, Winzer Professor, Department of Structural Biology and 2006 Nobel Laureate in Chemistry before the US Senate Subcommittee on Science, Technology and Innovation, May 2, 2007

Chairman Kerry, Ranking Member Ensign, and Members of the Subcommittee, I am grateful for this opportunity to describe our research to those who support it. I will give a brief account of the research, its significance, and future prospects. Then I wish to explain some of the challenges we face and how they may be overcome.

The control of gene expression

Our research has to do with genes, which direct the formation and the activities of our bodies. Every cell in our bodies contains a complete set of genes. Which subset of genes is used in a particular cell determines whether it becomes nerve, muscle, blood, liver and so forth. The goal of our research and that of many others has been to understand how this controlled use of genetic information is accomplished. The practical implications are enormous. All infectious disease entails genetic control. Cancer results from a breakdown of control. Therapeutic approaches such as stem cells require intervention in genetic control.

Genetic information has been likened to a blueprint or a book. In order to use the information, the book must be opened and read. Our work has uncovered principles of both the opening and the reading of genetic information. We are now close to understanding genetic control.

The nucleosome, fundamental particle of the chromosome

Genetic information is contained in a long thin molecule of DNA. Human DNA is a meter in length and must be compressed to a micrometer in our cells. This might be accomplished in an organized way by spooling, as is done for sewing

thread or garden hose. The problem is that to gain access to a gene in the middle, the entire length must be unspooled. Nature has solved this problem by the use of mini-spools. I proposed in 1974, and it has since been verified, that DNA is wrapped around a set of eight protein molecules in a particle known as the nucleosome. A million of these particles are strung together in a human chromosome. For access to a gene in the middle, only a few particles need be unspooled, while the rest are left undisturbed. Unspooling is a key control point for gene activity, and is already a promising target of anticancer drugs.

RNA polymerase, the gene-reader in our cells

Once DNA is unspooled, the genetic information can be read. The gene reader is a protein machine known as RNA polymerase, which copies the genetic message into a related form called RNA, in a process known as transcription. RNA directs the synthesis of proteins, which perform all bodily functions.

In work done over the past 25 years, we have obtained a picture of RNA polymerase in the act of transcription. RNA polymerase is composed of 30,000 carbon, oxygen, and nitrogen atoms. Our picture shows the precise location of every atom. In this picture, we see the DNA double helix entering the polymerase machine and the RNA product as it is formed and released. This picture has revealed the basis for readout of the genetic code, and how occasional mistakes are corrected. It has already been employed for the design of new antibiotic drugs.

The future: A molecular computer for the control of gene expression

RNA polymerase does not act alone in the readout of genetic information. An additional 50 protein molecules participate directly in transcription. We discovered, in particular, a giant assembly of 20 proteins called Mediator that serves as a kind of molecular computer. Mediator receives information from inside the cell and from the environment, which it processes and delivers to RNA polymerase. A major objective for the next decade of our work is to determine the atomic structure of Mediator and to understand the control of transcription. We already know that mutations in genes encoding Mediator can cause cancer. Knowledge of Mediator structure will enable us to correct many such problems and to intervene more generally in the control of gene expression.

The challenge of funding basic research

Our work has been supported almost entirely by the NIH. The cost was about \$20 million over 30 years, mostly for the stipends of the more than 80 graduate and postdoctoral trainees involved. Due to current constraints on the NIH budget, virtually none of our work would be funded today. I can say with certainty that a grant application for the research leading to the discovery of the nucleosome, fundamental particle of the chromosome, would not be approved. The reason is simple: I had no idea at the outset of what I might find, and no good idea of how to go about it. Our RNA polymerase structure work was supported by NIH only after it became clear it would succeed. When we began, the prospects for success

were virtually nil – no way of producing the RNA polymerase, no hope of forming the crystals needed for imaging, and no technology for deriving the image.

The reason for the disconnect between funding and discovery is clear: funds are awarded for compelling ideas, supported by preliminary evidence, creating a high likelihood of success. But discoveries are by their nature unanticipated, completely unknown. They cannot be sought out in a deliberate manner. They cannot be proposed to granting agencies or evaluated by review groups. So how are discoveries made in the American system? The answer is by risk-taking. Scientists supported to do straightforward research may divert some of their funds for testing new ideas. If they succeed, then the results form the basis for new grant applications. If they fail, they may be in trouble and be unable to continue even with their original research.

The risky nature of truly innovative research is both the strength and the Achilles heel of our system. In the past, when NIH funded approximately 20% of new grant applications, most capable investigators could obtain support, some of them would conceive of and try new ideas, and occasionally an important discovery was made. Today, with funding levels at 10% or less, many fine investigators have lost their support, few will take risks, and the pace of discovery will fall dramatically.

In the March 23, 2007 issue of Science magazine, Senator Arlen Specter is quoted as asking the reasonable question “What’s going to happen to NIH if the budget is cut by \$500 million?” The answer is that the number of publications from NIH-sponsored research will decline accordingly, by about 5%, but innovation will be stifled across the board. The chilling effect of funding cuts ripples through the system, deterring bold action and creativity on the part of established investigators, and discouraging young scientists from entering the system. This has already happened. My European colleagues have noted a reverse brain drain already occurring now.

There is another way in which small budget cuts can have a disproportionate effect. Research is highly synergistic. One part depends on others. For example, my own determination of the RNA polymerase structure was critically dependent on the work of hundreds of physicists and engineers, on synchrotrons such as that at the Stanford Linear Accelerator and on cutting edge photon physics.

Of all the adverse effects of flat-funding or even cutting the NIH budget, the disillusionment of young people is the worst. The choice of a career in science already represents a great sacrifice. A passion for science must be weighed against a long period of training - 10 or more years of postgraduate study at low wages - and the possibility of no career at the end. The importance of young scientists cannot be overstated. To paraphrase an illustrious politician, it’s the people, stupid! Progress in science, and discovery in particular, is the work of the

best young minds. America has taken pride in the Nobel class of 2006, present here today. If we do not take action now to restore enthusiasm for the pursuit of science, there will be no American class of 2026.

Discovery as a driving force of progress

Much has been said about the value of basic research, and I am sure the arguments are well known to you. I would like to add some points not so often stated. Scientific medicine is comparatively new, just over a hundred years old. The advances already made have impacted the lives of us all. Every major advance can be traced to a discovery made in the pursuit of basic knowledge, not for a medical or economic purpose. Some examples are X-rays, antibiotics, magnetic resonance imaging, recombinant DNA, and structure-based drug design. Future advances, including the prevention or cure of cancer, AIDS, Alzheimer's, and other dread afflictions, will come from new discoveries and new information. Efforts currently targeted towards these and other worthy ends are unlikely to succeed. I recall the words of Lyndon Johnson to the effect of "life-saving discoveries locked up in the laboratory." This serious sentiment was mistaken. Application of existing knowledge is not the limiting factor. The knowledge itself is limiting.

It has been remarked that we know 1% of everything about the human body. A small fraction of a percent would probably be more accurate. But consider how enormous have been the benefits to our health and our economy from what little we know now. Imagine how great would be the benefits of knowing the remaining 99%!

There is a further overarching purpose to basic research. An urge to explore is a part of our nature. It was a major factor in the evolution of our species. It has motivated us to go to the moon and to outer space. The exploration of inner, human space is no less grand. It is also an expression of the human spirit.

In addition to the meetings we had in Washington, we were also visited at Stanford on May 2nd by a delegation from the Office of Secretary of the Department of Health & Human Services Mike Leavitt regarding Stanford's approach to "personalized medicine" and the use of new technologies to improve health care. I was joined in this discussion by Drs. Sam Ghambir (Radiology and Molecular Imaging), Henry Lowe (Clinical Informatics and Information Resources & Technology), Iris Schrijver (Molecular Genetic Pathology), Ralph Horwitz (Medicine) and Russ Altman (Bioengineering). I began the discussion by underscoring that efforts to develop personalized medicine (which is still a work in progress) would be squandered – or at least would not achieve optimal fruition – if we did not have a concerted effort to develop a more rational system of national health care and to create a focus on wellness in addition to disease management. At the same time, our faculty leaders shared some of their research accomplishments in developing tools that will dramatically improve early detection of disease and more patient-specific approaches to diagnosis, treatment, disease management and prevention. But unless we also deal more successfully with the large number of individuals who do not have access

to health care as well as the soaring costs, such research findings may further dichotomize the nation into those who have opportunities to benefit from these new discoveries and those who do not – a problem seriously challenged by the wide gulfs in health literacy.

Without question our ability to improve health care and reduce its costs depends on our nation's willingness to make a more serious commitment than it has to date to the development of a more rationale system that is more economically sustainable, better accessed and driven by quality rather than price. But the future improvement in health care costs and outcomes is also highly dependent on our nation's continued investment in biomedical research – for both discovery- based research as well as for clinical and translational research. The latter is critical in order to foster partnerships with industry to develop products and devices that create more specific and successful opportunities for diagnosis, treatment and prevention. These issues are inextricably linked and we must do all we can to advocate for their support and adoption – the health of future generations and of our nation depends on those investments and their outcomes.

LPCH Launches the “Breaking New Ground” Campaign

Wednesday, May 2nd was a magical evening for the Lucile Packard Children's Hospital and Stanford Pediatrics. LPCH President and CEO Chris Dawes, having gathered faculty, staff and numerous supporters, members of the LPCH Board of Directors and volunteers, hosted a dinner event that culminated in the announcement of the new campaign entitled “*Breaking New Ground.*” During the past decade LPCH has risen to become one of the most prominent children's hospitals in the nation, and the Pediatric Programs at Stanford have grown significantly in both scope and excellence. Despite my usual reservations about US News & World Report rankings, I was pleased to note that Stanford Pediatrics was now ranked 6th in the nation (recognizing of course that this is really a reputation score rather than one based on serious metrics). But there is no question that LPCH, Stanford Pediatric Medicine and Surgical Services and their academic programs are “on the move.” Indeed, they are destined to take another step forward with the recently announced recruitment of Dr. Hugh O’Broovich as the next Chair of Pediatrics at Stanford and Chief of Staff at LPCH (see: <http://deansnewsletter.stanford.edu/#1>). One of the important reasons for the success of LPCH and Stanford Pediatrics has been the incredible financial support that has been raised by the Lucile Packard Foundation for Children's Health in tandem with the David and Lucile Packard Foundation.

Given the planned significant physical growth of LPCH to support essential clinical programs and to help relieve the serious capacity problems that sometimes now result in having to turn patients away because of the lack of beds, along with the plans to further enhance the academic and research programs in pediatrics, additional resources are needed. Accordingly the announcement by LPCH Board of Directors members Ann Bass, Elizabeth Dunlevie and Susan Packard Orr that a new campaign for \$300M was being launched was welcomed and celebrated by all – but when they further announced that \$163M has already been committed, the reaction was understandably jubilant. While there is a clear recognition that much hard work remains to achieve the goal set by this

new campaign, the accomplishments to date by LPCH, LPFCH, Board members, Stanford faculty and community supporters, volunteers and donors are simply extraordinary. While we can all be proud of what has been accomplished to date it is remarkable to contemplate what will be achieved in the years ahead that will surely improve the lives of children and families.

Congratulations and deep appreciation to all!

Medical School Hosts University Academic Senate

On Thursday, May 3rd the School of Medicine hosted the elected and ex officio Senators of the Stanford University Academic Council. This is the second time during my tenure at Stanford that the Senate has crossed Campus Drive to visit the medical school. We used the opportunity to provide an update on how we have been progressing with our Strategic Plan “Translating Discoveries” and its evolving impact on our missions in education, research and patient care. I also provided an update on the master facility planning efforts underway at the Medical School and Medical Center. Such a visit provides an opportunity for faculty less familiar with the medical school to learn more about our unique and special efforts and accomplishments – and also to provide a vision of where we are heading in the future. In addition, the visit provided an opportunity for Senators to visit various programs and get some hands-on experiences. Thanks to the efforts of Kristin Goldthorpe and Kathy Gillam, along with a number of our faculty and staff, we were able to host four tours, including:

- I. ***The Stanford Cancer Center*** (<http://cancer.stanford.edu>), hosted by Beverly Mitchell, M.D., Deputy Director, and Steven Leibel, M.D. Medical Director. It should be noted that after more than 30 years, the Cancer Center has received recognition as a NIH Cancer Center.
- II. ***The Goodman Simulation Center*** (<http://goodmancenter.stanford.edu>), hosted by Tom Krummel, M.D, Chair of Surgery
- III. ***Neonatal Intensive Care Unit*** (<http://neonatology.stanford.edu>), hosted by William E. Benitz, M.D., Interim Chief of Neonatal and Developmental Medicine
- IV. ***Imaging Center in the Clark Building*** (<http://mips.stanford.edu>) hosted by Christopher Contag, Ph.D. Co-director and Director of the Stanford Center for *in vivo* Imaging.

Because of the focus on the medical school and tours, the Academic Council did not conduct other business on May 2nd. However it was announced that on May 17th, the next scheduled Senate meeting, the issues surrounding tobacco use (see: <http://deansnewsletter.stanford.edu/#7> and <http://deansnewsletter.stanford.edu/#7>) will again be discussed.

Medical School Students and Graduates - Past and Future

The sequential weekends of April 26-29th and May 4-6th brought admitted MD students who are deciding whether to matriculate at Stanford followed by returning MD and PhD alumni of Stanford University School of Medicine. Both weekends were characterized by enormous energy, excitement, pride and memories. Some 90 admitted MD students arrived on April 26th (one of the largest number of students to ever participate in admit weekend) and participated in an array of informational sessions as well as social functions that helped further acquaint them with the exciting programs taking place at Stanford. They met students, faculty and staff and learned about the opportunities here that are truly unique and exciting. They also attended dinners and the annual medical student talent show. According to Dr. Gabe Garcia, Professor of Medicine and Director of Admissions, more than 6500 applicants were received this year for our 86 places. The quality of the applicants – and of course of the admitted students – is extraordinary. They will be making their final decisions by May 15th. At the same time, the Bioscience PhD programs have also had an extraordinary group of students apply for matriculation and they too will finalize their decisions by May 15th. We are blessed by having a remarkable student body at Stanford and the class that will enter in the Fall of 2007 appears to destined to continue and even enhance that tradition.

Just as new students were thinking about the impact of Stanford on their future, this past weekend graduates from the MD and PhD programs as well as residency and fellowship programs returned for the 2007 Alumni Weekend. It was a time for nostalgia as well as opportunity to learn more about where the School is heading for the future. Various lectures, symposia, tours and social events provided exciting and variegated venues to our alumni. Among the highlights was the Annual JE Wallace Sterling “Muleshoe” Lifetime Alumni Achievement Award Ceremony and Dinner, which was held on Friday evening, May 4th, at which awards were presented to Drs. Linda Hawes Clever, MD’65 and JD Northway, MD’60. On Saturday morning, May 5th a Symposium on Infectious Disease Challenges was held in the Fairchild Auditorium, and in the afternoon a Symposium entitled “RAN: How It Is Made, What It Looks Like, and What It Is Good For” was held in the Munzer Auditorium. In addition there were tours of the Jasper Ridge Biological Preserve, the Medical Center, the Cantor Center for the Visual Arts and the Stanford Linear Accelerator. On Saturday evening, class dinners – including a very well attended 50 year class reunion – followed the “Dean’s Cocktail Reception,” which I hosted.

It brings indescribable joy to witness the fondness that alumni have for Stanford and the esteem that prospective students have for joining our community – clearly affirming why we should be proud to be members of the Medical School and Medical Center.

Special thanks to our students, staff and faculty leaders, along with the Office of Student Affairs and Stanford University Medical Center Alumni Center, for making these programs and events so successful.

Endurance as One Metaphor for Success

At various leadership discussions and events I have been asked about the factors in my own life and career that have enabled success. Among a number of personal experiences

and factors, I often highlight the importance of physical endurance, health and well-being as important components of leadership. Many leadership positions today are viewed as “extreme jobs” and often consume workweeks not infrequently measuring 80 or more hours, with many stresses and challenges during the day and events in the evenings and weekends. Keeping up with a demanding schedule, constantly changing agendas and important issues that impact the lives of people and programs requires a wealth of energy, focus, commitment and determination. But success in achieving programmatic agendas also requires flexibility, adaptation and sharing the responsibility for the mission as a whole, for the individuals involved – and for one’s own success.

Each of us has different features of our lives that help create our identity and shape who we are – or think we are. Quite naturally, our personal assessments must also be balanced by external metrics that provide reality checks on performance and tangible outcomes.

I have often commented in small group discussions that, at least for me, in addition to intellectual and programmatically driven metrics of success, I also feel strongly about personal measures that include physical and athletic activity. There are many forms for this but as some of you know, for me it is measured in long distance running and periodic competitions. It is hard to fit this into busy schedules but I view it as a priority and so engage in it in the very early morning hours – generally arising around 4 am – and doing 8-10 miles weekday mornings and twice that on Saturdays, while listening to unabridged books (I guess this is a way of fusing cognitive and emotional pleasure with physical endurance).

To me, the marathon is a metaphor for the kind of endurance activity that gives me a sense of confidence during my workday – a feeling that even though the issues may be tough and take a long time to achieve, one can get there if you pace yourself, adapt your plans and stay focused on where you need to go. I was reminded of this once again on Sunday, April 29th when I ran the Big Sur Marathon that begins at Pfeiffer State Park and ends 26.3 miles later in Carmel. It is a challenging course and the official guidelines state that runners should anticipate finishing times at least 20 minutes slower than “usual” marathon times. For me there is something significant about lining up with thousands of individuals who share a common goal. In the Big Sur this was 3000 men and women – but in the NYC Marathon that I did last November it was ten times that number! Regardless, there is a sense of community at the beginning of a marathon – of a mass of humanity that slowly erupts on a forward trajectory.

But while one is part of something that may be greater than the whole of the individual parts, one is also a single engine and within minutes it is clear that all the runners have to plot and plan their individual journeys, while also paying attention to the individuals who surround and engulf them. In the case of a challenging course like the Big Sur Marathon, you know at the beginning that there will be large and small hills, ups and some downs. But it is hard to gauge how you will feel at future time points and, more importantly, how you will preserve your energy to achieve the endpoint and to adapt to the conditions that may require changes in plans or expectations. If one gets too swept up with the enthusiasm and adrenalin of the start – and joins the group that seems ready to sprint out

quickly – you might do either very well or very badly as the time and the miles present new challenges.

For me last Sunday's Big Sur Marathon was an unknown. I knew from prior experiences that I had completed this distance many times. But I also knew that I had experienced a significant respiratory illness in the months preceding the event as well as a pulled tendon. So, there was natural uncertainty about how things would turn out. But thankfully, despite those worries and concerns, all was well that ended well.

While all this may seem tangential to a "Dean's Newsletter" I would like to suggest that it is highly relevant. Each day I face – just as you do – lots of challenges, some which have immediate solutions but many of which do not. For me, the confidence that I can complete individual tasks or take on challenging issues like configuring and implement a strategic plan such as "*Translating Discoveries*," or take a long view toward a facilities master plan, engage in the ups and downs of faculty recruitment, raise philanthropic funds and countless other tasks comes from knowing that in a totally different part of my life I have learned to take the long view: keep my eyes on the goal; set a pace but be prepared to speed up or slow down depending on the conditions; be prepared for the unexpected turns in the course or find that those which were anticipated are actually different than forecast; be aware of the rhythms of the individuals who come in and out of one's field; occasionally pause to refuel but always, despite what may seem endless, to keep moving forward – and perhaps most importantly, to be "in there for the long run." That is why, at least for me, accomplishments in personal endurance serve as at least one metaphor for success.

Thanks to Our Ombudsperson Martha McKee

After ten and a half years of service as the Ombudsperson at the School of Medicine, Martha McKee will be leaving the School in June. She will be relocating to Tucson, Arizona. Martha has been a wonderful asset to the School and has been instrumental in assisting hundreds of visitors to the Ombuds Office with academic and work related problems. She has maintained a confidential and neutral resource for our community by practicing ombuds work at the highest levels of professionalism. Those of you have interacted with Martha know her to be a kind and compassionate listener who cares deeply about the welfare of individuals in our community. I understand and applaud Martha's desire for new professional challenges and personal opportunities. Please join me in wishing her the best for the future!

Help Us to Assess "Job Satisfaction" Among Faculty at Stanford

I want to inform you of an opportunity to participate in a survey on faculty job satisfaction. This survey research is part of a national pilot study co-sponsored by the Association of America Medical Colleges (AAMC) and the Collaborative on Academic Careers in Higher Education (COACHE).

The purpose of the survey is to learn how faculty members view specific institutional policies here at Stanford University and to gauge your current job satisfaction compared

to faculty at peer institutions. To ensure confidentiality, the AAMC and COACHE will publish only aggregated results in which individuals and institutions cannot be identified. The AAMC and COACHE will not use any individual faculty member's name or email address for any purpose other than to contact you to participate in this study.

The AAMC and COACHE will provide our medical school with their summary analysis only; the surveys are completely confidential and will be handled through the COACHE project team. Your privacy will be maintained in all published and written data, and your identity will be carefully protected in any information shared with Stanford. We welcome this opportunity to learn from an independent, comparative study, and we hope the results will help us improve our faculty's career satisfaction and success.

During the week of April 23 you received a web-link in an email from Harvard, directing you to the survey. The survey is easy to complete, and should take no more than 20-25 minutes of your time. If you have any questions about this survey, please contact Claudia Morgan at cjmorgan@stanford.edu or 723-2329, or COACHE at coache@gse.harvard.edu or 617-496-9344. I encourage you to participate in this study, and thank you for your cooperation and collaboration.

Upcoming Events

Medicine and the Muse

Monday, May 7 -- tonight

5:00 – 7:00 pm

McCaw Hall, Arrillaga Alumni Center

You are invited to the annual Medicine and the Muse Event that has been organized by our students and faculty to celebrate the interface between the arts and medicine. Tonight's event features music, literature, visual and performing arts and more. Dr. Stephen Bergman, author of "The House of God" and "Mount Misery," will deliver the keynote address. A reception, which is open to the public, will follow the event. It will be held in McCaw Hall at the Arrillaga Alumni Center. I want to thank James Andrews, SMS III and Dr. Audrey Shafer, Associate Professor of Anesthesia and Co-Director of the Scholar Concentration on Bioethics and the Humanities, for their efforts in organizing this year's Medicine and the Muse event. For additional details see <http://bioethics.stanford.edu/arts>.

Wellness Fair

Wednesday, May 9

10:00 am – 3:00 pm

Arrillaga Center for Sports and Recreation

This year's Wellness Fair will take place on Wednesday, May 9th, and Provost John Etchemendy has written to encourage everyone to attend. In case you missed his message, I include it here:

Dear colleague,

Please join me at this year's Wellness Fair on Wednesday, May 9, from 10 a.m. to 3 p.m. in the Arrillaga Center for Sports and Recreation.

I've written to your supervisor, asking that you be encouraged to attend. So while you're at it, please bring your boss to this event, too! The health of each and every Stanford employee is important to us.

This year's Fair is co-hosted by the Benefits Department and the Department of Athletics, Physical Education, Recreation & Wellness group. They plan to show all of us ways to improve our physical and mental well-being. I think it will be a fun and informative event.

Here are a few of the things you can do at the Fair:

- Have your blood pressure, body fat, bone density, strength and flexibility, and cholesterol measured
- Test your fitness with a Stanford fitness trainer
- Enjoy healthy food demonstrations
- Try out stationary bikes, elliptical trainers and rowing machines
- Get a bike safety check
- Learn more about ergonomically correct workstations and healthy work postures
- Observe Pilates, fencing, rock climbing, self-defense and yoga classes

I'll be there. I hope to see you, too.

John Etchemendy

P.S.

Save the Date - May 31, 2007 - for the all campus "Cardinal Walk" at Roble Field. Join us for refreshments and free pedometers to the first 2000 people registering at the event starting at 11:30 am. The walk, led by Provost John Etchemendy, will begin at 12:05 pm and is a 1.5 mile route through campus. We look forward to seeing you at the first annual Cardinal Walk. Questions can be directed to Jennifer Sexton at jbsexton@stanford.edu

I would like to add my enthusiastic endorsement of the Wellness Fair, as well as the subsequent Cardinal Walk. These are excellent opportunities to focus attention on crucial aspects of personal well-being, and I strongly encourage you to take advantage of them.

Awards and Honors

- ***Leiberman Fellowship Winners:*** I was very pleased to learn that PhD candidate Chun-chun Chen, Neurosciences Program, and MD/PhD Candidate Ricardo Paniagua, Immunology Program, have received Lieberman Fellowships for the 2007-08 year. This is the first year in which the School has received two of these Fellowships.

The Lieberman Fellowships are named in honor of one of Stanford's most distinguished citizens, Provost Emeritus Gerald J. Lieberman. A member of the Department of Statistics and Operations Research, Professor Lieberman achieved eminence as a scholar, teacher, and university statesman in a career that spanned 43 years as a student and faculty member at Stanford. Besides serving as Provost, he was the Vice Provost and Dean of Research and Graduate Studies from 1980 until 1985. Throughout his years as a teacher and administrator, Professor Lieberman took a strong interest in advancing the educational opportunities and well being of graduate students.

In honoring Professor Lieberman by establishing a graduate fellowship program in his name, Stanford also honors the qualities of outstanding scholarship, teaching, and university service that his career exemplifies. The intent of the program is, in some measure, to recognize and promote the same qualities in young scholars.

Congratulations to these outstanding students!

- ***HHMI Fellowships:***
In my April 23, 2007 Newsletter I listed the talented students who won prestigious awards. I would like to add and congratulate **Mark Chao** for also receiving an HHMI Fellowship this year.

Appointments and Promotions

- ***Arlina Ahluwalia*** appointed promoted to Clinical Assistant Professor of Medicine, effective 6/01/07.
- ***Sadick Alsadir*** has been appointed to Clinical Assistant Professor of Medicine, effective 5/01/07.

- ***Cheryl Cho-Phan*** has been appointed to Clinical Assistant Professor of Oncology, effective 5/01/07.
- ***Mark Cohen*** has been appointed to Clinical Assistant Professor of Pediatrics, effective 5/01/07.
- ***Cornelia L. Dekker*** has been promoted to Professor (Research) of Pediatrics (Infectious Diseases), effective 5/01/07.
- ***Sonja Dieterich*** has been appointed to Clinical Associate Professor of Radiation Oncology; Physics, effective 6/04/07.
- ***Dawn C. Duane*** has been promoted to Clinical Assistant Professor of Neurology & Neurological Sciences, effective 5/01/07.
- ***Kevin Garber*** has been appointed to Clinical Assistant Professor of Neurology, effective 4/01/07.
- ***Laura Gross*** has been appointed Clinical Assistant Professor of Medicine, effective 6/01/07.
- ***Keith N. Humphreys*** has been promoted to Professor (Research) of Psychiatry and Behavioral Sciences, effective 5/01/07.
- ***Neil Schwartz*** has been appointed to Clinical Assistant Professor of Neurology, effective 5/01/07.
- ***Gavin Sherlock*** has been reappointed to Assistant Professor (Research) of Genetics, effective 4/01/07.
- ***Lawrence Siegel*** has been appointed to Clinical Associate Professor of Anesthesia, effective 10/01/06.
- ***Connie Teresi*** has been appointed to Clinical Assistant Professor of Medicine, effective 4/14/07.
- ***Laraine Zappert*** has been appointed to Clinical Professor of Psychiatry, effective 5/01/07.

Dean's Newsletter

May 21, 2007

Promoting Health: Extending a Ban on Smoking

During the past few months there has been considerable discussion at Stanford about whether the University should prohibit research funding from the tobacco industry. I have commented in previous Dean's Newsletters (see: http://deansnewsletter.stanford.edu/archive/04_09_07.html#1 and http://deansnewsletter.stanford.edu/archive/04_23_07.html#7) about a proposal to enact such a ban that was brought to the Academic Council by Professors Proctor, Greely and Jackler and that sparked considerable debate –which unfortunately sometimes became unnecessarily personal. The underlying issues are serious and evoke responses, perceptions and defenses about academic freedom, the risks of creating a “slippery slope” that might spill over to challenges or bans for other sources of research support, as well as the question of whether the tobacco industry is beyond others in its behavior. I have drawn some personal conclusions but know from many discussions with colleagues in the School of Medicine and throughout the University that two important themes have emerged.
